Of course it must be recognized that in a great many family situations the law is really powerless to restore harmony. Family law is particularly a law of imperfect obligations and imperfect sanctions. In theory all family relations are subject to the legal regulation of the state. But even as to those rules that are compulsive and exclusive the state must often pursue the policy of *laissez faire* which obtained in the early law. Norms of family law often fit ill into any analytical scheme of jurisprudence which places the emphasis upon the state as the creator of law. Austin himself was driven to the extremity of holding that the head of a family fulfilled a semipublic function which made the commands he gave precepts of the positive law. Family law, which is an admixture of the law of property and the law of persons, fails particularly in regulating personal relations. The state, alas, cannot always compel a wife to love her husband or a child to respect its parents. Old codes may be found which contain many a pious but futile maxim. The French civil code decrees that "A child at all ages owes honor and respect to his father and mother." The German and to a lesser extent the Swiss civil code has, however, avoided all exhortations to domestic felicity and connubial bliss.

In the last analysis family law remains less a product of legislation than of custom. Although legislation is paramount in modern law it is almost as true now as in the Middle Ages that family law is par excellence customary law. It succeeds best when its roots are deep in national character and feeling—when it gives expression to customary modes of living and the alignment of classes. Family law in its first stages as a law of the state tends to embody only the notions of the wealthier classes and to impose them as the law of all classes. This tendency often becomes weakened but it never ceases to be operative. Many divergencies between family law and custom may be observed. Even where no legal system of community property is recog-

nized, as in Anglo-American law, the practise of the middle classes approximates it. The family customs of the immigrant are not the same as those of the native. Indeed it is no more possible to secure a real insight into the familial institutions of any given society by referring to its family law than it is possible to judge a man's character from the inscription on his tombstone. To the old fashioned jurist family law was as disagreeable a subject as constitutional law was to John Chipman Gray, the great authority on the law of property. Family law particularly requires the sociological approach. It offers an immense opportunity for an anthropology of the civilized races.

Doubtless under popular political institutions family law and customs tend to coalesce, but the process must always remain far from complete. Certainly enormous obstacles still stand in the way of any international assimilation of family law, with the result that the solution of problems of the conflicts of laws in this field is particularly difficult. Even in a federal nation such as the United States uniformity in family law has not been possible. The adherence to the principle of nationality in determining incidents of status in continental countries has made it impossible to work out any basis of agreement with Anglo-American countries which adhere to the principle of domicile.

In the East the joint household may still be observed, but already it has begun to disintegrate in many places, repeating the experiences of the West, even as the Germanic races have repeated the experience of Rome. Particularly in Japan, which has adopted a code built upon western models, a compromise between ancient ideas and modern needs is taking place. The Japanese house, or *ie*, is not legally ended even with the death of its head, and a successor is provided; but within the house the occidental biological family is recognized since parents as such exercise an authority independent of the head of the house, and property rights are vested in the individual. Nevertheless, an even wider family than the household exists, consisting of persons related by blood or marriage within certain definite degrees, and through a family council it exercises powers that are very wide when compared with those of European family councils.

In the West the "socialization" of family law is frequently urged. But such legislation as has been adopted indicates rather that it is not so much the family itself that is being legally so-

cialized as that family obligations are being transferred directly to the state, which decreasingly relies upon the family to rear its future citizens. Duties rather than rights had for a long time been emphasized in family law, but the duties, particularly those of parents toward children, remain largely unfulfilled. Particularly with regard to children has the state come to interfere more and more in order to secure for them adequate development and protection. In the United States special domestic relations or family courts have even been created to deal with family problems. But such legislation, far from strengthening the family as a legal and social unit, tends to do the opposite. It proceeds from the failure of the family and carries to its logical conclusion the individualization of family law. The family preceded the state. But in its political organization the family now tends to repeat the structure of the state.

FAMINE is a state of extreme hunger suffered by the population of a region as a result of the failure of the accustomed food supply. It is to be distinguished from the more or less constant undernourishment of chronically poverty stricken districts. Famine may be the consequence of drought, prolonged winters, cold summers, floods or plagues of locusts or rodents. The ravages of war and the devastation of rural regions during periods of upheaval may prevent adequate food production, and the breakdown of systems of distribution may affect regions dependent upon importation for food. Other less direct factors may contribute to famine. Deforestation may increase the danger of floods. Overpopulation in some regions may reduce the acreage per farm until it is barely sufficient to afford miserable sustenance in good years, precluding the storage of surplus for lean seasons.

Except in tropical regions the peril of famine in primitive society has always been great because of crude methods of food production and the absence of adequate methods of storage. Early civilizations were also subject to famine. Egypt was afflicted with both drought and locust plagues. In ancient China and India primitive agriculture and inadequate transportation combined to intensify the disastrous results of drought. The development of large urban populations in Greece and Rome increased the difficulties of securing sufficient food in years of bad harvests. In mediaeval Europe, when peasant farmers living in isolated and self-sufficing communities formed the majority of the population, a crop failure in one locality meant famine even if harvests were normal only a short distance away. The approximately four hundred and fifty recorded famines from the year 1000 to 1855 were largely confined to small local regions such as Wales, Lorraine and Alsace. These dearths were caused by long, cold winters, which hindered planting, or by dry or cold summers, which prevented growth, and by floods, locusts and war. That eastern Europe was not untouched by famine in mediaeval times is indicated by the plaint of the chronicler of Novgorod.

Famine has been almost banished from the western world during the last century. The revolution in agriculture has removed food production from the list of famine factors in spite of

the vast urbanization which has occurred. The crops of a locality may be destroyed by drought, hail and frost, but the progress which has been made in the storage of surpluses and the increase in facilities for transport have reduced the effect of such disasters. Developments in food preservation such as canning, drying, pickling and freezing are also famine preventives. Poverty stricken urban dwellers may starve to death, but ample food exists. When famines do occur in occidental societies the farmers are especially affected, as in the famine stricken area in the United States in 1930-31, when the poverty of the farmers made it impossible for them to purchase sufficient food from the ample supply existing in the country.

Although famines are unusual in civilized societies, there have been severe famines in modern Europe and there are still chronic famine areas in the world. The Irish famine from 1846 to 1851, which was the most disastrous in western Europe in the nineteenth century, was caused by the potato blight. It resulted in over a million deaths and was a factor in the emigration of a million and a half people within a decade. The famine was intensified by the miserable poverty of the people who were dependent on potatoes for sustenance. In 1841 almost one half of the farms in Ireland contained less than three acres, making it impossible for the farmers to accumulate reserve supplies.

Russia was scourged by major famines eleven times between 1845 and 1922. Although drought was the immediate cause of these crop failures, the steadily increasing population and progressively smaller farms contributed. In 1905, although 12.5 dessiatines (of 2.7 acres each) were considered necessary for the adequate sustenance of a family, 70 percent of the households in 47 regions had fewer than 10. The peasant population suffered even in normal times from lack of food because of the extremely primitive agricultural methods, and as a result in 1890 the death rate was higher by 30 percent in rural districts than for Russia as a whole. Since no adequate reserves could be maintained, even a partial crop failure precipitated a famine. Added factors in the famine of 1921-22 were the international blockade against the Soviet Union, the severe decrease in planting due to counter-revolutionary disorders and the opposition of the peasants to foodstuff requisitions.

In north China the scant 21 inches of rain falls in the spring, making the wheat crop possible, and in the summer, when millet and kaoliang

are planted. Failure of rain at either time is serious; failure at both times is fatal. Some of the rivers silt up, partly because of deforestation. A break in the dikes on such rivers means floods, the severity of which is increased by the slow drainage of flood waters from the level fields. Locusts plague some regions, particularly in Shensi, where they have caused 20 of the 162 historical famines. Although 4.7 acres are necessary to raise sufficient wheat for the average family in north China, 55 percent of the farms contain 1.5 acres or less. The size of the individual rice fields is also inadequate and as a result the majority of families have scarcely enough food in normal times and cannot lay aside reserves. Insufficient credit, poor roads in the interior, the burden of large armies, foreign aggression and the lack of a stable government have aggravated these conditions and have contributed to an economy which is peculiarly susceptible to famine.

Famine in India has been defined as "only the exceptional aggravation of a normal misery." Drought due to the failure of the monsoon rains is the primary cause of famine, although flood, hail and locusts have been occasional factors. There seems never to have been a country wide drought in India. In famine regions imported food has been obtainable but the widespread and extreme poverty of the rural population has made the purchase of such food largely impossible. The agricultural workers, dependent on the produce of their land for sustenance, have almost no reserve and are prostrated in the event of crop failure. Heavy taxes, inadequate agricultural methods, the burden of a caste system containing large numbers of unproductive people and the British drain upon Indian resources have been offered as explanations of Indian poverty.

Unless relief is unusually efficient famine involves a temporarily increased death rate due either to starvation or to the increased disease resulting from weakened resistance. The aggregate death list from famine would be as staggering, were it carefully kept, as those of many wars. Although the data are sadly incomplete, the greatest death toll has probably been that in the widespread famines in India, China and Russia. Imperial Russia and India suffered famine nearly every year; from 108 B.C. to 1911 there were 1828 famines in China. The ten famines in India between 1860 and 1900 are estimated to have resulted in fifteen million deaths, and nine million fatalities were caused by the famine in north China from 1876 to 1879. Little is known

of the mortality of the approximately 600 recorded famines in Europe from 6 A.D. to 1855. After his study of famine in China Mallory concluded that the conditions arising from food scarcity were the main checks on population. The periodic famines in semi-arid Iran seem to have served to keep the population within the limits set by the environment. But in spite of the large death rates they occasion, famines can in no sense be considered permanent checks on overpopulation. Their temporary effects are readily compensated for in succeeding periods of relative plenty.

When a country experiences famine only as a rare and extraordinary disaster, the effect is likely to be ephemeral; but if famine is a recurring phenomenon it may leave its mark on the social, economic and spiritual life of the society; it may be a factor in epidemics, a motive for migration and a regulator of population growth. In considering famine as a possible factor in migration one must distinguish between the wanderings of small groups of people and the larger movements which are more clearly migratory. Famine conditions in one region have often prompted a stricken population to move into more favored places. Delafosse records Wadaian depredations in western Darfur about 1830, stimulated by famine in Wadai. Petrie believes that the famine conditions of dry years caused the pastoral races living in arid regions to migrate to the richer lands. It is less certain that dry periods and famines precipitate larger movements of peoples. It has been suggested that the Arab migration started from a great famine in Arabia in 600 A.D. and was kept in motion by a series of dearths from 816 to 1072, and the prolonged drought on the steppes about 3000 B.C. seems to have urged groups of nomads westward and southward into the northern plain and Hungary. A series of droughts with frequent famine may have urged nomadic tribes to move in search of better grazing land, but that famine has been a significant factor in inducing the people of a settled economy to migrate seems open to doubt. The agricultural regions of China and the Pueblo culture of America have suffered countless famines and have passively withstood their effects or have developed a reasonably famine proof economy.

The judgment of epidemiologists is that disease is the invariable consequence of famine. The debility resulting from lack of food or from vile food substitutes paved the way for cholera, typhus and malaria in India, and the famine in

Florence in 1347 was the forerunner of the plague of 1348. Famines do not produce new or special epidemics, but under famine conditions the typical diseases flourish. The so-called famine typhus is spotted fever, and the diseases which followed the famines in Upper Silesia in 1848 and in Finland in 1867-68 were the malaria and typhus common to the region.

Famines are reflected in religious belief and ritual. The Hopi Indians, for example, who are dependent on corn, have a series of extremely elaborate corn and rain producing ceremonies, of which the snake dance is the best known. There is a distinction between ritual for the production of food and rain and the ceremonies which take place after famine or drought ensue. Fertility rites to prevent famine abound in primitive and ancient religions and have their modern counterparts. In Biblical times famine was often considered a sign of the wrath of God (see *II Samuel* xxi), and the idea survives in the prayers for rain offered by many Christian churches in times of drought.

The development of some primitive social customs may have been conditioned by food scarcity. Sumner interpreted abortion and infanticide to be often protective devices against famine and other calamities arising from overpopulation. In Australia, for example, where limited food and water made wandering necessary, women with two infants were unable to accompany their husbands. Cannibalism has often occurred during famine, but does not seem to owe its existence as a regular practise to the absolute lack of food. Curschmann listed the following socio-economic changes among the aftereffects of mediaeval European famines: an increase in the price of grain, a rise in rates of interest, a general desertion of stricken villages and farms, the impoverishment of the people, the destruction of livestock and an increase in restlessness and disease. Other students have seen a connection between the very prevalent famines in Europe in the Middle Ages and religious exaltation and mania, group movements and political and social turbulence. Occasionally some constructive institution has risen from a famine situation, as did Raiffeisen's rural cooperative credit societies, which were organized in Germany to meet the needs created by the famine of 1848.

Where famines are frequent some attempt has usually been made to store food or water. In savage societies the storage of food to carry the tribe through dearth has been the most preva-

Encyclopaedia of the Social Sciences

lent method of famine prevention. The New Zealand Maori, the Hopi and Moqui of America, for example, regularly store food as an insurance against scarcity. Traces of grain and fruit stone storage rooms have been found in the Swiss lakeland prehistoric remains. The irrigation systems of primitive cultures such as those of Easter Island and the Arizona Pueblos play a role in famine prevention. The Badarian culture in lower Egypt about 12,000 B.C. used underground granaries, and the storage of grain in conical structures under the supervision of a superintendent of the granaries was systematically carried out under the pharaohs. The Incas confiscated and held in storehouses all surplus foodstuffs in an effort to maintain a three-year supply from which public distribution could be made in time of dearth. The canal and irrigation system of Sumer (3000 B.C.), the irrigation works of the Incas, the flood prevention dikes on the Hwang Ho (2000 B.C.), are illustrative famine prevention activities of ancient civilizations. In India before the advent of English rule the native rulers and the wealthier farmers maintained haphazard reserve supplies in good years. Probably the first to introduce vigorous famine relief in India was Muhammad Tughlak, who in 1343 distributed six months' supply of grain to the inhabitants of Delhi, made grants from the treasury for farming and well digging and unsuccessfully attempted to introduce compulsory labor. Shah Jehan, who in 1630 made extensive doles of food and money and remitted taxes, initiated the extension of relief to rural districts. Irrigation was the most important preventive effort against famine in this early period.

In mediaeval Europe occasional storage of grain was the only means used to attempt to prevent food scarcity with the exception of scattered regulatory laws. The English government placed various prohibitions on forestalling and engrossing—practices closely akin to modern speculation and monopoly. The Assize of Bread issued in 1202 was an attempt to prevent speculation in bread by varying its weight with changes in the price of wheat. This and the later Assize of Bread and Ale issued by Henry III in 1266 were antispeculation or antimonopoly acts rather than price fixing laws and were the products of an economy in which the monopolizing of food in times of dearth increased the hardship experienced by the poor. The famine relief of this period was left largely to the casual alms of the wealthy and to the church. Charlemagne considered the famine of 780 to be God's punish-

ment of man's sin and consequently ordered masses said. His famine relief program included the conservation of food, the prohibition of food export, the regulation of corn prices and the maintenance of feeding stations, but this program was not followed in later years by other princes or by cities, save for the occasional prohibition of exports and regulation of grain prices. The series of bad harvests all over Europe from 1527 to 1536 probably hastened the development of poor law relief in England and on the continent, through which some social responsibility was assumed for destitute persons.

Progress has been made both in famine prevention and in famine relief. The United States and England, impelled by a humanitarian spirit, by political purposes or by the obligations imposed by empire, have participated in efforts to alleviate and conquer famine in China, India and post-war eastern Europe. The Russian peasant under the czarist regime had a legal claim against the government for famine relief, and each community was required to keep an emergency grain store and was allotted famine relief funds; but in practise this system usually collapsed. During this same period the British were developing a system of famine prevention and relief in India, where by 1860 the problem of relief had become the question of how much to pay the famine victims employed on public works and how to force all able bodied men to work. Famine sufferers were divided into those who could labor on public works, those who could do light work in poorhouses and those who were unable to leave their homes—a classification which has since formed the basis for relief work. In 1869 the government introduced the important principle of granting tuccavee, or cash relief, to farmers in order to enable them to remain on their farms for the following year. The famine code of 1883 recommended village relief in preference to the much disliked poorhouse, which was to be retained for the aid of wandering famine victims, urged that work be offered immediately before efficiency was impaired by debility and that tuccavee grants be supplemented by tax remission. With some unsuccessful modifications this plan was applied in the famines of 1896-99 and 1899-1900. In 1906-07, although the food supply failed for nine months, the development of acute famine conditions was prevented by the improved condition of the farmers, extended irrigation, increased loans at low interest to landowners who employed famine sufferers and greater village

relief. The efficiency of famine relief was increased by the growth of the railway system from 4255 miles in 1870 to 39,049 in 1927.

Although spasmodic attempts at both prevention and relief of famine have been made in China for centuries, determined efforts date from the participation of foreign societies. In the severe famine of 1920-21 the American Red Cross and the China International Famine Relief Commission joined in a relief program which expended thirty-seven million Chinese dollars, one half of which was under international auspices. The international committees alone fed almost eight million persons during the peak of the famine. All able bodied members of stricken families were offered employment on public works, usually roads or dikes, under the supervision of famine commission engineers. The wages were placed below the normal wage scale and where feasible the expenditures were regarded as loans to be subsequently repaid by the community.

During the war and post-war years famine conditions developed in Poland, Armenia, the Ukraine and Russia, and the governments of those countries were unable to render adequate relief. American agencies led in relief efforts, although considerable sums of money were expended by governments and societies in other countries. The greatest of these famine relief programs was that in Russia from 1921 to 1923, in which roughly \$70,000,000 was expended by the following organizations: the Soviet government, \$11,387,000; the United States government, \$22,662,000; the American Relief Administration, \$23,440,000; the American Red Cross, \$3,805,000; American religious and charitable groups, \$5,017,000; European governments and relief organizations, about \$4,000,000. The disbursement of 85 percent of the funds was administered by the American Relief Administration. The combined American relief organizations fed a total of eleven million Russians at the peak of the famine, while an additional million were fed by other foreign agencies. The relief administration established a central organization in Russia, which received supplies and disbursed them to urban and rural kitchens, where relief was directly administered in the form of cooked food. Seed grain and medical relief were also dispensed. By the latter part of 1922 relief to adults was discontinued, and in June, 1923, the American Relief Administration withdrew from Russia.

The conflict between the recognition of gov-

ernment obligation to assist famine victims and the procedure of delegating relief to private agencies dependent upon uncertain individual contributions is still raging. In the United States during the famine of 1930-31 the federal administration opposed the use of government funds for food relief to the farmers suffering from drought, contending that there should be no interference with private relief measures.

China remains the only major chronic famine area; and the near future holds no promise of sufficiently widespread improvement in agriculture, limitation of population and other social and economic changes which would prevent famine recurrence. India although constantly threatened with local food shortage has evolved a system of relief which has mitigated sufferings in famines in which poverty rather than actual food shortage is the chief characteristic. The Soviet government has made prodigious advances in increasing agricultural output through its government farms and by the socialization of peasant farms, and as a result the possibility of future famines in the Soviet Union is slight.

Population experts have predicted an increased pressure of population on the margin of subsistence which unchecked might be expected to breed increased famines in the world of tomorrow. Such prophecies, however, are based on a projection of present net population increases and on present methods of agricultural production. They do not take sufficiently into consideration the likelihood of future modifications of population increases and of enlargement of the food supply.

FANATICISM is the anglicized form of a word which in ancient times was used of priests supposed to be inspired by divinity. This early religious association is still influential in current usage. By the sixteenth century, however, if not long before, the original meaning had expanded to include forms of noisy madness having no religious basis. Shakespeare used the adjective fanatical with reference to fastidiousness in pronunciation. During the sectarian agitations in the seventeenth century immoderate adherents of the sects in England were called fanatics. The term was spoken of as coined for the purpose, and it was thought by at least one writer to have been "well cut out and proportioned to signify what is meant thereby, even the sectaries of our age." Extension of meaning has gone on in this manner until fanaticism has come to denote frenzied partisanship or blind zeal in any cause, whether religious, social or political. A list of examples prepared today would include the conduct of religious leaders like Savonarola and Jonathan Edwards, rulers like Philip II and Cromwell, social reformers of the type of John Brown and Carry Nation, certain practises of ascetics, mystics and dervishes and such emotionally charged outbursts as inquisitions, witchcraft persecutions and lynching bees.

Appearing in various forms fanaticism in its authentic occurrence is the effect of three passion components. The peculiar combination of these distinguishes it from mental and emotional states—enthusiasm, faith, loyalty and the like—of which it is a perversion and from which it differs in psychological structure and social tendency. Of these three components the most obvious is extreme narrowness and rigidity of temper. The fanatic is so excessively convinced of the truth and importance of a certain idea or feeling that every other interest, personal or social, is powerless to modify it. He may be teachable in some matters, but it is impossible for him to learn anything that would dislodge the fixed idea. The end which he selects as supreme, the path he follows to arrive at that end and the quality of the good to be obtained are never open to question. With the declaration "This one thing I do!" on his banner he marches to victory or defeat. Not only does he thus resist all influences to broaden his allegiance, whether they come as inner promptings or demands from without, but he makes a virtue of despising every experience which does not positively further his dominating purpose. If a conflicting fact cannot be ignored, he distorts its significance. Events

impinge in vain upon his adamant conviction. This blind obstinacy suggests monomania. It supports the opinion that fanaticism borders on insanity.

Combined with this intense assurance is an unyielding determination to make the fixed idea triumph over men. The fanatic is not of a meditative temperament. He finds it insufficient to make sure of the deepest truth and to order his life in harmony. He is a man of action, a fiery propagandist, an unrelenting missionary, ready to consume and to be consumed in the cause of spreading his belief. The doctrinal absolutism of Paul, Loyola, Calvin and the rest was no more inordinate than the unrelenting driving power with which each one of them attempted to subjugate the intellect, desires and will of mankind. No organization or endeavor is immune from fanatical exploitation. The history of political revolutions or of such movements as abolition, prohibition, nationalism, imperialism and industrialism proves how real this danger may be. And in whatever field of action or thought the fanatical sentiment arises, its invariable *modus operandi* is to push out and absorb other fields. When its origin has been religious, as in the case of Joan of Arc, the Jesuit order, the abolition or prohibition movements, it has intertwined itself with political parties and social forces and has entangled them in the destiny of a religious struggle. If it has developed in an economic or political situation, as, for example, in connection with communism or Fascism, it has proceeded to take over the function and authority of religious institutions or has aimed to dominate them. Regarded solely as a manifestation of propulsive energy fanaticism is impressive.

A trait no less characteristic is callousness to pain. The true fanatic's nature includes a quality of hardness which renders it uncommonly insensitive to human suffering, often to the point of cruelty. In the most developed types this insensitivity becomes a positive desire to cause suffering. The desire is frequently introverted, in which case it leads to self-inflicted torments; but it is also turned outward, mercilessly inflicting pain on others. In religious fanaticism this is motivated by a decided antipathy to the satisfaction of natural human desire. There is always a protestation of high purpose and a display of logic to give the suffering an appearance of being rational and right; but a more basic explanation is the presence in the fanatic's disposition of a deep strain of misanthropy, a strong despal of human nature. With this malivulent

attribute in mind Isaac Taylor, in a book of considerable psychological insight published a century ago, defined fanaticism as "Enthusiasm inflamed by Hatred."

Such traits operating in conjunction accomplish results, not infrequently vast results. Some of these are doubtless beneficial. In its total effect, however, fanaticism is inimical to individual and general welfare. Its extreme narrowness of aim, inflexibility and brutal disregard of all values that lie outside the scope of a limited goal constitute it a deeply disruptive force in society. The fanatic's morbid absorption impels him to deny ordinary life interests and to place a high estimate on pathological behavior; compare the compassionate theology of the non-fanatical Pelagius with the ascetic doctrine of the fanatical Augustine or the normal outlook on life of the non-fanatical Phineas Quimby with the abnormal outlook of his fanatical pupil, Mary Baker Eddy. The fanatic is, moreover, abnormally self-centered. Judged by surface appearances his tremendous activity may simulate dedication to a cause, but the deeper motive seems always to be an insatiable, if perhaps generally unconscious, desire for self-aggrandizement. Whether the fanaticism arises out of religion, politics or a class struggle, the fanatic regards himself as "chosen" for the role, and the advance of his cause is inevitably bound up with the vindication of his messianic claims. Humility is as foreign to a fanatic as a sense of humor. Equally antisocial is his unbending self-righteousness. Uncompromising foe of compromise, he places himself and his cause beyond the franchise of other minds. His program, as someone has suggested, is driven into the social structure like a wedge. The way to mutual understanding of differences is closed. Human relations are reduced to unconditional surrender or mutual defiance and the struggle for survival.

While fanaticism may appear in an isolated case it is readily spread by contagion. The extravagant ideas and the enormities of feeling and conduct which characterize it can pass from person to person by imitative repetition. In this way many succumb to the malady who would develop no symptoms of it if unexposed to an infecting source. This is evident at a time of war hysteria or during any group delirium. As a mass expression fanaticism assumes an intensified form. Nor is this only because numbers have a cumulative effect. Two other factors enter. By some susceptibility of human nature individual capacity is raised to a higher power when it

becomes a coefficient of group emotion; and when supported by group symbolism an individual readily drops back into ways of feeling and acting more primitive and wild than are otherwise customary with him. Typical mass fanaticism—a Spanish Inquisition, a witchcraft persecution, a racieriot—is socially irresponsible, ruthlessly malevolent and enormously powerful. An individual fanatic even of the pronounced type is relatively insignificant from the social point of view if he is unsupported by mass fanaticism. If he grows to heroic proportions as a social force, it is because he proves able to call forth in numbers of his fellows fanatical psychoses similar to his own and to unite these into something resembling a mass ego with himself as the dominating intellect and will. As this takes place, that is, as normal persons who are not psychologically predisposed to become fanatics are affected, fanaticism enters its mature and threatening phase.

The causes of fanaticism are very imperfectly understood. They are doubtless biosocial in nature. Neurological abnormality is evidently at the bottom of pronounced cases, with unhappy environmental conditions supplying the explosive stimulus. All of these pronounced types indicate the presence of strong ambition, especially a yearning to occupy a position of prominence in the eyes of men, an ambition which is frustrated by personal handicaps, accident or the circumstances of life. Usually some inhibiting fear or deep sense of insecurity is present also. Very often there appear to be sex complications, shown in the value placed on mystical love trances or by a surrender to what in all probability are sadistic impulses. Fanaticism thus grows out of serious maladjustment of some sort. It is uniformly a compensatory activity, representing self-realization through a deflected channel. The noticeable defiance of socially approved values and arrangements may be regarded as a blind gesture of resentment against obstacles which were sufficient to thwart desires so strong that they could not be killed nor permanently suppressed.

This interpretation holds in general for the individuals who make up a mass fanaticism. In those instances where lack of information, credulity and already existing dogmatic beliefs are more or less deliberately made use of to develop a fanatical scheme, as in Bryan's anti-evolution crusade, the underlying maladjustment is less obvious but need be no less real on that account. As a matter of fact normal individ-

uals may find liberation and an enhancement of personal significance in fanatical commitments. In their daily routine these persons carry the weight of what is called civilized life. They are constrained to engage in steady labor, often in spite of strong disinclinations; they must satisfy vigorous natural promptings in socially restricted ways; they are haunted by economic insecurity and are thwarted in the realization of even moderate ambition. In a word, they are held by a system of pressures to a life more or less consciously resented. Submergence in a fanatical experience, whether this is associated with a more permanent program or is merely a temporary orgy, may bring relief. It may enable them to break through a sense of restraint and futility to a sense of liberty, power, accomplishment, dignity. It is of course all too evident that the cause in which they thus invest their energies need have no ameliorating effect on the unfortunate conditions against which they rebel.

In view of the complex nature of fanaticism, no simple remedial measures will accomplish satisfactory results. Intended cure must take cognizance of both psychological and sociological causes. Predisposing psychic causes can be dealt with only by an adequate science of neuropsychiatry. The process of education is implicated. A type of education that encourages credulity and stresses the finality or absoluteness of attitudes and ideals, thus operating to mold an adventure seeking being into a creature of mechanized habit, prepares the way for social maladjustments and irrational commitments. On the other hand, an educational process that positively encourages the experimental spirit in every undertaking and, while placing unique value upon worthy attainment, emphasizes the tentative character of all aims and achievements contributes an important quality to the kind of human living which is unfavorable to the production of fanatics. But an inescapable element of the problem has to do with the reconstruction of social institutions, especially of those harsh economic and social conditions which drive many otherwise normal human beings periodically or permanently into fanatical states and projects.

FAR EASTERN PROBLEM. The roots of the far eastern problem lie in the last decade of the eighteenth century; before the twentieth century opened it had become a recognized potential cause of war. In 1904 the war came, with Russia and Japan the antagonists and China's Manchurian provinces the stake. The victory of Japan solved but one phase of the problem, which while relatively less important today than twenty years ago remains still one of the chief sources of international friction.

Until late in the eighteenth century European influence in the Far East was slight and insecure. The hold on India exercised through the British East India Company was loose and devoid of organic political or economic connection with the homeland. Spasmodic European efforts to open up relations with China and Japan had met with little success. The Spanish and English had failed entirely. The Portuguese had a trading post at Macao on the south China coast, the Dutch had one in southern Japan, Russia was permitted to send merchants to Peking at regular intervals, the Dutch were established securely in the East Indies and the Spanish in the Philippines. After 1720 foreigners were permitted to conduct a limited trade at Canton with the "cohongs" (a few Chinese firms specifically authorized by the Chinese government to deal with foreigners), but they could not enter the city, except a small area at stated intervals. Otherwise the Far East was closed to Europe until the end of the eighteenth century, nor was there any great concern in the West that relations with the Far East were not closer. Such trade with the East as existed was in luxury commodities and while it provided profit to a limited number of individuals it had little effect on the economic and social structure of European countries.

With increasing industrialization in Europe the far eastern stake became a vital one. New markets were essential, and in India and China was half the world's population. Later, new

sources of raw materials became essential and Asia offered an untapped supply. Still later, accumulations of capital seeking profitable outlet began to flow to Asia, where a whole continent invited developments in railways, mines, construction and manufacturing. England in the vanguard of industrialization led in these developments; British imperialism was a projection of the needs of Manchester, and British pressure on China was in proportion to the productivity of her textile mills. Similarly the passing of the American frontier and America's enormous development of industry were the signal for an awakening of the United States to potential developments on the western shores of the Pacific.

A mercantilist Europe seeking only an increased export trade encountered few complications; the issue was simply one of compelling first China and then Japan to permit the free entry of foreign goods. Between European powers there was normal commercial competition in discernment of demand and in price and quality of goods supplied. Complications set in only after industrialism had become more highly evolved, after the growth of national animosities in Europe and the exposure of China's vulnerability. Equipped with the wealth which industrialism yielded, armed with the weapons it had fabricated and driven by nationalistic egoism, the Great Powers of Europe entered a race for world conquest. England was in the van. France, recovered from the devastation of the revolution and renewed in ambition with the accession of Napoleon III, resumed its traditional rivalry with England. A unified Germany entered late but with vigor and determination and Russia set out with equal vigor to achieve the mastery of Asia. Toward the end of the nineteenth century Japan by declaring itself a contestant for the stakes of the East disturbed the balance set by European partnerships, a balance entirely destroyed by the subsequent entry of the United States into the contest. The Far East had become a prize of world politics.

The first steps in the process of western aggression were taken by England in the last decades of the eighteenth century. The East India Company was consolidating its hold on India and had farmed out opium as a monopoly, whose proceeds were to be a pillar of the Indian fiscal structure for many years. Easy access to the China market was urgent; but just because opium, declared contraband by China, was playing an increasing role in foreign trade, the

Chinese policy of isolation, growing out of insularity and a sense of superiority as well as disgust with the excesses of individual European adventurers and the clear aim of European governments to conquer, was fortified. Although the opium trade flourished, the English were restricted to the Canton co-hongs and a heavy handicap was laid on all other trade. Two British diplomatic missions to China in 1793 and 1816 failed to secure the opening of formal diplomatic and commercial relations, and in 1839 the dispute came to a crisis when a Chinese commissioner confiscated all the foreign opium in Canton. War broke out as a matter of course (other disputes were also involved) and China was compelled in 1842 to sign the Treaty of Nanking opening five ports to foreign trade and ceding the island of Hongkong to England. The United States and France thereupon secured similar privileges, including a most-favored-nation clause, which was incorporated in a supplementary British treaty in 1843 and became subsequently the ground for numerous encroachments on China's sovereignty. The court of Peking did not regard its obligations with too much seriousness; and a sudden influx of foreigners to Canton led to numerous incidents, one of which precipitated another war in 1856. An Anglo-French fleet sailed up the coast to Tientsin and an expedition to Peking sacked an imperial palace. The Chinese government agreed to permit the establishment of legations at the capital, to open more ports to trade, to make explicit provisions for extraterritorial rights, which had been vaguely stated in the earlier treaties, and to fix a conventional tariff of 5 percent. Also Christian missionary work and the opium traffic were legalized. China's helplessness was thus exposed and advantage was quickly taken of it. Russian sovereignty over territory north of the Amur River was recognized. France appropriated Cochin China, established a protectorate over Annam and after another war with China added Tonkin to form what is now French Indo-China. Great Britain occupied Burma, until then a tributary of China.

Meanwhile Japan had come upon the scene, first in one role and then another. Japan had been forced open by the United States, after Commodore Perry's naval expedition had appeared off Tokyo in 1853. Treaties opened two Japanese ports to trade, granted extraterritoriality and set a conventional tariff. Although there were incidents, punitive measures and bombardments, on the whole Japan, with greater fore-

sight than China, went out to meet its fate. Less than twenty years after the country had been torn from isolation there began a transformation which placed Japan among the world's dominant nations. Feudalism and the shogunate, which had ruled the country while the emperor remained a venerated but powerless figure in Kyoto, were abolished and the court restored to power. Missions were dispatched to Europe and the United States to study western social organization, the technology of machine production and especially the technique of modern warfare. Railways were built, telegraph lines laid, modern banks established, universal education and military conscription decreed and a constitution adopted. Factories were established and above all a modern army and navy created. Japan's chafing at the derogations on its sovereignty and its imperial ambitions waxed with progress. Its leaders recognized China as fair game and in the eighties became involved in a complicated dispute with China in Korea, which, brought to a head by Japan in 1894, resulted in war and the startlingly swift collapse of China. Japan extracted a large indemnity, recognition of Japanese sovereignty in Korea (a diplomatic formula for recognition of Japanese paramountcy), Formosa and the Liaotung Peninsula on the south Manchurian coast. The last Russia had marked for its own, and now supported by France and Germany it "advised" Japan to relinquish it. In November, 1895, Russia obtained as a reward from China the right to build the Chinese Eastern Railway, a shortcut for the Trans-Siberian Railway across North Manchuria to Vladivostok, to station military guards along the right of way and to exploit mines on both sides—in effect a grant of the territory.

There ensued now the battle of the concessions. Germany obtained a lease on the territory surrounding Kiaochow Bay in Shantung province, Russia on the Liaotung Peninsula (together with the right to extend the Chinese Eastern Railway across south Manchuria to Dalny, thus foredooming the Russo-Japanese War), Great Britain on Weihaiwei on the north coast and France on the Kwangchow in the south. All the Great Powers proclaimed spheres of influence in China—Russia in Manchuria, Germany in the Shantung area, Great Britain in the Yangtze Kiang basin and France in the south. Great Britain was formally conceded the right to name the collector of the Chinese customs, which had been administered by foreigners for a generation. France obtained the right to supervise the

Chinese postal service. Then began financial penetration in earnest on lines already developed in north Africa: invasion by railways, by loans and by concessions for monopolistic exploitation of natural resources. Peking became a morass of international intrigue with diplomats and bankers bidding for the favor of Chinese officials and browbeating them. In the meantime China had been compelled to alienate areas in numerous cities as settlements and "concessions" for the residence of foreigners. These had expanded and developed as commercial centers, drawing off Chinese economic vitality and capital. China made a despairing protest in the Boxer uprising of 1900 but was quickly punished by an international expedition and forced to pay an indemnity of about \$330,000,000. The partition of China seemed imminent, when the United States, having recently acquired the Philippine Islands and an interest in the Far East, entered the arena and in the Hay notes pledged the powers to respect Chinese administrative and territorial integrity and to maintain the Open Door, i.e. equality of opportunity for all trading nations. The pledge was both taken and observed in a Pickwickian sense.

For ten years there had been in progress a diplomatic duel between Japan and Russia in Korea. When Russia now moved to foreclose on Korea, Japan struck out and victorious exacted revenge for the "advice" of ten years before by taking over Russia's rights in south Manchuria. Japan also tightened its hold on Korea and in 1910 formally annexed it, thus becoming a world power and a claimant for far eastern paramountcy. All the races of the East, electrified by this first humbling of a white by a non-white people since Kublai Khan, saw after two generations under the heel of the western invaders a glimmer of hope; the white man's prestige began to fade and a new factor, possibly the most important, was injected into the far eastern problem. Another was injected a few years later when the Manchu monarchy was succeeded by a Chinese republic, which while it has never functioned as such has been a forcing bed for seeds of nationalism now bearing fruit.

The World War opened a new stage in the history of the far eastern problem. The pressure on China was not lifted but its direction changed. With Europe preoccupied elsewhere Japan, an ally of Great Britain, entered the war early and took over Germany's leasehold in Shantung. In 1915 Japan presented its Twenty-one Demands, whereby it would have obtained possession until

the end of the twentieth century of south Manchuria and Kiaochow region. Because of strenuous opposition in China and the tacit disapproval of the United States Japan withdrew Group v of the Demands, which would have made a Japanese protectorate of China, and proceeded in less obvious ways to achieve the same end. It subsidized Chinese political factions with loans and obtained in return mortgages on Chinese national resources and for a time control of the Chinese government. With Siberia disorganized after the Russian revolution and the Bolshevik regime in disfavor with the Allied Powers, a joint Allied expedition to Siberia was arranged. Although it was agreed that each participant power would send only 7500 troops, Japan sent about 70,000 and in addition began to play the same politics with Siberian as it had with Chinese factions. The Armistice, although it came prematurely for her imperialistic plans, found Japan well on the road toward consolidating mastery over all eastern Asia.

The United States, irresistibly drawn toward and then across the Pacific, watched events in the Far East with disquiet and immediately after the Armistice began making its displeasure felt. At the peace conference President Wilson openly and strenuously objected to Japan's demand for the transfer to itself of all German territorial and economic rights in the territory surrounding Kiaochow Bay. Wilson's final acceptance of an informal Japanese promise to return the territory and retain only economic rights was disapproved in China and in the United States, and the Shantung provisions had much to do with the United States Senate's refusal to ratify the Treaty of Versailles. China refused to ratify and there arose in China a wave of virulently anti-Japanese sentiment, culminating in a boycott of Japanese goods. The presence of both Japanese and American troops in Siberia and pointed American inquiries as to when Japan proposed to reduce the number of its troops did not make for harmony. An Inter-Allied Committee was operating the Chinese Eastern Railway and there occurred a succession of conflicts, the Japanese seeking to use the railway to extend political and commercial influence and the Americans seeking to thwart them. With ominous clarity an issue emerged in the Far East with the United States on one side and Japan on the other. On the Japanese side there was a sense of frustration, for which the United States was held to blame. On the American side there was suspicion, anger at the march Japan had stolen

on the world during the war and perhaps an unexpressed sense that an area marked by America for future exploitation was being closed.

The impending expiration of the Anglo-Japanese alliance brought the issue within the scope of world affairs and made it both concrete and inescapable. Simultaneously the United States, Great Britain and Japan had entered a naval race. On American initiative a conference was convoked to discuss limitation of naval armament, and on Great Britain's proposal the conference was extended to include political questions in the Far East. Thus Great Britain's choice between Japan and the United States could be merged in other decisions and lose its sharpness. The conference in Washington (November, 1921-February, 1922) was attended by nine powers having interests in the Far East. An agreement was reached setting a limit on the building of capital ships for a period of ten years and fixing a ratio of 5-5-3 for Great Britain, the United States and Japan. No such concrete action was taken, however, with regard to political issues. The cause of international rivalries in the Far East, the system best described as imperialism, was largely evaded or at most dismissed with statements of general principles. Fundamentally Japan's fight to leave the status quo untouched was, with British support on all major issues and without serious opposition by the United States, victorious. China demanded restoration of all its sovereign rights; that is, a nullification of the gains made by the Great Powers during seventy-five years. For this none of the Great Powers showed any disposition. Japan agreed to evacuate Siberia; the return of the Kiaochow region to China was settled; Great Britain and France agreed to return ports leased as naval bases and renounced their spheres of influence; and the withdrawal of foreign post offices on Chinese soil was conceded except for the leased areas. But all the important territorial leaseholds and settlements were retained, as were the privileges of extraterritoriality and control of China's tariff. Finally, the nine powers joined in a new declaration of the principles which had hitherto bound them in theory to respect China's integrity. In a separate pact, which superseded the Anglo-Japanese Alliance, Great Britain, the United States, France and Japan pledged themselves to respect each other's rights and possessions in the Far East. This Four Power Pact also provided that no new fortifications or increase of existing fortifications be undertaken, exceptions being made for the Pacific coast of the United

States and Canada, Panama, the Aleutian Islands, Hawaii, New Zealand, Australia and the then projected British base at Singapore. Essentially the agreement, by immobilizing Great Britain, the United States and Japan as far as naval bases were concerned, largely immobilized their navies with respect to aggressive action. Thus, while the Washington Conference touched the far eastern problem only in its superficial aspects, it had pronounced psychological effect, allaying tension between Japan and the United States and averting a naval race.

Other forces were in the making, however, which were to dwarf the Washington Conference to the proportions of a minor political incident. Until the World War only the results of the penetration of western military power and finance were to be seen in the Far East. But now the results of the penetration of western ideas and ways of life began to manifest themselves. The establishment of the republic in China had released new influences in the younger generation. The rise of Japan to the status of a world power, western education, the radiations from the foreign cities established on the coast, the movement of the world currents of the nineteenth century, especially the tides of nationalism and democracy, all were producing their effects in the Far East no less than in the Middle East and India. The Wilsonian doctrine of world democracy and self-determination for small nations had in the Far East an effect subversive of the established order. Moreover, the war propaganda of both sides wreaked moral devastation, for each convincingly pointed out the enormities of the other to the eastern peoples whose support they sought. The white man's prestige was fading fast. China's bitterness at the cynicism of the Versailles conference, at which it sat as one of the victorious Allies only to find that part of its territory had been secretly bargained away to another ally, and then its chagrin at returning empty handed from the Washington Conference provided a climax.

Meanwhile Russia had reemerged. The attempts to set up counter-revolutionary governments in Siberia had all been fiascos. Japanese intrigues and the tactlessness of its military commanders turned Siberian sympathies antiwhite and pro-Moscow. A buffer state, the so-called Far Eastern Republic, was established in 1920 and in 1922 incorporated as part of the Soviet Union. The Soviet Union signalized its reentry into far eastern affairs in a unique manner by formally offering to cancel treaties concluded

between the czarist government and China and to renounce all imperialistic privileges and territories wrested from China. In 1923 Adolph Joffe, Soviet diplomatic representative in the Far East, came to an understanding with Dr. Sun Yat-sen, whose party, the Kuomintang, had overthrown the monarchy and was now remaking itself as the Nationalist party. Joffe repeated the Russian renunciation of imperialistic spoils and stated Russia's recognition of the unsuitability of communism to China. The Soviet Union, however, made only a vague promise about the status of outer Mongolia, which it was then and still is occupying, and also stipulated that its joint rights in the Chinese Eastern Railway be safeguarded. On this basis what was tantamount to an alliance was concluded. In the autumn of 1923 Michael Borodin was sent from Moscow to Canton as an adviser to the Nationalists with a group of Russian officers who helped establish a Nationalist military academy. Most of all, the Russians taught the Chinese to organize and spread propaganda and by 1926 a wave of Nationalist, anti-imperialist propaganda had swept the country. On its heels came the Nationalist armies, which early in 1927 held practically all China south of the Yangtze Kiang. The rallying cry of the Nationalists and their army was "Down with Imperialism"; their program was the cancelation of all the "unequal treaties." Antiforeignism was rampant; and although actual attacks on the persons of foreigners were few, foreign treaty rights were openly flouted. In March, 1927, after the capture of Nanking by the Nationalists there came the openly organized assault on foreigners and a number were killed, provoking Great Britain and the United States to send "defense forces" to Shanghai. The situation was explosive, but passed before a fuse was actually lighted.

What diplomatic requests at Versailles and Washington had failed to achieve force had achieved quickly, and the foreign position was shattered. Some elements in all the Great Powers would have welcomed intervention in China and the imposition of a "benevolent trusteeship." But there was little public response; public treasuries could ill support necessary armies of occupation and military administrations and responsible governments had to confess their helplessness and watch hard won spoils drifting out of their possession. Making a virtue of a weakness they issued statements recognizing the justice of China's "legitimate aspirations." They did nothing, however, to implement this recog-

nitition and the crisis was escaped by a new development.

Despite Joffe's statement that China was not ready for communism, a Chinese Communist party had sprung up and allied itself with the Kuomintang. It was conducting an active propaganda, and the Communist leaders threatened by 1927 to become preponderant in the councils of the Kuomintang. In that year the Communist wing, with Soviet encouragement, made a formal effort to obtain substantive control of the Kuomintang Central Executive Committee and the break came. The Russians were evicted and the party formally severed relations with the Chinese Communists. Late in December, 1927, after an abortive Red coup in Canton, for which the Nationalist government at Nanking elected to blame Moscow, relations with the Soviet Union were broken, all consular and diplomatic representatives deported, and there began an intensive drive against Chinese Communists, including wholesale proscriptions, which drove them underground. The halt in the antiforeign campaign caused by the split in the Kuomintang was only temporary. In 1928 the Nationalists resumed their military drive, captured Peking, the capital and seat of the foreign legations, and again became peremptory. Military success was recognized by the relinquishment of foreign control over the Chinese tariff, the United States taking the lead in negotiating a new treaty. In January, 1930, China officially abrogated the right of extraterritoriality. It did not, however, put the decision into effect and a few of the powers insisted on postponement or graduated abolition. In actual practise, except in the area occupied by foreign troops, the Chinese were taking jurisdiction by *force majeure*. In short, while vestiges of imperialistic control in the old form survive they do not function. The liquidation of all of them except the International Settlement of Shanghai, which will for a time remain a lone outpost of foreign aggression, seems near at hand.

Manchuria is still in a state of political, economic and social solution. Japan retains its leasehold of Kwantung on the Liaotung Peninsula, where it has developed Dairen into a great port and industrial center, as well as control of the South Manchuria Railway, economic suzerainty over all of south Manchuria and an unofficial but effective veto power on political action by Chinese authority. The Soviet Union has reasserted itself once again in north Manchuria, after being eliminated unofficially but completely from

Harbin and from the railway, despite the agreement of May 31, 1924, whereby the Chinese Eastern Railway had been restored to joint Soviet-Chinese management (China having an active voice in contrast to pre-war years). Chinese procedure in general in China proper as well as in Manchuria has been slowly to push the foreigner out while preserving juridical appearances. In north Manchuria emboldened by success it resorted to direct action, suddenly seizing the railway in May-July, 1929, deporting some Russian officials and arresting others. A Soviet punitive expedition compelled China to restore the status quo pending negotiations for a definitive statement of future relations.

There is every indication that the controversy is being taken out of the area of politics by virtue of Chinese mass emigration from the crowded and impoverished northern provinces inside the Great Wall to the undeveloped but fertile Manchurian plains. It is estimated that between 1925 and 1930 from 500,000 to 1,000,000 Chinese have gone north every year in what constitutes one of the significant and dramatic mass movements of recent times. They are establishing themselves on the land, in the towns and in the new towns arisen as a result of Russian and Japanese development. They are going into business, establishing factories, mills, modern banks and trading houses and seem in a fair way to capture the Chinese market proper. Most of all, they are building railroads. Since 1925 Japan and China have engaged in a railway war in Manchuria; Japan aims to drain off Manchurian products to Dairen via the South Manchuria Railway and China to draw them off into China proper, either to Tientsin, via the Peiping-Mukden Railway or to a new port planned for Hulutao. Again China is reversing the process which the aggressive West used against it before. Whereas the powers were content to leave China juridical sovereignty over its territory so long as they could by economic and financial controls wield real hegemony, now Japan is being left with juridical control of south Manchuria while China is proceeding to rule it economically. While Japan has adopted diplomatic policies based presumably on its need of an outlet for surplus population, in twenty-five years only about 200,000 Japanese have gone to south Manchuria. Whether Japan will be able to resist the constricting pressure of the Chinese mass, unlike all other peoples which have come into contact with the Chinese on their own soil, is highly problematical. Had the Chinese remained in a

state of handicraft production, economically decentralized, Chinese settlement of Manchuria would have given Japan a source of raw materials and a populous market. The prospect now is that Manchurian orientation will be toward China proper, economically and therefore politically.

The population question in Japan is only an ancillary phase of the far eastern problem, but it is a phase which provides an added element of friction to the contest between the United States and Japan over the future of China. Like all other Asiatic peoples, Japan has always bred beyond means of sustenance. With the annual excess of births over deaths estimated at over 800,000, the Japanese have sought the usual outlet through emigration. Since all the countries in the Pacific basin have been closed to Japanese immigrants by the Gentleman's Agreement with the United States in 1907 and congressional enactment in 1924 and by similar action on the part of Canada, Australia and New Zealand, there appears to be no solution for Japan's population problem save such as industrialization offers, with exports to pay for the necessary purchase of foodstuffs abroad. This in turn is dependent on the tenor of Japanese-Chinese relations, since the Asiatic mainland is the logical outlet for Japanese manufactures. Japanese policy from its rise in 1894 until after the Washington Conference was aimed at assuring this market to itself by conquest or at least domination. The result was a ferocious hostility in China: wherever a choice was possible the Chinese bought from anybody but Japanese. The diminishing power of the Japanese military party, a survival of the old feudal classes, has enabled the new commercial and financial classes to make themselves felt. With occasional intervals of relapse to the older policy Japan has pursued a line of conciliation since the conference. If good will prevails between Japan and China, Japan may find an outlet for its industrial products and a secure foundation for its new social and economic structure. It will not have a monopoly over China's natural riches or command its market. Like all other great powers which once had ambitions for mastery over China it will lose such advantages as inhere in monopolistic control. But these are dubious when compared with the development possible only under native autonomy. Japan will buy and sell in open competition. It will have the advantage over other countries which derives from geographical propinquity. An industrialized

China will buy more, not less, from Japan, since its demands will be increased by a more complex economic organization. It will be, as no materially undeveloped land can be, a market for heavy manufactures as well as cheap consumer's goods. That way, perhaps, lies not only peace between China and Japan but the elimination of the Far East as an area of international conflict and ultimately war.

There is more to the far eastern problem than China, but all other aspects are dependent; the trend of each will follow the magnetic drift of what happens in China and between the Great Powers and China.

The far eastern problem has evolved now into a general social rather than a diplomatic question; it is less a matter of imperialist politics than of broad social trends. The subtle phase of imperialism introduced with the development of economic and financial penetration passed with the emergence of nationalism in the East. The East has regained its political integrity at the price of losing its cultural identity. The West has lost its political control of the East as the result of a cultural triumph, the westernization of China and Japan. And the future disposition of forces in the Far East, the relation of the Far East to the whole world and of the component parts to one another, hang on the outcome of this westernizing trend.

Japan's pre-war transformation was exterior only, industrialism being superimposed on a feudal social structure. Only since the end of the World War have the full implications of industrialism made themselves felt. Only recently has an urban proletariat been formed and the labor problem begun to fester. Feudal loyalties and the harmony of the old system are shattered; the perquisites of the upper orders are challenged for the first time; class consciousness is growing as it has in the West. These disruptive forces are intensified with every year and their pressure is slowly compelling a ruling class to yield, as with universal suffrage and labor's right to collective bargaining. In other words, despite the rapidity of its transformation after 1870, Japan is only now beginning to feel the full influence of westernization. But whereas Japan succeeded in establishing a basis before starting on its transition to the new order, China did not. China is literally in flux, having cut itself from its past more deliberately and remorselessly than Japan, resolutely determined to make itself over on the modern pattern of mechanization. The dislocations of the new order are already manifest: there

are a labor problem, an industrial slum, a budding capitalist class, class conflict. Added to these are the results of the progressive sterilization of the old economy of handicraft production before the more virile and effective factory. With its old bases undermined before new ones have been laid, China's whole structure is swaying, as the breakdown in government, civil wars, banditry and general social ineffectiveness indicate. Nor has the break of the Kuomintang with Russia eliminated communism in China.

So long as unchanging economic conditions left China socially static there was no social problem to be reflected in political controversy. But with the first consequences of the introduction of factories and the disruptive effects of western ideas, submerged social discontents have come to the surface. Communist propaganda was not wholly exotic and its seeds fell on fertile soil. Since the World War there has been a growing element in China which has felt that the evils of industrialism, as manifested in the West, can be dealt with only by prevention. It does not want China to go through the cycle that Europe and America have followed since 1800. Part of this element lent sympathetic ears to Russian propaganda and went over wholly to the communist cause. A still larger part, among whom Sun Yat-sen must be included, refused to accept the whole of Marxist ideology. While accepting the principle of social control, it rejected economic determinism as the exclusive social motive force, the class struggle as the only way to solution and the dictatorship of the proletariat as the only instrument. There is another element which, repelled by the excesses following on the gulping of communist propaganda by illiterate masses in 1926, recoiled against any program of social control. While China is not yet sufficiently adapted to western political organization for ideas and programs to express themselves clearly in parties, the conflicting schools of thought are reflected in the political struggles which delay unification. Most of what is called communism in China is not programmatic or reasoned. It is rather an inarticulate protest against the cumulative suffering of the last twenty years. Communism has given it phrases to which to attach itself. But even if Russian communism were completely eliminated, social inequalities would continue to manifest themselves in political struggle.

There can be no real stability in the Far East until China has completed its transition or definitely failed. Whether China is to break up and

fall a prey to stronger powers or, rising to new heights of power, is itself to help reshape the whole world is conjectural. What remains a constant factor in world politics is that the Chinese, numbering almost one quarter of the world's population, are even today sufficiently vital so that they are expanding over Asia, north into virgin Manchuria, south and east along the coast as far as India. Everywhere from Canton to India whites rule somnolent native peoples, while Chinese direct economic life. They are the small traders in distant outports, the merchants, bankers and of late the factory owners in the cities. Should China be revived by the dynamic of the machine it will once again share the mastery of the world. This will not, however, come about in the manner once visualized. The Chinese nation will not overrun the world by sheer displacement, by the lava flow of the excess of a population which reproduces at a rate beyond that of other peoples, especially the European races. While the application of science in China will tend to reduce the death rate, the creation of a literate urban industrial population with a higher standard of living and access to medical knowledge, including that of birth control, will tend to reduce the birth rate. The family system and the veneration of ancestors, which have been the moral and philosophical stimulus to large families, are already losing their compulsions. The curve of population in China as elsewhere will flatten. Machine production and preventive medicine will leave the Yellow Peril a figment of journalistic imagination. If China becomes a decisive force in the world, it will be because what is normally the largest race in the world, situated on a rich continent, has acquired the new instruments of power and wealth. But when it enters into the world exchange of commodities it will be as seller no less than as buyer. Western premises of unlimited industrial expansion by filling up the vacuum of the undeveloped parts of the world, which incidentally would remain each a continuing vacuum, must be drastically revised. While China's 400,000,000 people constitute the world's greatest unexploited market, Chinese manufacturers, merchants and bankers will exploit it themselves, making their own cheap products and with them also entering world competition. This is not to say that the industrialization of the East will not be an economic advantage to the West. Benefit will come not from continued increase of western exports as in the nineteenth century but in a wider diversification of exchange after the in-

dustrialization of the East is completed. The first stages will be costly to those countries whose economic structure is based on dumping of cheap products in such lands. For example, the growth of the textile industry in China and Japan and India has since the beginning of the twentieth century shattered beyond repair what was in the nineteenth century the basis of English economic supremacy, the export of textiles. As this process goes on, Great Britain will suffer from compulsory economic reorganization following from the scaling down of one of its principal industries. This fact takes on momentous significance when it is remembered that the West has already reached a stage in industrial development where overproduction threatens to become a chronic ill. It is a conclusion which follows inevitably from the rise of the modern western world with its need for new markets and its ability to seek them out through new means of communication; it follows automatically from the Treaty of Nanking in 1842, which broke China's isolation.

FĀRĀBĪ, MUHAMMAD IBN MUḤAMMAD IBN TĀRKHAN ABŪ-NASR AL- (c. 870-950), Mohammedan philosopher and political theorist. Of Turkish origin, al-Fārābī studied in Bagdad and afterwards resided in Damascus. He was known especially for his commentaries on Aristotle and other Greek writers and was a significant figure in the history of Moslem scholasticism. In several works he tried to reconcile the philosophies of Aristotle and Plato.

Al-Fārābī's political speculations are contained in a pamphlet on civic government, *As-siyāsatu-l-madīniyyatu* (tr. into German by F. Dieterici as *Die Staatsleitung*, ed. by P. Brönnle, Leyden 1904), and another on the model city, *Risāla fī arā' ahl al madīna al-fādila* (ed. by F. Dieterici, Leyden 1895, and tr. into German by him as *Der Musterstaat*, Leyden 1900). These treatises cover much the same ground; they deal largely with theology, physics and physiology. He regards the ideal city as an organism or hierarchy analogous to the human body; the sovereign, who corresponds to the heart, is served by functionaries who are themselves served by others, until a lowest class is reached which only serves. The sovereign should be perfect both morally and intellectually; and should no one man possess all the necessary qualifications, the sovereignty should be shared by as many as will together satisfy the requirements. The ideal city is one wherein the object of the association is the happiness of its citizens; this can be realized only when the soul is freed from the body. The inferior cities follow other aims, such as pleasure, wealth, victory, honor and liberty.

These speculations are reminiscent of Plato's *Republic* and Aristotle's *Politics* but by no means reproduce those works; indeed, al-Fārābī is unlikely to have understood them, since he had had no experience of republican government. Hence his cities seem purely imaginary, and he can adduce no illustrations either from the cities

of his own world or from those of ancient Hellas. His analysis of the virtues and talents which a sovereign should possess may have influenced later political speculation by Islamic writers, whose analyses are much the same.

FARM. There are several current ideas, more or less conflicting, as to what constitutes a farm. The term itself derives from a verb meaning to lease and indicated originally any plot of land leased, and by extension any plot of land used, for agricultural purposes. The varying connotations which the term has had in different countries and periods furnish an interesting commentary on changing agricultural situations and ideals.

A farm is defined by the United States Census of Agriculture as: "... all the land which is directly farmed by one person, ... either by his own labor alone or with the assistance of members of his household or hired employees. ... A 'farm' as thus defined may consist of a single tract of land or of a number of separate and distinct tracts, and these several tracts may be held under different tenures, as where one tract is owned by the farmer and another tract is hired by him. When a landowner has one or more tenants, renters, croppers, or managers, the land operated by each is considered a 'farm.' " In some parts of the United States, more especially in the west, the word ranch is often used in place of farm, as in speaking of a chicken ranch. A ranch in the strict meaning of the word, however, is a range or large area, not necessarily enclosed, used for the raising of livestock by grazing. Another familiar type of agricultural unit, the plantation, differs from a farm largely in its considerable size and the fact that it is operated as a single unit with respect to the crops grown, to the methods of control of labor and to the disposition of products.

These distinctions, however, are being slowly obliterated through changes in the nature of farming of all types. But in spite of the difficulty of definition one can outline the characteristics of the typical farm in different countries and periods. Farms in America, although they vary greatly as to type of production, size, tenure, amount and kind of labor employed and machinery and equipment used, have certain things

in common. For the most part the business organization is of the simplest sort, the function of management and ownership being combined. Farms operated by hired managers, or corporation farms, are still uncommon. Land, not labor and capital, is the most important factor of production. Practically all farms are to some extent self-sufficing; most of them supply a part and often a large part of the food, feed, labor and power needed in their operation. The size of the business as measured by the volume of sales and purchase is small.

In an attempt to characterize the typical American farm writers have frequently used the term family farm. This concept, however, has no precise meaning. To some it connotes the size of farm which will maintain the farmer and his family in accordance with the existing standard of living; others hold that it is that size of farm that will give full employment at productive labor to the farm family. Still others hold that the family farm is one of such size that the family does most of the work with some hired labor. It is recognized that the size of the family farm will vary according to the kind of people, standard of living, type of farming, topographical and climatic conditions. In some areas, notably on irrigated projects, the family farm may be a farm of very few acres, while in some localities such as the corn belt it may be as large as 160 to 320 acres. In other sections of the United States, especially in the semi-arid regions, it may involve several sections of land. Moreover, the family, the basis of the family farm, is constantly changing in size. The concept of family farm is therefore somewhat nebulous, but as an ideal it has had wide appeal.

The typical American farm differs in several important ways from English and continental European farms. In England the typical farm is tenant operated not owner operated. These tenant farms are comparatively large. Moreover, in contrast with America, where the owner himself assisted by his family does much of the farm work, in England the farm is more often operated by hired labor. The objective of the English tenant farmer is not ownership, but rather security of tenure. The chief reason for these differences is found in the relative abundance of cheap fertile land in America especially until about 1900 and the relative scarcity of land in England together with the fact that land in England early became an attractive investment for individuals and corporations; later, when farming became less remunerative, there was a desire

on the part of the rich to own land because of the social prestige that its ownership conferred. In America land has never been an attractive investment and ownership does not carry with it any social distinction.

In continental Europe a large proportion of the farms are operated by peasants. The farms are small and operated without the aid of hired labor. In this latter respect the peasant farm of Europe is not unlike the typical American farm. Normally, however, it is much smaller and much more intensively cultivated than is the usual owner operated farm in America or the tenant farm in England. This is due largely to the relative abundance of cheap labor and the scarcity of land and partly to the laws and customs of inheritance which result in the partitioning of the land. The peasant farmer does not use modern machinery to any marked extent, although its employment has increased in recent years. Unlike the typical isolated American farm the peasant farms of Europe are usually clustered in villages, and many of the common rights of the manorial system are still in existence. It should not be understood, however, that all farms on the continent are small peasant farms. On the contrary, there are many large capitalistic farms, for in Europe as in America farming has been affected by recent developments in technical practices and improvements in farm machinery. In Soviet Russia the word farm is rapidly taking on entirely new meanings.

Neither should it be understood that tenant operated farms are an anomaly in the United States. In spite of the relative abundance of free land tenancy existed to a considerable extent even in colonial days, especially in the older settlements. Following the Revolutionary War tenancy became relatively less important. The federal government undertook the acquisition of a vast public domain which was used in the development of a class of landowning farmers. Tenancy, however, did not disappear and indeed since 1880, when the first census of tenancy was taken, has increased steadily.

The peculiar characteristics of pioneer farming, more especially the element of self-sufficiency which still exists to a certain extent, have led some to characterize farming as a mode of life. With the growing commercialization of agriculture this characterization has become, however, inadequate. Modern farming is as much a business as a mode of life. While the typical farm is still small and to a considerable extent self-sufficing, some farms today are producing

large quantities of products for sale and buying considerable quantities of seed, feed, fertilizer, machinery and other products annually. Furthermore, even if the sales and purchases are small, the organization and operation of the farm is necessarily affected by external economic forces, especially those that determine the price of the products which the farmer sells and the cost of the goods which he has to purchase. It is more appropriate therefore to consider farming in general as a quasi-business or a quasi-capitalistic enterprise. The shift from the early self-sufficing to the modern quasi-commercial type of farming led to much disequilibrium and raised many problems.

In recent years the advance made in the technique of production and the increasing adaptability of farm machinery to practically all types of farming have tended to make the size of the farm an outstanding problem. Certain agricultural economists believe that the family farm must give way to a larger unit; in other words, they believe that the size of the farm is generally too small for maximum net returns, and their efforts have been concentrated in bringing this idea to the attention of farmers. In the United States the original size of the farm was determined not alone by economic conditions, but largely by legislation. For example, the 160-acre farm common in the middle west is the outgrowth of the Homestead Act of 1862. It is now generally realized that in many areas 160 acres is not the most economical unit and that a much larger size should be the objective of most farmers. In areas where the land is level or gently rolling it is possible with the aid of modern machinery to cultivate several thousand acres profitably. Competent authorities have stated that in the corn belt, for example, the most economical unit is from 1000 to 1200 acres of land. Whether or not farms will generally become larger will depend on the executive ability of farmers and their opportunities for acquiring the necessary land and machinery. It has been estimated that such large farms will involve capital investment varying from \$50,000 to \$500,000.

Since the World War economic conditions, especially in the United States, have tended to emphasize the necessity of enlarging the size of the farm. The discrepancy between the price of farm products and the price of productive factors has emphasized the necessity of producing farm products at a much lower unit cost, and one of the methods of reducing unit cost is to

enlarge the size of the farm and engage in more extensive farming. The migration of farm population to the city has left the farmer without an adequate supply of cheap farm labor; this has tended to encourage him to use modern equipment which can be more successfully operated on large farms, and the financial difficulties which many farmers have experienced during the present depression have made the enlargement of farms more feasible and desirable. During the war and post-war periods many farmers fell heavily into debt. And when the collapse in farm prices occurred in the early part of 1920, many of these farmers found it impossible to meet their financial obligations and have since been forced to relinquish their farms to the mortgage holders, who are as a rule large mortgage or insurance companies. These companies are confronted with the problem of the disposition or use of such farms. Many farms are therefore for sale and are being purchased and combined into large operating units, while those retained by the mortgage companies are in some cases being operated in much larger units.

The corporation farm, however, is not likely to displace to any marked extent the small owner operated farm or family farm. In many sections of the United States the climatic and topographical conditions are decidedly unfavorable to the use of labor saving machinery. Not infrequently machinery cannot be used extensively because of the peculiar character of the crops grown. Often the labor available cannot without considerable training handle the type of machines best adapted to large scale farming. Finally, the small farmers can obtain through cooperative effort many of the advantages now possessed only by large corporation farms in buying and selling and in the use of machinery and equipment. For these reasons competent agricultural economists do not believe that revolutionary changes in the type of farm will soon take place in America. They are even less likely in the more stable agricultural communities of Europe. Whether or not the farm will maintain and perhaps increase its self-sufficiency as a producing and consuming unit or will be drawn ever further into the commercial system is more difficult to predict.

FARM BLOC, UNITED STATES. The Farm Bloc, insurgent and bipartisan, which arose in the Sixty-seventh Congress at the beginning of President Harding's administration, was the most significant political bloc which has yet operated in the United States.

Sporadic political agrarian movements have been numerous in American history; there had even been in the period from 1900 onward a loose and shifting grouping of congressmen interested in agrarian relief, but it was not until 1921 that a definitely organized legislative farm bloc came into existence. The movement, although aided by southern Democrats, was western in inspiration and grew out of the desire of senators and representatives from the agrarian regions to obtain remedial legislation. The economic consequences of the World War had brought about a depression in agriculture that ruined many farmers and placed many more on the verge of bankruptcy. Farm lands suddenly sank in value, the wages for farm labor rose, while the markets diminished and the prices offered for farm produce fell. Although it was pointed out in many quarters that the farmers' plight was but an aggravated aspect of a general slump, the agriculturists took the view that their situation demanded special consideration. Since improvement was looked for through the extension of cooperative marketing and of proper rural credit facilities, for which government aid in the amendment of laws and the appropriation of public funds was considered essential, the farmers looked to politics for the redress of their wrongs.

The Republican grain growers first supported Frank O. Lowden, working for his nomination

in the Republican party convention of 1920. Some of the western farmers regarded the organization of a third party as a better solution, but the vote polled by the Farmer-Labor party in the 1920 election was barely 1 percent of the total popular vote and the increase in later elections was not impressive. Expectation then centered upon the dominant Republican party: within its arena the western grain grower and allied agrarian interests would have to meet the eastern manufacturer and the business man. The recovery of power by the Republicans in 1920 meant a rivalry of urban and rural factions within the party for the adoption of policies basically opposed. Neither side was pleased with the arrangement, but in this situation the leaders of the grain growers of the northwest held the strategic position; they found allies in the agricultural leaders from the far west and the lower south. Thus a sectional alliance was created upon the basis of the common economic demand for agricultural relief. To the furtherance of this cause party ties were for the time being forgotten.

The Farm Bloc was actually formed on May 9, 1921, at a meeting of twelve senators held in the Washington offices of the American Farm Bureau Federation. In the Senate it came to be comprised of fourteen Republicans and ten Democrats. In the House the bloc organization was not so clearly defined. Although about one hundred representatives frequently acted together upon farm questions irrespective of party ties they could hardly be compared exactly with the group in the Senate. The organized legislators worked in close harmony with the organized farmers, who lent their active support and counsel through the American Farm Bureau Federation, the National Grange, the National Board of Farm Organizations and similar agencies.

It is impossible to state precisely all the bills enacted through the influence of the Farm Bloc. Senator Capper, the leader of the movement, lists those measures passed while the group was organized as follows: an amendment to the Farm Loan Act, increasing the capital by \$25,000,000; an amendment increasing the Farm Loan Bond interest rate to 5½ percent; an act to prevent gambling in grain futures; an act placing the great packing houses under the general supervisory and regulatory power of the secretary of agriculture; the prolongation of the powers of the War Finance Corporation; a measure providing for cooperative marketing facilities; and

an amendment providing for a representative of agriculture on the Federal Reserve Board.

Senator Capper stated that the bloc "undoubtedly speeded the progress toward better marketing and more justice in the distribution of the consumer's price between the producer and the distributor." The bloc at least forced the administration to consider the problems of agriculture, as in the national conference on the subject called by President Harding. Its success was achieved in the teeth of opposition from the "old guard" within the Republican party. Measures initiated by the bloc were later pointed to as achievements of the Republican party and the administration took credit to itself for them. Moreover, the business interests within the parties, unable to secure passage of their own measures, curbed the more radical tendencies of the farm group. Having secured certain palliatives, the Farm Bloc ceased to function as an organized entity. It met with reverses in both houses of Congress in 1924 and the presidential election of that year demonstrated the hopelessness of a third party. West and south failed to cooperate upon the schemes for farm relief projected in the sixty-ninth Congress. The immediate urgency of an economic crisis once passed, traditional party lines reappeared. Sectional differences among the agrarian interests again loomed large and the western farmer turned definitely to the Republican party, looking for relief through adjustment of the tariff and through schemes of price stabilization by the federal government.

The Farm Bloc served to emphasize the key position held by the western grain growers in the partisan alignment in the United States and to indicate the far reaching changes that might be brought about through an alliance of the west with the south. The bloc as a political instrumentality derived peculiar importance in this case from the fact that the economic interests represented were identified with definite sections dominated by a particular interest—agriculture. The history of the Farm Bloc indicates, however, that the bloc is not likely to emerge until the compromise of sectional demands within the political party fails and economic conditions render the need for special remedial action acute. The bloc remains under the presidential system a potential weapon useful only in extremities and then only for limited definite ends.

FARM BUREAU FEDERATION, AMERICAN. This organization is one which in several important respects is markedly different from all other general farmer organizations, for it developed directly out of the activities of the educational extension forces of the state and nation. Those who unwittingly laid the foundation of the Bureau had no thought of starting a widespread farmer movement designed to promote and foster business undertakings, to shape and guide legislation pertaining to agriculture or to pry into such subjects as the tariff and taxation. The basis of the organization consisted of the county forces, committees or bureaus back of the county agricultural agent system which had grown up so rapidly and so powerfully just before the outbreak of the World War, and which during the war years under the stimulus of emergency food needs became all but universal the country over (*see* EXTENSION WORK, AGRICULTURAL).

The county agent at first had no other purpose than to bring to the farmer the results of scientific study and by contact and demonstration to induce him to use such information in the most practical way. These agents, originally responsible to the United States Department of Agriculture and the state agricultural colleges, were in many parts of the country soon supported largely by local groups of farmers and often by local chambers of commerce. Such county bureaus or committees had even before the war begun to take an active part in the work of agricultural improvement directed by the county agent. In some states, notably West Virginia, appointment of a county agent was made contingent on the organization of such a county bureau. The acceleration of this movement gave to the farmers of the country a new and much coveted weapon—a really nation wide series of organizations which could be brought together under a new head and for new purposes. Before the end of the war the county farm bureau leaders in several states had formed more or less coherent state organizations. The first such

State Federation of County Farm Bureau Associations was organized in New York in 1917; a second appeared in West Virginia in the same year and others followed rapidly. The only manifest purpose of these state organizations was the obvious one of promoting and systematizing extension work. But since they ostensibly possessed unused powers, it was not strange that someone should suggest a national organization of these state farm bureaus, as they were beginning to be called. In 1919 the president of the New York Federation called a meeting of the state bureaus then in existence. Twelve states were represented at the meeting held in February in Ithaca, New York, at which the preliminaries of the farm bureau organization were provided for and a meeting was called to convene in Chicago in November.

The Chicago meeting was not a peaceful one, for there appeared wide differences of opinion as to the main purposes to be accomplished by the new organization. The possibilities of such a nation wide organization of farmers had in the interval been more fully realized by militant agrarian leaders. In the east especially and to some extent in the south and west a sentiment prevailed favoring a broad educational program. But the middle west stood for an aggressive business program, the backbone of which appeared to be a renewed and general advancement of cooperative marketing, coupled with a militant legislative campaign. The outcome was a compromise which could easily be interpreted as a triumph for the middle western group, since to give aggressive marketing a place on the program was tantamount to placing it ahead of any social and educational program which could possibly be formulated. Just as even the Grange subordinated its social program to economic interests during its most aggressive and spectacular period, 1872 to 1876, so for several years the Bureau put its whole energy into marketing and legislative propaganda. In more recent years its efforts have been rather more symmetrically balanced among broad interests, yet clearly its primary purpose is economic.

In the first few years of its existence the membership of the Bureau increased with remarkable rapidity. It was claimed, and on good authority, that it was over a million (1,200,000) in 1921. The official reports do not account for such a number, but there are frequent instances of delinquent payments by the county bureaus to the national organization even though the members have paid. Thus there is a bona fide

membership somewhat larger than that shown by the receipts of the national Bureau. Since a membership includes the paying members' family, the Federation has been computed to represent three and a quarter times the number of its individual members. In 1921 the budget of the national organization was over \$300,000, while that of the Illinois Farm Bureau was over \$400,000. In Illinois the dues were \$15 per member; in a few states they were \$5, but the more usual figure has been \$10. Out of these fees the national organization ordinarily received half a dollar, the state about \$3.50, the local \$6. No other farm organization, except possibly the Non-Partisan League, has ever had so much money to spend. Apparently feeling that farmer organizations in the past had made the mistake of paying officers and employees too little the Bureau has had a long list of officials receiving salaries of from \$10,000 to \$15,000 a year.

The activities of the Bureau during the first few years after its organization were directed mainly to congressional lobbying and to efforts to start big cooperatives. The lobbying was ably done, and several important bills relating to credit, marketing and other subjects were engineered through Congress. But the main effort of the Bureau went into the formulation and launching of cooperative undertakings, most important of which was the ill starred United States Grain Growers, Inc. The plan for this organization was elaborate, and much money was spent in its preparation, but it had been planned by people with too little experience in the marketing of grain and it virtually never started. The experience of the Bureau in its other all inclusive marketing ventures was not flattering, but in less spectacular ways it has been influential and effective in promoting cooperative marketing. Cooperative marketing of wool and livestock has been especially successful. The Bureau also played a real part in the organization of many dairy cooperatives and of cooperatives for the buying and selling of farm supplies.

Rather tardily the Bureau joined the ranks of the supporters of the McNary-Haugen Bill, but in general it has not been a radical body. In 1929 and 1930 it did much effective work in connection with the schedules of the Hawley-Smoot tariff act. For several years the Bureau has inspired studies of taxation in its relation to the farmers, showing most commendable leadership in this field. It has aided notably in college ex-

tension work in several states, especially in Iowa.

Some question arose in the early years of its organization regarding the relationship of the Bureau, and especially of its local units, with the state appointed county agents. A fairly clear understanding was finally reached and embodied in a memorandum signed by the head of the Farm Bureau Federation and the director of the States Relations Service of the Department of Agriculture. According to this the county agent might advise the Bureau in the development of agricultural programs, as he would advise any other farmers' organization; but as a semipublic agent he could not withhold similar service from non-members of the Bureau. Many local bureaus continued, however, to rely upon the county agents for effective leadership. Local and state farm bureaus also continued to cooperate in defraying the expenses of county agents and a distinctive feature of the Farm Bureau Federation has been its aggressive advocacy of extension work.

In 1931 the Bureau was the third farmer organization in size in the United States, having a membership of about a third of a million paying members. Its main strength is in the middle west, the leading states in membership being Iowa, Illinois, Ohio, Indiana; outside of this group it is strong in New York and California. The Bureau has worked amicably with the Grange, but in some states clashes with the Farmers' Union. In general its policy has been aggressive but cautious, and it clearly has stood midway between radicalism and conservatism.

FARM LOAN SYSTEM, FEDERAL

LONG TERM CREDIT. The struggle of the farmer for cheaper money and easier credit has colored American agrarian history since the Civil War. The Greenback and free silver movements and the pressure for the liberalization of national bank legislation are indicative of the

Farm Bureau Federation — Farm Loan System, Federal 107

credit roots of agrarian unrest in the last quarter of the nineteenth century. By the close of the century the change in the character of agriculture, which was losing the features of a self-sufficient way of life and becoming an industry organized along business lines, gave particular force to farmers' complaints of the inadequacy of the existing mortgage credit facilities. The passing of the frontier with its plentiful supply of rich, unoccupied land, together with the increasing mechanization of agriculture, made the farmers increasingly feel their dependence upon financial institutions for the funds necessary to carry on their operations. Land values began a steady and consistent rise and farmers were compelled to borrow more money to get possession of land. In addition farmers frequently needed to borrow rather substantial sums of money to finance improvements on their farms or the purchase of machinery and livestock. The mortgage credit system comprising life insurance companies, private mortgage banks and in part commercial banks was found wanting on several counts. It was claimed that the customary term of farm loans was too short to allow for repayment out of the surplus yield of the land; that the method of repayment was haphazard; that the possibilities and conditions of renewal were uncertain; and that interest charges and commissions were higher than a good farm mortgage security under a specialized and mobile system of land credit should warrant.

The agitation for additional mortgage credit facilities attained national prominence during Taft's administration, but the Federal Farm Loan Act was not passed until 1916. In its final form the act represented a compromise between the cooperative and individualistic points of view. A group in Congress, influenced by a commission which it had sent to Europe to study the mortgage credit institutions there, favored non-profit, cooperative land mortgage banks patterned after European models, organized, owned and controlled by farmer borrowers. Another group, influenced by the private farm mortgage banks already in existence, insisted that the cooperative method was not suited to American conditions and proposed the establishment of additional private mortgage credit institutions operated on a profit basis under government supervision. The act provided for Federal Farm Land Banks as the regional institutions of a non-profit cooperative mortgage credit system; but in order to meet the opposition of the existing farm mortgage banks the act made it possible for

the latter to reincorporate into the new joint stock land banks, which could avail themselves of some important privileges under the new law while continuing to operate for private gain.

The administrative framework of the Federal Farm Loan system resembles somewhat the Federal Reserve system. At its head is the Federal Farm Loan Board, composed of the secretary of the Treasury, chairman ex officio, and six other members appointed by the president, one of whom is designated farm loan commissioner. The Board supervises the operations of the Federal Land Banks, the joint stock land banks and the National Farm Loan associations. It issues from time to time general rules and regulations governing their operation; through the examiners and appraisers of the Farm Loan Bureau it subjects the banks and associations to periodic examinations and passes upon the value of mortgages tendered as security for bond issues.

Under the act twelve Federal Land Banks were established in 1917, and in 1922 the Baltimore bank opened a branch in Porto Rico. The banks are limited in their lending operations to single districts, the boundaries of which were drawn in such a way as to equalize the credit demands made upon the banks and to provide for a diversity of agricultural conditions within each district. The original capital of the banks—\$9,000,000 in all—was supplied almost entirely by the government, but provision was made for redemption of government stock by the National Farm Loan associations as soon as the operations of the banks attained sufficient magnitude. The original directors of the banks were appointed by the government, but it was hoped that with the transfer of the stock to member associations a majority of the directors would be elected by them. Before that step was taken, however, the law was amended, and at present each bank is managed by a board of seven directors, three elected by the borrowers through their associations, three appointed by the Federal Farm Loan Board and one appointed by the Board from a list of nominees selected by the borrowers through their associations. The control of the Federal Land Banks is thereby virtually placed in the hands of the Federal Board at Washington, although the government retains only a small amount of stock in two banks.

The banks obtain the funds which they loan to the farmers by issuing and selling bonds, secured by the borrowers' mortgages, which are trustee with the district Farm Loan registrar

appointed by the Farm Loan Board. The bonds are nominally issued as the obligation of a particular bank but are in effect the joint obligation of all the twelve banks. In marketing a part of these bonds the banks relied in the early years on the assistance of a syndicate of investment bankers and the support of the federal Treasury, which was authorized to purchase bonds not in excess of \$100,000,000 per annum. Since then, however, the bonds, which are tax exempt securities and are issued in small denominations, have attained a good reputation and are marketed directly by each bank locally and by a joint organization of the banks which maintains a fiscal agent in New York City. At present these bonds are widely held, many of them abroad.

At the base of the Farm Loan system are the National Farm Loan associations, cooperative organizations formed by farmers for the specific purpose of securing mortgage loans through the Federal Land Banks. The banks with the exception of the Porto Rico branch and a few isolated cases in the continental United States make all their loans through these associations. It takes a minimum of ten farmers to form an association, and these ten farmers must make application for a minimum amount of \$20,000 in loans. Upon its organization the association is assigned a definite territory, the farm population of which must apply for loans through the intermediation of this association. Its loan committee passes upon applications for loans, appraises the value of the underlying property and may reject the request or reduce the amount of the loan. In either case the decision of the association is final. If it approves the application, this is sent on to the bank, which in its turn sends an appraiser to inspect the property on which the loan is desired. Upon approval of the loan by the bank the association subscribes for bank stock to the amount of 5 percent of the loan and the borrower in his turn subscribes for an equal amount to the association stock. It also endorses the borrower's mortgage to the bank, but since the stock of the association carries only double liability the farmer members of the association are not jointly liable for one another's loans. The association employs a paid secretary-treasurer and is supposed to assist the bank in seeing that the borrowers make prompt payments of maturing instalments of the loans, of taxes and of insurance premiums on the mortgaged property. It was hoped that the associations would develop into live cooperative institutions which would formulate policy for the banks and exercise a

watchful control over them. These hopes were not borne out by subsequent developments. The associations at present vary in size from the legal minimum of ten members and \$20,000 in loans to a maximum of several million dollars in loans and a membership exceeding 1000. At the close of 1930 there were 4656 associations in existence.

The joint stock land banks have no organic relation to the other institutions in the Farm Loan system, but they must be chartered and are subject to supervision by the Board in Washington. They are private mortgage institutions and make loans directly to farmers. They secure their funds by issuing tax free mortgage bonds under the supervision of the Federal Farm Loan Board. These bonds are individual obligations of the issuing bank and no one joint stock land bank is in any way responsible for any of the obligations of another bank. The number of joint stock land banks grew rapidly from 1919 to 1923, but since then it has been declining continually because of liquidation and consolidation. These banks are assigned a definite territory upon their organization; at present there are more than ten states in the Union not served by such banks.

The regulations regarding the purposes, duration and interest charges on the loans as well as the value of underlying mortgages apply equally to Federal Land Banks and to joint stock land banks. Loans granted by these institutions must be used to liquidate existing mortgage indebtedness on farm land, to provide for the purchase of land for agricultural purposes or of equipment, fertilizers and livestock necessary for the proper and reasonable operation of the mortgaged farm and to finance buildings and improvements on the farm. Of the loans the mortgages of which were submitted to the Board for approval as collateral for bond issues from the inception of the system to the end of 1930, 77 percent were used for refunding existing mortgage indebtedness, 7 percent to repay loans not secured by farm mortgages and 11 percent for the purchase of land.

Loans must always be secured by first mortgages on improved farm real estate and cannot exceed 50 percent of the value of the land appraised for agricultural purposes and 20 percent of the value of the buildings thereon. Individual loans of the Federal Land Banks may run to a maximum of \$25,000, but the joint stock banks can make loans up to \$50,000. The banks are permitted to charge the borrowers a rate of interest 1 percent in excess of the rate on their bonds, but under no conditions may they charge

more than 6 percent. The greater part of the loans has been made at 5-1/2 percent interest. The duration of the loans may not be less than five years nor more than forty years, but the typical maturity of a loan granted by the system is about thirty-five years. Loans must be amortized in semi-annual instalments, and the borrowers are given the privilege of advance repayment.

The loaning operations of the Federal Land Banks expanded rapidly in the first three years of their existence and came to an almost complete stop for about a year in 1920-21 when the constitutionality of the Farm Loan Act was tested. The next five years saw the most rapid growth of the banks; this is particularly true of the period from 1922 to 1924, when the increase in loans was in part due to the pressure by commercial banks for liquidation of farmers' indebtedness to them. Since the beginning of 1928 the volume of new loans made constantly declined, and since about the middle of 1929 new loans granted have not been as great as reductions in the old loans outstanding. The joint stock land banks were developing rather slowly in the early years of the system's existence, but from 1922 to 1926 the rate of their expansion at times exceeded that of the Federal Land Banks. The average size of their loans as compared with that of the Federal Bank loans indicates that they have been serving a somewhat more prosperous farming clientele. Since 1927 new loans granted by joint stock banks have seriously declined.

The system as a whole passed through a crisis in 1927: some of the banks were guilty of lax practises and low standards, and in a few cases abuses and mismanagement actually led to criminal prosecution. As a result the Farm Loan Bureau at Washington was reorganized and closer supervision and more regular examination of the banks and associations have been instituted. It was estimated that at the close of 1924 the Farm Loan system supplied 14.6 percent of the total farm mortgage credit in the United States; at the end of 1927 the share of the system amounted to 19.3 percent.

The underlying cause of the 1927 crisis was the increasing gravity of the foreclosure problem. Foreclosures first attained some importance in 1925, when the Spokane Federal Land Bank found itself unable to charge off all defaulted loans against reserves. The other Federal Land Banks agreed then to take over a part of the foreclosed real estate and to charge off the corresponding loans against their reserves. Since then the amount of foreclosures has become too large and the policy of not showing foreclosed real estate as an asset in the statement of conditions has been given up. At the close of 1930 the Federal Land Banks owned real estate valued at less than \$21,000,000, against which they had set up reserves of over \$8,000,000. The foreclosure problem has been more serious for the joint stock land banks. Three of them have been forced into receiverships. In the case of a good many other joint stock banks the public

faith has been so shaken that they are no longer able to sell their bonds and make new loans. Several of them are really in process of voluntary liquidation, their outstanding bonds selling at a discount of from 40 to 50 percent of their face value.

The seriousness of the foreclosure problem indicates the abnormality of general agricultural conditions under which the system has been operating. Agriculture has passed through an enormous land boom, which has been followed by one of the most severe agricultural depressions in history. Whatever the system may have accomplished under more normal circumstances, its actual achievements are not particularly important. It is true that interest rates have been reduced and dependable long term credit is made available to those who have good security to offer. But contrary to the claims made for the system before its establishment it has not reduced farm tenancy, which is probably larger today than ever before. No back-to-the-land movement was initiated, but rather the movement away from the farms has continued unabated during the past ten years. Finally, foreclosures are increasing yearly in volume and number, and the general economic condition of the farmers is growing worse rather than better.

INTERMEDIATE CREDIT. The sudden and drastic decline of agricultural prices in the United States in 1920-21 led the country bankers to demand the repayment of a considerable portion of the large volume of bank indebtedness contracted by farmers during the World War and the land boom which followed immediately after. As a result there developed a grave credit stringency in the principal agricultural states. This led to the demand for the establishment of credit facilities that would bridge the gap between the Farm Loan system providing long term credit and the commercial banks, which could safely extend only short term loans. It was felt that some agricultural loans could not be self-liquidating unless their maturities ran from nine months to three years. To meet this need the Sixty-seventh Congress passed on the last day of its session an amendment to the Federal Farm Loan Act entitled the Agricultural Credits Act of 1923, which provided for the establishment of twelve Federal Intermediate Credit Banks. Although they were set up as adjuncts to the Federal Land Banks and were made subject to supervision by the Farm Loan Board, they constitute in effect a separate credit system and they have no organic connection or financial re-

lations with the other banks of the Farm Loan system.

The Intermediate Credit Banks are owned by the federal government; their entire capital stock was subscribed by the federal Treasury. Each bank is capitalized at \$5,000,000, but by the end of 1930 only \$30,000,000 of the subscribed amount had been called by the banks. In return 50 percent of the net earnings of the banks are paid into the Treasury as a franchise tax. The funds necessary to carry on loaning operations are obtained through the issue of short term tax free debenture bonds secured by farm paper in the banks' portfolios. The maturities of the debentures may not exceed five years, but ordinarily they run from three months to a year. They constitute a joint obligation of the twelve banks, are issued under the supervision of the Board in Washington and are marketed by the same organization which handles the bonds of the Federal Land Banks. As they are very well suited to the investment requirements of the large commercial banks they are always readily marketable. The Intermediate Credit Banks are also privileged to rediscount their paper with the Federal Reserve Banks but have never taken advantage of this opportunity.

Intermediate Credit Banks do not deal directly with farmers. They make loans to cooperative marketing associations on warehouse and shipping receipts covering stable agricultural commodities. The types of commodities on which loans may be made by the banks are subject to regulation by the Farm Loan Board, but no loan may exceed 75 percent of the market value of the commodity offered as security. Cotton and tobacco have absorbed a considerable proportion of the loans made by the banks since their establishment. The paper of individual farmers comes to the banks through a local credit agency such as a commercial or savings bank, a trust company, a livestock loan company or an agricultural credit corporation. Agencies discounting with the Intermediate Credit Banks may not make a charge for their loans in excess of 2 percent (in the case of livestock loan companies 2-1/2 percent) of the interest paid to the banks on the rediscounted paper. This accounts in part for the fact that commercial and savings banks and trust companies scarcely avail themselves of the facilities offered by the Intermediate Credit Banks. Through the agricultural credit corporations, many of which are organized by the cooperative marketing associations, the Intermediate Credit Banks are able to make

agricultural production loans secured by liens on crops, work stock and farm equipment. The maturities of loans and discounts by Intermediate Credit Banks may not be longer than three years; the original limitation of minimum maturity to nine months was abolished in June, 1930. The interest charged may not exceed 1 percent of the interest paid on the debentures.

TABLE II

Source: Compiled from the *Annual Reports* of the Federal Farm Loan Board.

The Intermediate Credit Banks have rendered a very real service to the cooperative marketing associations of the country and have also given considerable aid to the livestock industry and to those agricultural sections where other banks were not adequate to take care of local credit needs. They have been most helpful in the south, west and in the spring wheat belt. It was estimated that in 1929 their discounts amounted to 2 percent of the total personal and collateral loans obtained by farmers. They have also been used to some extent as distributing agencies for credit assistance in flood and storm stricken areas. Should the Federal Farm Board succeed in its endeavor to get a large volume of agricultural products marketed through cooperative associations, the business of the Intermediate Credit Banks would no doubt increase, as these institutions are ideally adapted to financing cooperative marketing activities. At the present time, however, they are not doing a large volume of business, and there is little likelihood of their doing much more in the immediate future unless the cooperative movement in agriculture should attain greater proportions.

FARM MANAGEMENT as an economic function consists of the organization and operation of individual farms; as a discipline it consists of the development of scientific methods and techniques for the direction of such organization and operation. In virtually all societies the practise of farm management has been a matter of private economy as contrasted with public or political economy, and its motive maximum gain or maximum utilization of the productive resources and economic opportunities at the command of the individual farm proprietor.

The term management as used in agriculture has come to carry a broader meaning than is ordinarily given it in non-agricultural industry, where it generally applies only to operation and to some limited phases of the organization of a business, excluding the broad executive and financial responsibility comprehended under the term entrepreneurship. In agriculture, however, it has come to be applied to the whole range of responsibilities of both organization and operation: planning the financial structure of the business, making commercial contacts for both buying and selling, determining the production program and determining which and in what proportions productive factors are to be combined as well as current control and direction of farm labor and of technical operations, the administration of marketing processes and the keeping of records and accounts.

Since farm management in this sense is an essential function in farming it is as old as agriculture itself. In pastoral and feudal regimes and in general when farming was preeminently self-sufficing rather than commercial and when traditional methods were dominant, management had limited scope and opportunity. With the development of modern industry and of inter-regional and international trade agriculture has been brought into the commercial system, until a knowledge of business methods as well as of improved agricultural techniques has become a condition of profitable farming, and farm management an increasingly complicated art.

The hired farm manager or estate manager has been of some importance in the history of agriculture. He has appeared in every society characterized by large landed estates and absentee ownership—in Egypt, in the later Roman Empire, throughout mediaeval and modern Europe. Such hired managers have at times contributed to the science of farm management; more often, however, such management has been inefficient and unprogressive.

In the United States, where the family sized holding is the prevailing type, the number of farms operated by hired managers has always been comparatively small. In recent years, however, there has been a conspicuous development of a new type of farm management service. Companies have been formed for the purpose of planning and operating farms for owners who do not care to put them into the hands of tenants and who are not in a position to organize and operate them themselves. In the last decade such management companies have gained temporary importance in the disposition of farms acquired by banks or insurance companies as the result of mortgage foreclosures.

More important has been the development, particularly in European countries but also in the United States, of organizations rendering a limited amount of managerial service such as the keeping of records and accounts and the analyzing of such data for the guidance of farm proprietors. This service is in many countries a part of the government program of agricultural extension work; in Europe it has been largely fostered also by the agricultural societies. Such programs represent practical applications of a growing science and discipline of farm management.

The evolution of the function of farm management has resulted in the growth of systematic, analytic study of its underlying principles. Ar-

thur Young in England and Albrecht Thaer in Germany in the early nineteenth century were pioneer writers on the function of farm proprietorship: Arthur Young as preeminently the apostle of the new agricultural technique, Thaer as the formulator of principles and the founder of the science. Further development of the principles of farm management did not take place for several decades. After the Napoleonic wars English agriculturists were interested chiefly in the tariff controversy and, following the repeal of the corn laws, almost entirely in land tenure. In Germany, on the other hand, the attention of agriculturists turned to the application of natural science to agricultural technique. But the rapid opening of new and highly productive agricultural lands in America and other parts of the world in the latter half of the nineteenth century with the consequent flooding of European markets and depression of agriculture again directed general attention to the economic problems of the farmer. A group of German scholars, of which von der Goltz, Kraemer and Pohl were the most conspicuous, revived interest in the work of Thaer and carried forward the development of farm management principles and the application of farm accounting to the organization and operation of farms.

In the theoretical sphere problems of farm management merge into those of the broader study of agricultural economics (*q.v.*) and the development of the two has proceeded in a parallel course, often through the efforts of the same individuals. Thus Laur in Switzerland and Aeroboe in Germany, leaders in European farm management, are also outstanding agricultural economists. These two are at considerable variance in their conception of the farm management problem, particularly the theory and practice of farm business analysis. Aeroboe, who has held teaching and research positions in various German universities and has had successful experience in practical estate management, has for many years conducted a farm accounting service for the proprietors of German estates. His point of view in farm management is that of the large scale operator. On the other hand Laur, for many years professor of rural economics at the Zurich Polytechnic, who as secretary of the Union Suisse des Paysans has supervised an account keeping service for Swiss peasant farmers and conducted researches in farm accounting and farm management, takes the problems of the small farmer as his basis for analysis of farm management problems. On the technical side

Laur is an ardent supporter of detailed and independent cost accounting analysis of the various separate enterprises making up the farm business as the foundation for business analysis and production guidance, whereas Aeroboe conceives of the farm as a closely knit organism and regards the effort at financial analysis of the production of an individual crop or class of livestock as artificial and misleading. A similar variance in point of view is reflected by different groups of farm management specialists in Great Britain and the United States.

Farm management research and instruction in Europe have greatly developed during the last two decades. Germany has led the way not only in the study of farm management but in research into such special aspects as farm labor efficiency. In Great Britain a number of research establishments have been set up, the most notable of which is the Agricultural Economics Research Institute organized in 1913 at Oxford University. The prevailing type of investigation in these institutions is the study of production costs, although many projects of broader scope are being prosecuted. Other western European countries including Denmark, Sweden and Norway are developing substantial programs of farm management research. In at least half a dozen European countries something approaching Laur's system of record keeping is in operation, either officially as a part of government service or privately on a commercial basis.

Especially interesting are the recent developments in Soviet Russia. In the earlier years farm management research centered about the problem of the organization of peasant farms. Chayanov's (Tschajanow) work, *Die Lehre von der bäuerlichen Wirtschaft* (Berlin 1923, tr. from Russian by F. Schlömer), is probably the outstanding Russian contribution in this field. From some points of view the most significant recent development in farm management has been the assumption of that function by the state as exemplified in Soviet Russia. The government has not only itself undertaken the organization and operation of vast tracts of land for the production of grains and livestock, but is taking an active part in the reorganization of peasant farming through its program of collectivization. Russian farm management investigators are vigorously at work on the new problems raised by state farming and collectivized agriculture.

In the United States the scientific attack on farm management problems through research and instruction is of much more recent origin

than in Europe. In 1902 the Minnesota Agricultural Experiment Station in cooperation with the federal Department of Agriculture began a series of studies in the cost of production of farm products which has extended with minor interruptions to the present time, mostly under the direction of Andrew Boss. These studies have been based on more or less elaborate records of actual costs compiled by farmers with the aid of specialists. A little later the New York Agricultural Experiment Station under the leadership of G. F. Warren began the study of farm management through the survey method, which involved securing the farmers' estimates of income and expenses through personal interviews conducted by students or special agents. This method, which was adapted to the covering of a wide area by relatively few enumerators, was taken up by the United States Department of Agriculture upon the establishment of the Office of Farm Management in 1905 under the direction of W. J. Spillman and was carried on in various parts of the country. A new contact with general economic theory was given to farm management research by the work of H. C. Taylor, first at the University of Wisconsin and from 1919 to 1921 as chief of the federal Office of Farm Management. While this new influence raised a controversy which is still existent as to the relative validity of the cost accounting approach to farm management problems and the more generalized approach from the point of view of the business as a whole, the result has undoubtedly been a broadening of the program of farm management research.

By 1914 some form of research into the problems of farm management had been inaugurated in about 25 percent of the agricultural experiment stations of the United States. This research consisted largely in attempts to devise methods of cost analysis and some studies of the best combinations of products and of technical methods. The application of the results of this study was accomplished largely through the extension workers of the colleges and of the Department of Agriculture. The whole movement received a great impetus in the post-war period. The creation of a national extension service had provided the basis for an enlarged program; the discussion of price fixing during the war led to a new interest in cost accounting methods for farmers; while the agricultural depression made evident the need for increasing control of the economic aspects of farm life.

A survey of research in agricultural economics

made by the Social Science Research Council in 1927 revealed that in that year there were 125 farm management projects being conducted by state experiment stations and the federal Bureau of Agricultural Economics. A broad range of problems was covered in this research. It included cost of production studies, general studies in the organization and reorganization of farms, studies in farm practise, studies in the methods of farm business analysis and a rapidly growing program of type-of-farming studies in which the regional and local variations in farm economy are related to the numerous combinations of physical conditions and economic forces which shape and reshape agriculture. Research into the personal characteristics making for success or failure in the function of farm proprietorship has been begun. The problem of making the results of such studies serviceable to the individual farmer remains a serious one. Some students of the problem feel that all that can be done is to acquaint the farmer with methods of cost analysis and to allow him to make his own decisions as to changes in production policies; others advocate the elaboration of local programs of agricultural improvement by special farm management leaders and the presentation of such plans to all the farmers of a region.

One of the most significant developments of farm management research in the post-war period has been a concerted effort toward refinement of method, particularly in terms of quantitative analysis. There has also been a clarification of the objectives of such research. The outstanding objectives are now recognized as, first, the gaining of a clear and more adequate understanding of the problem which the individual farmer faces in attempting to make the most of his resources; second, aid in the broader problem of agricultural readjustment; and, third, the furnishing of adequate subject matter for instruction in secondary schools, in colleges and through a rapidly expanding extension service in the principles of farm organization and management.

FARM RELIEF. Farm relief measures can be defined as governmental arrangements, temporary or permanent in character, which are designed to alleviate economic distress of established farmers. Since the World War the series of depressions in prices of farm products has manifested marked severity and has been almost world wide. In the United States the condition of agriculture is reflected by the fact that the farmer's buying power was 19 percent less in 1925-26 than in 1919-20, while the buying power of others was increased, in some cases markedly. The recession in business activity during 1929-30 had as one of its first and most pronounced effects an increase in the disparity between the prices paid for farm products and the retail prices paid by farmers, the buying power of the farmers falling below the 1910-14 average by 30 percent. The disequilibrium between agriculture and industry has persisted both in the United States and elsewhere. In fact, in 1929 and after, some countries with important industrial populations, such as Germany, France and Italy, have used national policies more effectively than other countries to prevent low domestic prices in the case of staples such as wheat and rye.

Farm relief schemes existed in Europe during

the nineteenth century and earlier; in the eighteenth century the Prussian grain reserve organization did much to maintain prices, while reforms in land tenure in France and changes in protectionist policies to aid agriculture in various countries were effected throughout the nineteenth century. In general two methods were followed: attempts to change the direction of production toward products whose prices were less depressed were made in England, Holland and Switzerland, and manipulations of customs duties were prominent in France and Germany.

Post-war systems of relief have emphasized central agencies for stabilization of prices and control of the customs duties. Important European patterns of farm relief used since 1920 include two that are new or given new force in application. Germany, Sweden, Czechoslovakia, Latvia, France and Estonia have imposed requirements that home grown wheat and rye be used by millers in proportions ranging from 30 to 95 percent. Sweden, Latvia, Switzerland, Portugal and Spain have developed grain monopolies different from tobacco and other fiscal monopolies in that there is no expectation that the public treasuries will have increased net receipts.

An older European pattern has been used in behalf of some of the farm products of Austria, Czechoslovakia, Germany, Hungary, Latvia, Poland and Sweden. These have been given an export impetus by the use of export-import certificates, the legal principle of which, particularly in its most liberalized pre-war application in the German *Einfuhrscheine*, which were introduced in 1879, was used in formulating the original plan for export debentures in the United States. Agricultural products sent out with certificate benefit were replaceable by dutiable imports with duties canceled. Assignability of certificates made them resemble cash bounties to exporters with corresponding effects in increasing prices above world parity. These certificates, used in the several countries without provoking foreign reactions which have sufficiently specific reference to the export premium rates in question to be designated as either anti-dumping or directly retaliatory, have tended to alleviate the rigors of the protectionist regime in the case of the particular products. The general tendency in Europe is to abandon export duties and to increase import tariffs in an effort to protect farm products.

The American farmers' recent difficulties have arisen chiefly out of a lack of balance between

production and demand. On the one hand, stimulation of supply has resulted from favorable prices during the war, governmental encouragement, widespread farm mechanization and liquidation of certain classes of livestock, such as beef cattle. Adjustments to low prices of farm products have tended to include reduced production only as a last resort. On the other hand, domestic demand has been lessened by decline in the consumption of feed crops as a result of decrease in the number of horses and mules and the reduced use of corn as food, and by decline in per capita food and beverage consumption of cereals and in use of some other farm products, notably animal fats. Foreign demand has been altered because foreign low cost producers have been expanding output and because reduced purchasing power in Europe since the World War has cut off markets for farm products.

In the more comprehensive explanations of the economic disparities evident in American agriculture since 1920 various factors have been prominent, although there is little agreement as to the weight to be given them. High tariffs abroad and at home have united to reduce the exchange power of American farm exportables. Agricultural protective duties in the tariff act of 1930 designed to expand home production of farm products now imported have not been successful in diversifying the agricultural uses of land sufficiently to afford general price relief. It has been claimed that the result of the immigration policy of the United States is to keep high the wage costs to farmers and wage costs of domestic services and products which they buy. Effects of decreased immigration in maintaining per capita purchasing power in American cities have been emphasized as immediately helpful to non-export branches of agriculture, but it is possible that the higher wages resulting have been expended chiefly on non-agricultural products.

The post-war credit reversal by which goods exported from the United States are no longer needed to pay interest or instalments on large amounts of European capital has caused the large intergovernmental and other intercontinental debts to take a prominent place in the problems of American agricultural exports. On this side reduced willingness to receive foreign products, as evidenced by the increased rates in the tariff acts of 1922 and 1930 and refusal to cancel intergovernmental debts, has tended to make agricultural self-sufficiency a primary objective in net debtor countries, or at least to

give them added reasons for economic rapprochement with agricultural exporting countries more willing to accept their industrial goods in exchange.

Reclamation projects promoted under governmental stimulus as well as through the activity of private land development companies have led to a wide extension of farming on formerly unused land quite without respect to the protection of established agriculture either in the United States or in other countries. In some countries laws have been passed for redistributing land to users committed to more intensive cultivation. Taxes paid by farmers have increased two and one half times since 1914, while land prices and values of farm products have lagged behind, with the result that farmers pay a larger percentage of their income in taxation than all other groups. The majority of farmers in nearly every state have remained outside of any national general service farm organization, and likewise many farmers have kept aloof from cooperative commodity organizations. In the case of products entering international markets no more than the faintest beginnings of international action by farm organizations have been in evidence.

The seriousness of the situation from the standpoint of the nation as a whole has lain in the deterioration of the farm real estate in many cases, in the encouragement of considerable unprofitable shifting of farming personnel, plans and procedure, the passing of farm real estate titles to hands whose strength lies in non-agricultural sources of income, and the resultant reduction of the standard of living of a large part of the population.

In the United States Congress the bills brought to vote emphasized three main types of remedies. Import duties in the Fordney emergency tariff act of 1921, the Fordney-McCumber act of 1922 and the Hawley-Smoot act of 1930 were directed toward the protection of farm products. In 1921 the War Finance Corporation was reorganized for the purpose of assisting in the financing of the exportation of agricultural and other products; in 1923 the Federal Intermediate Credit Act was passed, and in 1929 the campaign for credit was given further expression in those features of the Agricultural Marketing Act emphasizing loans to agricultural cooperative associations. The third group of measures was designed to increase the power of exportable farm products to command dutiable imports and other items in exchange; emphasis

was placed successively on equalization scrip, equalization fees and export debentures. In the provisions of the Agricultural Marketing Act, however, the most drastic step taken was to authorize the organization of stabilization corporations for holding products during emergencies.

The Federal Farm Board was established July 15, 1929. During the first two years of its existence its emphasis, apart from price stabilization activities in wheat and cotton, was upon building up national sales agencies and regional associations to provide interconnections between the new agencies and existing or new local cooperative associations. National sales agencies established during this period include the Farmers' National Grain Corporation, Chicago; the National Wool Marketing Corporation, Boston; the American Cotton Cooperative Association, New Orleans; the National Livestock Marketing Association, Chicago; the National Pecan Marketing Association, Jackson, Mississippi; the National Bean Marketing Association, Denver; and the National Beet Growers' Association, Greeley, Colorado. The end of the second year of Board operation found these agencies functioning with various degrees of vigor, but without exception they were still far short of full commodity control. During these first two years prices of most farm products continually slumped to lower levels. While the holding of surpluses in a year of marked rise in prices might bring price benefits sufficient to pay carrying charges, in prolonged periods of falling prices such holding brings inevitable losses to the accumulating agency and is not likely to promote price recovery.

The principal problems in the stabilization process have arisen from the difficulty of creating scarcity and the tendency to aid prices in other countries where foreign competitors without joining in the costs of applying the method have benefited at the same time that an overabundant supply is heaped up in the United States. Under the stabilization operations the tendency was to shut off exportation of milled products more sharply and promptly than that of related raw materials. For a stabilizing country to reduce its share of the milling by-products, preferably kept cheap for the sake of its livestock and dairy industries, could have both agricultural and industrial disadvantages. Any marked tendency to confine foreign sales to the more highly competitive unmilled grain rather than flour has the seeds of handicap for the

stabilization corporation when it proceeds to reduce its holdings.

The methods of stabilization corporations stand in contrast with those implicit in scrip, fee and debenture plans, designed to offset export handling charges on both the processed and unprocessed products and to seek national prices above world parity through adjusted national scarcity. The equalization fee, a fundamental feature of the more far reaching McNary-Haugen bills, would provide that surpluses above domestic consumption be exported at world prices, any losses engendered by the difference between world and domestic price being recouped by a differential loan assessment, or equalization fee, on each pound or bushel sold domestically. The domestic price would thus be influenced by the import duty and the amount of the equalization fee. Under some plans the assessment would be made by paying the producers in the form of scrip, whose redeemable value would be determined after operating costs and losses had been calculated. The debenture plan would provide customs credits having the same economic effect as a cash bounty on exports of agricultural products, the debentures being used by importers in the payment of customs duties. Domestic prices would thus be raised but little less than by a cash bounty. The domestic allotment plan provides for world parity prices to producers for their exports and for this price plus a considerable portion of the tariff duty for goods marketed domestically. Allotments as to the amount sold in the home market would be made to producers. These three plans all aim to "take advantage of the tariff" on farm products, but they differ among themselves in that the equalization fee, scrip and cognate domestic allotment plans would finance reimbursements for foreign sale losses through compulsory levies on the marketed units of product selected for benefit, while export debentures would cause the difference to be made up through increased dependence upon general taxation. Questions of constitutionality apply with special force to all proposals involving compulsory levies. The desirability of adding a sales tax upon any of the units of a product for which net price enhancement is sought can be questioned also in terms of the limits to which regressive burdens should be placed upon producers and consumers. Questions of using general taxes to support export premiums arise less as legal than as economic problems in the case of export debentures.

Recognition of need for concerted interna-

tional action has been most in evidence in the case of rubber, sugar, wheat and other products, although the International Wheat Conference of March-April, 1931, failed to recommend any quota plan for production or exports. No other plans have reached the point of development of either the Stevenson rubber or the Chadbourne sugar plans. International agricultural conferences confined mainly to European countries have given some impetus toward special trading agreements between exporting and nearby importing countries. The individualism of nations in their attitude toward agricultural products having international markets seems to make adequate collective action remote. Without such action, however, expansion of production and exports may proceed apace in Russia and other countries and even be aided by restrictions applicable elsewhere. This applies not only to restrictions as to plantings and breedings, to exports of products in raw, semimanufactured or final form, but also to restriction designed to turn a part of the production toward use as animal feeds in the case of bread grains or otherwise to affect class price advantages for portions of certain crops. Effort along these lines in one country without corresponding procedure in others is as likely as not to be futile or even worse.

Even where equalized participation of the various countries could be assumed, it appears that immediate relief in the case of one type of commodity is likely to be based at least in part upon making more abundant the competitive supplies of farm products available for some other use. Most farm relief efforts if required to be maintained over long periods may cease to have more than a redistributing effect as between different commodities and different countries. In the process of shifting, however, agriculture in a weak country or in a strong country lacking a disposition to protect it from external or internal disadvantages may participate in the national dividend less fully than in other countries more able and disposed to take vigorous steps in its behalf.

FARM TENANCY

GENERAL AND HISTORICAL. Farm tenancy is one form of division of function in agriculture. As such it has existed in some form in most developed agricultural systems. It is often difficult to distinguish actual cash tenancy from mere contracts for labor, under which the remuneration of the worker is supplied partly in land for his cultivation, or from métayage, or share tenancy, under which the tenant pays as rent a fixed or varying share of the crop. The difficulty is greatest when one is dealing with historical phenomena, but even under contemporary conditions one class shades off into another and they are finally distinguishable only on legal principles. Tenancy in its more advanced forms is created by a lease which differs from the mere contract under which the cropper, the share ten-

ant and the métayer work and hold land in that during its term it confers a limited title in the land itself and in the higher forms confers exclusive possession for the time being. Tenancy is also distinguishable from "cropper" systems or other labor contracts by the degree of interest of the tenant in the land and by the degree of interest of the owner in the labor of the worker or occupier. The owner has little control over the labor of a cash tenant, whereas he often supervises quite closely and to some extent controls the cropper and even exercises general direction over the operations of the métayer.

Farm tenancy may arise and has arisen from many economic and social causes, the chief of which perhaps are these: the inability of the owner to make economic use of land; the unwillingness of the laborer to work for wages; the inability of the cultivator to provide capital for both cultivation and ownership; and generally the economy of division of function in the supply of capital and direct management or labor between owner and cultivator. While there have been cases in which the previous appropriation of land excluded cultivators from the privileges of ownership and led to their exploitation, the continuance of tenancy systems cannot be attributed merely to such conditions. From Roman days to contemporary times some tenants at least have been comparatively rich cultivators.

In the early history of agricultural organization it is often difficult to distinguish between tenure which is effective possession and tenancy which is merely beneficial occupation. Systems of communal or group occupation and cultivation preceded individual ownership of land in most parts of the world. In England and in parts of northern Europe, for instance, group occupation and use continued for several centuries after the beginning of the Christian era. In various ways forms of communal occupation and use developed into individual occupation with or without actual possession or into effective possession with or without occupation and use or into the condition of use without possession which is tenancy. In Rome apparently changes from communal cultivation came through the granting of parcels of land to dependents (*clientes*) of the clan as tenants at will (*precario*) on condition of their paying to the group a share of their crops. At a later date grants of land in the form of tenancy were made by the state to cultivators. In England grants of land were early made to the church and to persons who could not themselves conduct cultivation and who

therefore let it out to tenants. In some cases tenancy resulted from the establishment of differences in economic and social status through conquest. The Athenians, for instance, often let conquered land which had been allotted to them by the state to the former owners or cultivators as tenants. In other cases, as in the Roman Empire and again in the United States of America, the development of forms of tenancy was due to the economic and social breakdown of systems of slavery. In economic systems characterized by the prevalence of small individual proprietorship changes in the relative positions of debtors and creditors have led to systems of tenancy. In many parts of the world tenancy developed as an outgrowth of feudal systems. This was to some extent the case in Japan. In India it developed more directly from the necessities of obtaining state revenue and from conditions of creditor and debtor. But in northern Europe all existing systems of tenancy developed through feudalism.

Under the feudal system all landholders were nominally tenants and no absolute rights of property were recognized except in the sovereign or the community or in the sovereign as the representative of the community. But the tenants in chief were of the status of petty rulers and in the position of effective ownership for many economic purposes, while the position of subservient (base) tenants varied from that of the serf, who was part landholder and part slave, to that of the socager, who owed his lord no menial services and was almost a freeholder. In England the servile tenants paid their dues in services and in kind from before the Norman Conquest to the beginning or the middle of the fourteenth century. Some rents were paid in cash or in fixed amounts of produce soon after the Black Death (1346-50), and by 1400 cash tenancy had emerged in both England and Scotland. Tenancy leases had appeared in France and Flanders at the end of the thirteenth century. But produce rents continued side by side with cash rents in England until the end of the eighteenth century and in some parts of Europe into the twentieth century. The payment of fixed rent in either cash or produce, as distinct from a share of produce and unaccompanied by any personal service, emerged as the distinctive feature of tenancy in the fifteenth century; rents were more commonly fixed and paid in cash after the influx of silver in the sixteenth century and after the development of the practise of collection of national dues and revenues in cash rather than in services or kind.

The different courses of feudal development and decay in the various countries of Europe gave rise to varied systems of land tenure and use. In parts of Italy and France, for instance, *métayage* followed the breakdown of the feudal system; and in other parts of France feudal elements in tenancy remained until the revolution established peasant proprietorship. In Holland and Belgium tenancy developed on a large scale, and in Great Britain it became almost universal. Belgian tenancy evolved from feudalism through *métayage* and *cheptel* (stock and land lease), a half way house between *métayage* and cash tenancy. The stock and land lease was also known in England but was not common there. The tendency toward the establishment of owner occupiers or yeomen farmers in England in the seventeenth and eighteenth centuries and their decay in the early part of the nineteenth century in favor of tenancy illustrate the devious course of historical changes in this field.

It must be clear that the economic position and the social status of tenants of farm lands have varied from country to country and from age to age. In the early days of tenancy in Rome it would appear that although the tenant was in a dependent position no great social difference arose between tenants and proprietors who were otherwise of about the same rank, and it was not until after the beginning of the Christian era that a clear distinction was made between colonus, who was a cultivator, and dominus, who was a proprietor. The political laws of England from the sixteenth to the early nineteenth centuries, especially the electoral law and custom, gave a higher status to the freehold owner than to the tenant, although the wealth and income of the latter might be much higher than that of the former. But by the latter half of the eighteenth century such economic and social inferiority of the tenant as lingered from feudalism had disappeared. The gentleman farmer might be a tenant, while the freeholder might be a peasant cultivator with little better income than the wage earner.

The economic position and the social status of tenants have varied with their personal or social origin and the degree of independence given them by their leases as well as with the size and productivity of their holdings and the resultant variations in their incomes. When the Roman landlord made his slave a tenant, with or without providing equipment for cultivation, the tenant was bound to retain a degree of inferiority; the same conditions recurred in the

southern United States; and when the German or English villein released from some of his feudal bonds became a tenant, a tinge of his former status still remained. But where there have been no social barriers between owners and cultivators most of the differences between owners and tenants have disappeared as the wealth and income of the two groups have become approximately equal. Nevertheless, in many and perhaps most parts of the world where progressive agriculture has been established the glamour of ownership has persisted.

The economic status and circumstances of the tenant vary closely with the extent of the property interests given by the contract or lease and with the customs under which he cultivates. The mere cropper, or share, tenant may have no economic interest in the land apart from its contribution to the current crop. He may be "here today and gone tomorrow"; the owner gives him orders and supervises his activities. But the cultivator under a lease has definite rights which are protected by law or custom and often both. There are indeed forms of tenancy in which the tenant's interests in the holding are as large as those of the owner of the soil. Under the Ulster system of tenant right the tenant provided buildings and permanent equipment for farms, and his right to compensation for improvements sometimes represented more than half the total capital value of the holding. Farm tenants in the French speaking regions of Belgium propose their successors to their landlords, having previously come to an agreement with the proposed incomer on the subject of valuation of the outgoer's improvements. The "Evesham custom" in Worcestershire, England, gives the tenant the right to dispose of his interests to an incoming tenant subject to the owner's acceptance of the incomer, which is rarely refused. Similar practises exist by custom and usage in Picardy. Customs or laws giving such rights in effect reduce the fundamental owner to the position of a receiver of ground rents.

Various degrees of property interests and of security of tenure are given to tenants under their contracts or leases. The common forms of tenancy have been tenancy at will, tenancies from year to year, tenancies for terms of years and perpetual leases. Tenancy at will, known to Roman law as *precarium*, might be terminated at any time by the will of either of the parties. The legal system of England, as of most other countries in which tenancy at will has arisen, has always tended to show disfavor to this form as

being contrary to the public interest and likely to be harsh on the tenant. Tenancies from year to year, in practise for one year and then from one year to another until notice to terminate is given by one of the parties, are theoretically short term leases. But in practise agreements for tenancies from year to year may subsist for long periods. There are well authenticated cases of continuous occupation of one farm by one family for two or three generations under such agreements in England. Leases for periods in Great Britain usually run for five, seven, fourteen or twenty-one years with provisions for renewal, but leases for the longer periods have tended to disappear. On the whole it is probable that tenancies subsist for longer periods under the year to year agreements than under leases for periods of years. The average period of occupation of one farm by a farmer in England has been about fifteen to sixteen years, which is longer than the average period of occupation for one farm by farmer owners in the United States. In Belgium the duration of leases is dependent upon the type of crop or cropping system followed. For arable land it may be one year but is more commonly three years and extends to six or nine years. Grassland is commonly let for one year but also for three, six or nine years. But tenancies do not necessarily terminate with the termination of current leases and may subsist for long periods. Owners and tenants entering into verbal agreements leave to law and custom the duration of the tenancy and conditions other than rent. Tenants by *emphyteusis*, holding perpetual leases, have been hardly distinguishable from owners in some parts of Europe.

Where systems of tenancy have long been established, systems of tenant right develop either under the law or by usage and custom and sometimes by both. Roman law contained provision for the protection of the interests of both tenants and owners. Where tenancy developed from feudalism, some customs of the manors attached to base tenures were transferred to cash tenancy systems; but the new system of tenancy also required new customs especially as agricultural practises developed and became more elaborate. In England there was a steady growth of practise and custom during the eighteenth century and the early part of the nineteenth, when customs having the effect of law began to be recorded. Disputes between owners and tenants arising from changing conditions led to closer examination of the rationale of existing customs. In 1875 Parliament passed the first Agricultural

Holdings Act, which gave general legal foundation for tenant right in certain improvements; and since 1880 the general body of law of tenant right as embodied in statutes and judicial decisions has greatly extended and developed. In England the law overrides provisions in individual leases; in Belgium, on the other hand, where also an extensive body of tenancy law and custom has been built up, the lease is the prime source of legal rights regulating relations between owner and tenant and the provisions of leases sometimes override the fundamental law. On the whole there has been less development of custom and law governing conditions of tenancy where it has grown out of a general system of cultivation by small owners, but almost everywhere some accepted usages and common (although not necessarily legally recognized) customs tend to regulate relations between owners and tenants.

Controversies between owners and tenants have frequently centered round the subjects which in the nineteenth century became known as the three F's: fair rents, fixity of tenure and freedom of cropping, to which was added later freedom of sale of produce; but in some localities and periods the political and religious freedom of tenants has also caused trouble. Demand on the part of tenants for fixity of tenure or stability of rents has sometimes arisen from changes in economic conditions which tended to raise the rental value of land. More often, however, fixity of tenure or alternatively provision for compensation for improvements made by the tenant became necessary as agricultural practises developed and traditional systems no longer sufficed. The demand for freedom of choice in the rotation of crops arose especially where the production of new "cash" crops was profitable to cultivators. But owners were unwilling to depart from traditional rotations which were known to preserve the fertility of the soil. Demand for freedom of sale of crops arose from the same circumstances. In Great Britain the questions of security of tenure, of freedom of cropping and sale of crops, have been settled by statute law and some degree of fixity of tenure has been secured to tenants by provision for compensation for disturbance on grounds other than those of bad husbandry. In Scotland and in Ireland some rents are fixed under statute law by procedure of a semijudicial character. Where tenancy systems are general and strongly established there is no absolute fixity of rents. In Great Britain and Holland, for instance, many adjustments of

rents are made in periods of economic depression without termination of tenancies, either through the fixing of new rents or through remission of a portion of the fixed rent for a period of time. But the question of "fair" rents appears almost chronically under all tenancy systems. Excess rents may easily prevent tenants from getting their due earnings or profits, and in some localities and periods there has been general exploitation of tenants.

Criticisms of general systems of tenancy have been made on many grounds; it is claimed, for example, that they fail to induce full economic use of land or alternatively that they tend to its uneconomic exploitation; that they are economically unjust to tenants; that they tend to restrict the personal liberty of tenants; and that they tend to economic or social instability. Arthur Young's aphorism that "the magic of ownership turns sand into gold" has probably done untold damage. The general view, in some countries a result of presumption or general principle, in others possibly of experience, is that ownership of land is economically and socially more beneficial than tenancy; and in particular that ownership creates far greater incentive to economic effort and enterprise than the most secure form of tenancy. The economic and social effects of tenancy, however, are very largely conditioned by the legal and political environments amid which they exist. Where conditions of tenancy are governed by adequate laws, customs or usages and where these evolve and expand with developments in agricultural practises, systems of tenancy may yield economic and social results equally beneficial to those of any system of ownership cultivation. In some respects such systems are economically more elastic than peasant proprietorship and on occasions they tend to be more rapidly adjusted to changes in general economic conditions. They are sometimes to be preferred to cultivating ownership where nominal ownership is accompanied by heavy encumbrance of mortgage debt. It has been said that from the agricultural standpoint the system of tenancy is more applicable to crops of which the cycle of production is completed within one year than to rotations of crops or to single crops which require a number of years for full realization of economic benefits. This view tends to confuse tenancy under which considerable and continuing interests in land are created and cropper or mere labor systems in which the interest in labor is greater than that in land. Only crude and undeveloped systems of tenancy

are inapplicable to intensive or complex farming practises. Tenancy has provided useful systems of division of function in the supply of capital, of management and of labor and under some circumstances has led to more effective use of capital and labor than could have been secured under any other system. It does not necessarily lead to economic, political or social instability or to waste of resources in land. The rise of radical or socialist movements for a time caused fears of the association of tenants with proletarian workers in more or less revolutionary movements. Such views were prevalent in France and Italy in the early twentieth century when syndicalist doctrines were gaining a certain foothold among the *métayers*. In contrast the class of small proprietors were assumed to be reliable supporters of the status quo. There is comparatively little in recent or contemporary experience to support these fears or views.

The most intricate of tenancy problems are those connected with the personal or political and religious liberty of tenants and with the development of social organizations and institutions in areas in which tenancy predominates. Where the tenants normally expect to remain as tenants, where they are attached to definite localities and where, as is usual in such circumstances, their interests are fairly protected by law or custom, there develop social institutions of equal efficiency with those established by communities or proprietors. But where, as in more recently developed countries such as the United States or some of the British dominions, the tenant regards his present occupation as a stepping stone to ownership, where he has little attachment to any locality and where, as is often the case, there is comparatively little protection of his interests by clearly recognized custom or by law, a low degree of development of social institutions is a natural corollary. Conflicts in regard to personal or political liberty tend to arise more often where owners and tenants are of different races or religions, but it is also natural that in periods of political stress owners of land should attempt to use their superior economic status to influence the views and activities of their tenants. Again, actual conditions in this sphere depend on general factors in the social environment, on the general political laws of each country and on the provisions for the protection of the tenants by law or custom. Where cash tenancy exists in the United States or in the British dominions little or nothing is heard concerning political or religious op-

pression, and in some parts of the continent of Europe the tenant is as free as the occupying owner.

A. W. ASHBY

UNITED STATES. Farm tenancy refers to the status of the farmer who hires the farm which he operates, giving for the use of the land either a stated fraction of the crops or other products (share tenancy), a fixed money rental (cash tenancy) or sometimes a combination of the two. The share tenant may work under close supervision by the landlord, as is the case with the southern "cropper," although a large percentage of share tenants and most cash tenants receive little or no supervision except in the form of general provisions in the lease contract, such as a clause specifying the crop rotation to be followed. Farmers who own some land which they operate and hire additional land are classified in the United States census as "part owners" rather than as tenants, although they control in the aggregate a considerable fraction (26.7 percent in 1925) of the total acreage of rented farm land.

Farm tenancy differs so widely in its nature and incidence in different parts of the country that it is hardly possible to generalize in very specific terms for the United States as a whole. On the one hand, farm tenancy may be only a form of contract through which labor is kept on the farm to the end of the crop season; on the other hand, it may be a device through which a highly competent farmer with limited capital is enabled to put into operation the most efficient methods of farming. All types of tenancy have some points in common, nevertheless. The tenant must always work without the stimulus of land ownership, and the tenant farm usually suffers to some extent from the lack of an owner's care. Every tenant farmer is likely to feel that he is subject in some measure to the will of the landlord and that the products of his own enterprise accrue in part to the benefit of the landlord. All that is possible here is an examination of the extent to which American farms have been operated by tenants in recent years, with a very general survey of the different types of tenancy.

Farms were first classified by tenure in the Agricultural Census in 1880, when 1,024,601 farms, or 25.6 percent of the whole number, were returned as operated by tenants. There was a certain amount of farm tenancy even in colonial times, particularly in the older settlements,

but so long as free land was easily obtainable by going farther west, first across the Alleghenies, then into the Northwest Territory, then across the Mississippi, men without capital who wanted farm land were likely to seek such free land rather than to rent farms, except as a temporary arrangement.

Considerably more than one half of the tenant farms reported in 1880 were in the southern states, forming 36.2 percent of the whole number of farms in the south. The development of farm tenancy in the cotton states followed the breaking up of the old pre-Civil War plantations. After the emancipation of the slaves some of the plantations were worked by hired labor, but more of them were broken up into small holdings, each leased to a tenant. Many of the tenants who now operate these holdings are of a special type whose status is on the border line between that of a tenant and that of a hired laborer. These men, who are locally known as "croppers," supply little or nothing in the way of farm implements or livestock and work for the most part under close supervision; one might say that they differ from hired farm laborers only in that they receive their wages in the form of a share of the crop rather than in the form of a monthly or weekly wage. Nevertheless, these croppers occupy their farms, averaging about 40 acres, under a rental contract or agreement, and for this reason they are included in the total number of tenants recorded in the farm census. Croppers are of numerical importance only in the southern states, where they formed more than four tenths of all tenant farmers in 1930—about one third of the white tenants and considerably more than one half of the colored tenants.

In general, a larger percentage of the tenants in the south work under the supervision of the landlord or his representative than elsewhere. The tenant farms in the south, even omitting the holdings of the croppers, are smaller and lower in value than the farms operated by owners, whereas in the north and west the average value and average acreage of the tenant farms are considerably in excess of the averages for owner farms.

Even outside the south, farm tenancy had developed to a considerable extent in 1880, as indicated by the census figures. In Illinois 31.4 percent of the farms were operated by tenants; in Missouri 27.3 percent; in New Jersey 24.6 percent; and in Iowa 23.8 percent. The average for all the northern states taken together, how-

ever, was only 19.2 percent and for the western states 14.0 percent

In 1890 the percentage of farms operated by tenants in the United States as a whole had increased to 28.4 (as compared with 25.6 in 1880) and in 1900, to 35.3. The rapid increase between 1890 and 1900 was partly if not mainly the result of the disappearance of free land; for by 1900 practically all of the desirable farm land available for homesteading had been taken up.

The percentage of tenancy in 1910 was 37.0; in 1920, 38.1; and in 1925, 38.6. These figures would indicate that during the first quarter of the present century tenancy was no longer making rapid growth. As a matter of fact, however, these changes in the percentage of tenancy for the country as a whole were the net result of large increases in certain states, partly offset by decreases in other states. Between 1920 and 1925, for example, the net increase in the number of tenant farms was only about 8000, but this was the resultant of an increase of about 150,000 tenant farms in 23 states, nearly offset by a decline of 142,000 in the number of tenant farms in 25 other states.

Between 1925 and 1930, however, the number of tenant farms increased from 2,462,208 to 2,664,365—an increase of 201,757, or 8.2 percent, while the whole number of farms declined slightly (from 6,371,640 in 1925 to 6,288,648 in 1930). The percentage of tenancy was thereby increased from 38.6 to 42.4. The number of tenant farms increased in 32 states, the total increase in these states amounting to 241,340, from which is to be deducted the decrease in 16 states, amounting to 39,583. In 9 of the 16 states showing a decrease in the number of tenant farms there was a still greater decrease in the total number of farms, so that the percentage of tenancy shows an increase in 41 states in all. The increase in tenancy during the last five-year period is therefore much more general as well as much greater in absolute amount than in the preceding five-year period. Many factors have contributed to this situation; one which has acted quite generally has been the agricultural depression, which has forced many farmers who held their land under mortgage into the tenant class.

There appears to have been throughout the whole period a rather close relation between the agricultural development of the several states and the advent of growth of farm tenancy. In the New England states, for example, farming was old before the supply of free land farther

west even approached exhaustion. As a result of this situation, supplemented by the fact that much of the New England farm land was of poor quality and therefore not very attractive to a tenant, the percentage of tenancy in these states never attained a very high level; and it has been declining since 1900 (except for slight nominal increases in 1930 as compared with 1925). In the middle Atlantic states also the maximum percentage of tenancy was attained in 1900, since which time there has been a continuous and rather rapid decline. In three of the states of the east north central division, Ohio, Indiana and Michigan, the maximum was reached in 1920, with appreciably lower figures in 1925 and 1930; in Illinois, while the 1925 percentage was lower than the 1920, the 1930 figure is slightly higher; and in Wisconsin there has been a continuous increase up to 1930. All of the states of the west north central division except Missouri show a continuous and fairly rapid increase in the percentage of tenancy, North Dakota presenting a rather spectacular increase from 2.1 in 1880 to 35.1 in 1930.

The growth of tenancy in the three southern divisions has been maintained with local irregularities since 1880, all three divisions starting with relatively high percentages (35 or more) in that year and showing in 1930 percentages uniformly higher than any of the northern or western divisions or states. In 1925, to be sure, 8 of the 16 southern states showed a percentage of tenancy lower than in 1920, but in all except Delaware and Maryland this loss was more than

made up by the increase which appeared in 1930.

In the mountain division the percentage of tenancy has increased rapidly from 7.4 in 1880 to 22.2 in 1925 and 24.4 in 1930. In the Pacific division the percentage of farms operated by tenants has fluctuated considerably, being in 1925 slightly less than in 1880 (15.6 as compared with 16.8) but increasing in 1930 to 17.7, or slightly more than the 1880 figure.

The trend of farm tenancy in the several geographic divisions and sections is indicated by the figures in Table I.

In the census reports tenants are classified on the basis of the form in which the rent is paid, the simplest classification showing only share tenants and cash tenants. The most detailed classification is that of the 1920 census, which is summarized in Table II. Croppers and standing renters (tenants paying as rent a stated quantity of product) were tabulated separately only for the south, the relatively small numbers of cases found elsewhere being included respectively with share tenants and cash tenants. Even this classification does not indicate the variety of relationships which may exist between landlord and tenant.

For an appreciable percentage of all American farm tenants tenancy represents a step on what has been termed the agricultural ladder, by which a young man starting as a farm laborer becomes successively a tenant, an owner subject to mortgage and finally an owner free from mortgage debt. The statistical evidence support-

TABLE I
PERCENTAGE OF ALL FARMS IN THE UNITED STATES OPERATED BY TENANTS, 1880 TO 1930

GEOGRAPHIC DIVISION OR SECTION	1930	1925	1920	1910	1900	1890	1880
United States	42.4	38.6	38.1	37.0	35.3	28.4	25.6
New England	6.3	5.6	7.4	8.0	9.4	9.3	8.5

ing the theory of the agricultural ladder is found in the classification of farmers by age and tenure, which is available for four censuses, 1890, 1900, 1910 and 1920. These figures show in general that a large percentage of the farmers under 35 years of age are tenants, while the percentage of tenancy declines rapidly as one goes on to the higher age groups. Specifically, in 1920 in the United States as a whole 75.8 percent of the farmers under 25 years of age and 56.5 percent of those from 25 to 34 were tenants, while only 16.5 percent of those 65 years of age and over were tenants. Another 1920 tabulation shows that of all owner operators of farms in the United States 44.3 percent had operated farms as tenants previous to becoming owners.

Except for those who are definitely looking forward to the ownership of the farms they occupy, the typical American farm tenant does not stay on one farm very long but moves from one to another. Of the whole number of tenants reported in the 1920 census, 43.4 percent had been on the farms where they were enumerated less than 2 years, and 31.2 percent had been there from 2 to 4 years, leaving only 25.4 percent with a record of 5 years or more on the same farm. This practise of staying but a short time on one farm is the result partly of the prevailing type of lease, which usually runs for but one year, partly of the type of men who remain permanently in the status of farm tenant, and partly perhaps of the characteristically American desire for change.

The idea is widely current that farm tenancy is more likely to be found where farm land prices are high than where they are low. To some ex-

tent the statistics support this idea. Both the percentage of tenancy and the price of farm land are very much higher in Iowa than they are, for example, in New Hampshire or Montana. On the other hand, the percentage of tenancy in Alabama or Mississippi is even higher than in Iowa, although prices of farm land in these southern states are relatively very low. Leaving the southern states out of consideration, however, the correlation between land prices and the extent of tenancy in the different parts of the north and west seems to be fairly good. Theoretically the relation is reasonable. The higher priced land is usually more productive, thereby making it possible for a tenant to pay rent out of the returns from its operation; and, on the other hand, the high priced land is more difficult to purchase, thereby compelling would be farmers to rent the land at least for a time for lack of the capital requisite for its purchase.

Furthermore, the amount of rent charged for the better grades of farm land is often relatively low as compared with the current rates of interest on farm loans. A tabulation of the 1920 census returns for cash rent paid, in conjunction with the value of the rented farms, covering more than 30 percent of all the cash tenant farms in the country, showed that the annual rental formed only 3.54 percent of the value of the farms involved. In the state of South Dakota the cash rent represented only 2.52 percent of the value; in Nebraska, 2.59 percent; in Minnesota, 2.86 percent; in Iowa, 2.88 percent; and in Illinois, 2.97 percent.

Until rather recently the price of farm land had been increasing so rapidly and so generally

that such land could be considered a good investment from the point of view of its price increase alone. The purchaser of farm land, in other words, not only had the use of the land, but also received the increase in its value, this latter speculative element amounting in many localities over a period as long as 20 years to an average annual income in excess of the 3.54 percent return referred to above. The tenant of course got nothing but the use of the land in return for his rental payments, while the landlord received the increment in value in addition to the rent.

Under present conditions the future course of farm land prices is very much in doubt. With improved methods of farming and with declining demand for certain products, especially those formerly grown as food for farm work stock, there would seem to be too much farm land already under cultivation. Under such conditions one would hardly look for any very great increase in farm land prices in the immediate future. Whether this disappearance of the speculative advantage of farm ownership will result in extensive further increases in tenancy remains to be seen.

Tenancy has certain general effects on the method of conducting farm operations. In the first place, the farm tenant is not likely to make improvements in the soil or in the farm buildings, since he cannot be sure of continuous use of them. Improved types of farm leases, desirable as they are, would overcome this difficulty only in so far as tenancy became more stabilized and the tenant less inclined to move from farm to farm. In the second place, he is likely to try to get out of the soil as much in the way of salable products each year as he possibly can, since he cannot be certain of another chance next year. On the other hand, the tenant who has carefully considered the relative advantages of buying and hiring a farm and has decided to invest his capital in stock and equipment rather than in land may be better supplied with machinery and livestock than other farmers of equal initial capital who decide to purchase farms. He may even use more up to date methods; and many farm surveys have shown that tenant farmers under these conditions make larger incomes than owner farmers occupying similar farms in the same neighborhood.

Nevertheless, there seems to be current among the rural inhabitants of the United States a strong prejudice in favor of ownership as against tenancy. Ownership does possess certain very

definite advantages, chief of which is perhaps the fact that the owner unless he is too heavily mortgaged has assurance of continuous control of his farm. There are also certain intangible features, certain incentives, which enable—or compel—a man to work more diligently on his own farm than he would ever do on a rented farm.

Farm tenants in general have a decidedly lower social standing than farm owners. This fact is perhaps largely chargeable to the short term contracts under which farm land is usually rented in the United States and to other incidental conditions which might be remedied through improved forms of rental contracts and rental practises. As matters stand, however, the tenant farmer lives in a poorer house; he has no incentive to make improvements in the residence since it is not his; and the landlord likewise has no incentive to make improvements so long as the tenant will worry along with conditions as they are. Tenant farmers take less part in the organized activities of the locality in which they live; they accumulate less adequate household equipment, especially when frequent moves are in prospect; and in general they profit less from those collective activities which distinguish an enterprising community from a backward one. Without doubt the less enterprising men gradually drift into the class of tenants or remain there permanently in place of advancing into ownership, so that the social condition of the tenant group as a whole is to some extent the result of this adverse selection.

An important modifying factor in the farm tenancy situation, especially in the northern and western states, is the fact that a considerable percentage of the tenants are closely related to their landlords, the percentage running as high as 40 in the state of Wisconsin and materially higher in individual counties. This percentage is based on the results of a question carried on the 1925 farm census schedule, which read: "Do you rent this farm from your own or your wife's parent, grandparent, brother, or sister?" For the United States as a whole, excluding the south, close relationship to the landlord was returned in 1925 by 26.6 percent of the cash tenants and 29.1 percent of the other tenants.

This relationship, which is doubtless partly responsible for the low rent paid by many cash tenants, should receive serious consideration in other connections. Many of the undesirable features which are currently charged to farm tenancy must surely be modified in these cases.

The farm rented from the operator's father or father-in-law is likely to come into his possession eventually by inheritance, even though he does not accumulate sufficient capital to purchase it on a strictly business basis. The tenant on a farm of this type is just as likely to be a permanent resident as if he were already the owner, and his place in the social activities of the neighborhood is likely to approximate that of an owner.

FARMER LABOR PARTY, UNITED STATES. See PARTIES, POLITICAL; AGRARIAN MOVEMENTS.

FARMERS' ALLIANCE. The Farmers' Alliance, the second effort in the United States at national organization of farmers for defense and advancement of common interests, had its origin in farmers' clubs, which by the middle of the nineteenth century had been organized in virtually all parts of the country and by 1858 had begun to federate on state lines. In the newer sections of the west and southwest, where law and order were not established, cattle and horse thieves committed constant depredations and settlers were often in danger of losing title to their lands because of litigation instituted by so-called land sharks. The first objective of these clubs was protection against such dangers, but they soon came to serve other functions, such as promoting agricultural education and providing social activities. Some also practised cooperative buying and selling.

During this period western farmers gave financial support to the construction of railroads to transport their products to eastern markets. For many years, however, freight rates were high and railroad regulation became a

burning issue. Furthermore, interest rates in the west and southwest ran as high as 15 to 20 percent. But the greatest cause of farmers' discontent from 1865 to 1896 was the steady decline of the price level, which was interpreted to mean that farmers were being exploited in various ways by manufacturing, transportation, merchant and financial groups through unfair trade practises and the enactment of unfavorable legislation. Middlemen were charged with combining to depress the prices of farm products. These conditions created widespread discontent and caused farmers to seek relief through organization.

After the decline of the Grange in 1876, the south and a large part of the west were without any but local organizations, and the Farmers' Alliance, in process of development at the time the Grange had attained its largest growth, expanded to fill the need. On the basis of copies of organization plans carried from Kansas into Texas and western New York two alliances were founded. The Texas Alliance was by far the more virile of the two organizations. It spread rapidly eastward over the Gulf states and into other parts of the country and soon became the dominant farm organization of the United States, the result in large part of the energetic and effective leadership of Dr. C. W. Macune. While it was secret in character, its members were all of one degree, a much simpler plan than that of the seven degrees used by the Grange. It excluded Negroes and included women and although supposedly limited to farmers had in its ranks many political aspirants and professional persons seeking the patronage of a large organization. Its legislative program included demands for the abolition of national banks and the issue of treasury notes according to need as a medium of exchange.

To gain new territory the leaders of the Texas Alliance did not depend alone upon organizing new local alliances but consolidated with other organizations wherever possible. Thus in 1887 a consolidation was effected with the Louisiana Farmers' Cooperative Union, the name of the combined organization becoming the National Farmers' Alliance and Cooperative Union of America. In 1888 a second consolidation was effected, this time with the National Agricultural Wheel, which had previously absorbed the Brothers of Freedom. These latter organizations originating in Arkansas had by 1887 spread to seven other states. The Wheel brought 500,000 members into the Alliance,

which now became known as the Farmers' and Laborers' Union of America.

Strong efforts were made to effect a union with the Northwest Alliance, the outgrowth of the New York Alliance, which was dominant in Iowa, Nebraska and Minnesota and in 1889 had an estimated membership of 400,000. While the legislative programs of the two alliances were similar, the non-secret, loosely organized character of the Northwest Alliance and its policy of admitting Negroes to full membership made consolidation impossible. Organizers were therefore sent out to capture the Northwest's territory for the larger organization, which by 1890 was truly national in scope, with an estimated membership of 2,000,000. In addition other organizations, such as the Farmers' Mutual Benefit Association of Illinois and the National Colored Farmers' Alliance of the South, were subsequently brought into the Alliance family by means of a joint confederation committee whose task was to determine policies to be executed by the respective associations. Its name now became the National Farmers' Alliance and Industrial Union.

Finally a loose combination was effected with the Knights of Labor, whereby common action of the congressional lobbying committees of the two organizations was secured on the questions of national banks, a subtreasury system, the prohibition of dealing in futures of "all agricultural and mechanical" products, the free coinage of silver, the abolition of alien ownership of land, the opening to settlers of land held by large corporations, the prevention of the use of the taxation power to build up one interest or class at the expense of the other, the limitation of state and national revenue to cover expenses, the issue of fractional paper currency to facilitate exchange through the mail, government ownership of railroads and means of communication.

Up to 1890 the Alliance, fearing dissension and destruction, consistently avoided partisan politics. In 1886 it resolved "that as citizens we have a right to belong to any organization, political party, or church, we may see proper, but as a Farmers' Alliance we will not consider such subjects within our body." The failure of some of the old projects, such as that for co-operative credit to carry the farmers through the planting season, and the rise of the demand for government warehouses coupled with the scheme of issuing Treasury notes secured by farm products delivered to the warehouse, prob-

ably influenced some leaders to support political action. The Alliance's attitude definitely changed with the success realized from the decision of the national convention held at St. Louis in 1889 to support candidates who favored Alliance demands. As a result of this, they elected several governors and United States senators, and some thirty congressmen in the fall of 1890. Despite the continued opposition of Macune, sentiment grew through the west and northwest in favor of establishing a political party devoted to farmers' interests. At the Alliance convention held at Cincinnati in 1891 a party was launched whose platform, modeled on Alliance programs, demanded "free coinage of silver, abolition of national banks, loans on land and real estate, sub-treasuries, income tax, plenty of paper money, government control of railroads, election of President, Vice-President and Senators by direct vote, non-ownership of land by foreigners, revenue of the state and nation limited to expenses, eight hours' work, and universal suffrage." Against the adoption of the eight-hour plank vigorous objections were made that farmers often work as long as "sixteen hours and never less than twelve." After the convention of 1892 the Alliance disintegrated almost precipitously and became rapidly transformed into the People's party.

FARMERS' ORGANIZATIONS. There is a natural history to the somewhat anomalous fact that the prevalence and permanency of farmers' organizations have never been identical or co-equal with the need for them. The need for rural organization has varied with changing economic and social conditions, while farmers' conscious-

ness of their need for organization has depended to a very great extent upon the degree to which the system of agriculture in which they engage has developed from isolation toward commercialization. Among primitive and even among pioneer farmers the predominant types of association are kinship, neighborhood, village and other groups based on sociability. Among highly commercialized farmers economic types of organization such as cooperatives for buying and selling, mutual insurance and cooperative credit organizations predominate. Farmers' political associations have generally followed upon the recognition of economic issues—a stage reached only when farming has definitely attained the status of commercialized agriculture.

At all times farmers' organizations have exhibited a great diversity of form and in most cases a marked looseness of structure and purpose. Early rural associations were only to a slight extent class organizations, although a very definite awareness of group disabilities has existed in many unorganized rural communities. Cleavages between landowner, tenant and laborer have at times resulted in the formation of mutually antagonistic farmers' organizations, and impermanence has characterized most large scale associations of farmers. Localism and individualism explain many of the difficulties of agrarian organization; these two factors have not disappeared, but their operation has been modified by modern industrial and commercial culture. One can trace, however vaguely, a certain line of development in the history of farmers' organization. The basis for such generalization may well be sought in a rapid survey of the prevailing types of rural associations to be found throughout the world today. In the Orient kinship, tribal and village associations are still the characteristic forms of rural organization.

While there are associations such as the cooperative credit societies in India, the village community (*q.v.*)—containing, of course, others than cultivators of the soil but existing chiefly for them—prevails everywhere and comprises the chief type of rural organization. In China the family system overshadows every other type of social and economic organization. It dominates agricultural organization to an even greater extent than it does other aspects of life. In some sections of the country, chiefly north China, there are now appearing some cooperative enterprises, notably village banks. A folk school movement patterned on the Danish is also gaining slight headway in China and it is possible that

the development of cooperative societies will follow naturally in the path of this movement.

In Japan there were a few semicooperative farmers' organizations in the early nineteenth century, and in the twentieth century there has taken place under government supervision a rapid expansion of cooperative societies based on European models. Other than this rural organizations are few, probably because of the fact that small proprietors are geographically interspread with thousands of tenants. The possible formation of a sort of tenant labor union is indicated by growing disputes between landlord and tenant in recent years.

In South Africa there have been for many years practically no farmers' organizations. There, as in some South and Central American countries, the farming class and its interests have been overshadowed by mining and industrial as well as by intense political and racial issues. As a consequence the farmers have been sharply divided, and where they have as a class combined to any extent for concerted action it has been through political party manoeuvres or to obtain governmental aid. In recent years, however, rural cooperative credit, purchase and sales organizations have been developed on a small scale.

In Australia and New Zealand the history of rural organization has been more like that of the United States and Canada. In Australia wheat and wool pools (cooperative marketing organizations) have wielded great influence. In New Zealand a powerful union of farmers aided the Reform party to power. In both countries labor parties, including in their ranks many farmers, have grown to influential status; and in both countries political parties and legislation have been freely used to uphold the causes of the farming class, as in the case of compulsory co-operative marketing of wheat in Australia.

In most of the South and Central American nations volunteer organizations of cultivators have been few and unimportant. The existence of large estates, haciendas or latifundia, owned by great landlords and companies and farmed by tenants has not been conducive to volunteer organization. In the western states of South America the village type of organization has continued, and although in many cases a system of peonage has developed this has neither destroyed the old neighborhoods and villages nor resulted in class consciousness of sufficient intensity to develop farmer class organizations.

It is in Europe and North America that farmers have developed a class consciousness suffi-

cient to stimulate rural organizations to something approaching nation wide scope. Even so the kinds of organization in these countries are so diverse as to make generalizations concerning types and causes difficult. The Raiffeisen societies in Germany and the Luzzatti banks in Italy make these nations outstanding in rural credit organization. Denmark, Switzerland and Ireland are best known in the fields of commodity cooperative marketing associations. In France there has been some slight development in both cooperative credit and marketing, but for the most part farmers' organizations in that country are technical brotherhoods or fraternities of producers. The mutual aid societies of France are little more than agencies through which social insurance funds are administered and supervised. There are also such social organizations as farm wives' circles and country foyers in France, the Swiss Peasants' Union in Switzerland, the Prévoyance Sociale in Belgium and some art and educational societies in Ireland.

The broad generalization may safely be made that in recent years social and fraternal rural organizations in Europe have had no success comparable with that of the economic institutions, unions and cooperatives, which have developed in many cases into great business enterprises. An outstanding contrast is presented by development in the United States, where until very recent years there has been little progress in cooperative organization and there have been only sporadic and transient attempts at political organization. In the prairie provinces of Canada and in the fairly recently occupied areas of the United States, where commercialized agriculture has predominated from the beginning of settlement, both economic and political organizations of farmers have been more frequently recurrent; but in other sections of North America either the universal neighborhood or large fraternal organizations have chiefly prevailed. Practically all of the large farmers' organizations, such as the Grange, the Farmers' Alliance, the Farmers' Union and the American Farm Bureau Federation, have attempted at one time or another to set up and operate business cooperatives of various kinds. The great majority of these business ventures not only failed but, together with political involvements in most cases, pulled the general farmers' organizations down with them.

There are two probable chief causes for the fact that European rural organizations have been for many years dominantly economic and rural

organizations in the United States until recently dominantly social and fraternal. First, farm life in the United States up to 1900 was chiefly pioneer life, and farming largely of a self-sufficient type. The commercial or market regime played a relatively small role in the average farmer's existence, and because of the favorable ratio of natural resources to population individual landownership was the dominant purpose of the great majority of those who farmed.

The second cause may be stated in more universal terms: probably in the history of rural organization in democratic societies general organizations have always preceded commercial and business societies. Throughout most of the world technical associations of breeders and producers, which remain of importance in all modern agricultural nations, probably represented the first step in class consciousness among farmers. In Scotland the Scottish Agricultural Organization Society began as a breeders' association. In the United States breed associations and agricultural and horticultural societies were almost universal before the first general farmers' organization, the Grange, was founded. Even earlier in some countries there were general mutual benefit types of rural associations. In France general organization preceded the *syndicats*. In Germany the general agricultural associations existed for almost one hundred years before specialized societies came into existence, and in Canada the farmers were organized into a social and educational society before the various provincial wheat pools were founded. In Ireland a definite organized educational movement was carried on antecedent to the organization of the purchasing and selling organizations.

The more highly specialized business organizations of farmers may perhaps be envisaged as the end product of a social process which may be called a farmers' movement. This movement has started with all types and kinds of rural societies and farmers' associations—fairs, technical improvement associations, fraternal societies and direct protest organizations based upon a discontent concerning rural status or a belief that farmers and even rural society were failing to "hold their own" in developing culture. In each instance, unless the organization of farmers eventuated in an uprising or revolt, such as the peasants' revolts of Europe, these associations and societies have slowly felt their way toward an attack upon the credit, price and market problem. Such clearly appears to have been the case in the United States and Canada and evi-

dences are not lacking that it has been the case in European and even in oriental countries.

An even broader generalization is that rural organization everywhere and in all times and places has concerned itself with the problem of obtaining a relatively higher standard of living for its constituency. In primitive and pioneer rural society standards of living are self-contained because farm folk have no means of comparison and no occasion to compare their standards of living with those of other segments of society. They therefore content themselves with social and fraternal associations. As soon as they obtain a means and method of observation of other classes they become aware of other standards of living and begin seeking to attain them. In a society so dominantly commercial as western civilization the means to a higher standard of living is almost universally sought through an adjustment to the price and market regime. If this generalization be true, one would expect oriental rural life, with the exception of Japan, to be still dominated by family, clan, neighborhood and village organizations; pioneer and near pioneer rural societies such as those in the United States, Australia, New Zealand and South Africa to be in a transition era; and those in the older, more industrialized and commercialized areas of Europe to have developed highly commercialized farming and strong rural business organizations. In general, such are the conditions which actually exist.

Since class political organization generally, if not always, awaits class economic organization, it is understandable why European nations have agrarian parties; why the commercialized wheat areas of the United States and Canada have nurtured a number of farmer political ventures; and why the granger legislation of the seventies, the Greenback and Populist episodes of the eighties and nineties and the Farm Bloc in the Congress of the United States have all been concomitants of farmers' economic upheavals. The stability and permanency of farm political organizations are therefore indirectly dependent also upon the degree to which farming in any area of the world has reached the stage of commercialization.

FARMERS' UNION. This, the third general organization created by the farmers of the United States, whose full name is the Farmers Educational and Co-operative Union of America, was founded in 1902 at the little town of Point, Texas. Among its founders were Newt Gresham and others who had been organizers and leading officials in the Farmers' Alliance, which had precipitously disintegrated in 1892, when together with the Knights of Labor it organized the People's party.

Although for more than a decade prices of farm products had risen more rapidly than those of non-agricultural products and the farmer's position had therefore been improving, per capita farm income was still relatively very low. Farmers condemned the demand for cheap food at the expense of their standard of living and hoped to improve conditions through the Union in part by the enactment of favorable legislation, but more especially by developing sound cooperative enterprises and the building of a credit structure to finance farm operations and return all profit to the farmers. Membership is limited to the white rural population and may include farm tenants as well as owners, country mechanics, physicians, clergymen, and newspaper editors who support Union policies. Women are eligible but pay no dues. Persons

actively engaged in banking, merchandising or the practise of law are ineligible on the theory that they extract large profit from the farmers and are unfriendly to the development of co-operative marketing and credit systems.

Like the Alliance and the Grange before it, the Farmers' Union grew rapidly when "joining" was a novelty and large benefits from organization were anticipated. By 1905 state unions had been established in Texas, Arkansas, Alabama, Georgia and Louisiana. In 1910 its total individual membership was about 121,800, with its greatest strength in the Gulf states. In 1919 it had more than 140,000 members, but by 1930 the total had fallen to 91,109. In 1930 the Union was strongest in Oklahoma, Kansas, Nebraska, Iowa, the Dakotas, Colorado and Montana. The dreaded reaction experienced by its forbears has affected the Farmers' Union, especially in the south, where it has almost completely disappeared. The instability of farm organization in the south is attributed to inefficient leadership and general lack of interest, probably due to the presence of a large proportion of tenant farmers, whose interest in a long term welfare program is difficult to maintain. Moreover, such projects as cooperative enterprises face great difficulties in a racially divided region.

From its beginning to 1917 the Union was a secret order. Opposition to secrecy developed because at first the national body rigidly controlled the ritual. Later special permission was granted to the Nebraska and Kentucky unions to devise rituals to suit local needs. Lack of uniformity finally led to the abandonment of secrecy. Democratic and religious arguments were made in favor of an open organization and a business manual was finally adopted in place of the ritual.

Following the lead of the Farmers' Alliance the Union has always maintained friendly relations with the more established labor organizations. Its national convention receives fraternal delegates from the American Federation of Labor, and in 1921 it stated the relation of organized agriculture to organized labor as follows: "The farmer is both a producer and a consumer. The laborer is both a producer and a consumer. Each is the principal customer of the products of the other." Officials state that they seek labor support for a legislative program beneficial to both groups, such as the curbing of trusts, prohibiting the dealing in futures or the enactment of satisfactory tax measures.

The Union contends that agricultural ills can be remedied only through a fundamental change of the economic order. The farmer himself must go into business and retain all profit that now accrues to those who furnish his supplies and market his products. The Union's outstanding activity has therefore been the promotion of cooperative enterprise, including the purchase of essential farm supplies, the sale of farm produce, the conduct of fire, livestock, hail and life insurance companies and of plants for manufacturing farm products for the market (creameries, pickle factories, etc.).

The Farmers' Union Exchange operates in the northwest as a cooperative buying agency and for some years has taken the entire output of the North Dakota state prison industries and half the output of the Michigan state prison industries for distribution directly to the farmers. The Farmers' Union Terminal Association, a grain marketing agency also operating in the northwest, handled 16,000,000 bushels in 1928. The Farmers' Mutual Fire Insurance Company, organized in 1925, had insurance in force in 1930 amounting to \$55,000,000. The Farmers' Union Mutual Life Insurance Company, organized in 1922, had \$12,500,000 of insurance in force in 1930.

It was as the result of a suggestion made in 1915 by the Union's president that the National Board of Farm Organizations, a clearing house for national agricultural problems and a united front lobbying agency of all farm organizations, was created.

FARR, WILLIAM (1807-83), English statistician. Farr was born of humble parentage and owed his chance of professional training to a friend. In 1829 he studied medicine under Orfila and Louis and hygiene under Andral in Paris, where he received his first impetus to the study of medical statistics. Upon his return to England he eked out his scanty earnings in medical practise by giving lectures on hygiene

and medical jurisprudence. In 1839 he entered the newly organized national General Register Office, with which he was associated until his retirement in 1879.

Farr is rightly regarded as the founder of the English national system of vital statistics. For over forty years he supervised the actual compilation of English vital statistics, introduced methods of tabulation which have stood the test of time and a classification of causes of death which has been the basis of all subsequent methods. On the basis of national statistics he compiled life tables still used in actuarial calculations and formulated practical lessons as to the causation and prevention of disease which have been a most powerful factor in determining the course of sanitary history and the triumphs of public health. He used most effectively comparisons of general and specific death rates in different parts of the country as pointers toward local reform and stated the laws governing the course of an epidemic disease, thus helping to lay the foundation of epidemiology.

Farr's most important works are in the form of comments and discussions contained in the annual reports of the registrar general of births, deaths and marriages and in the decennial supplements to these reports, for which he was mainly responsible. A large number of his observations are reproduced in a memorial volume issued by the Sanitary Institute of Great Britain, entitled *Vital Statistics* (ed. by N. A. Humphreys, London 1885).

Farr's influence extended to the continent. He took a prominent part in promoting international cooperation in the field of vital statistics, and if the study of this subject owes more to English data and observations thereon than to those of any other country during the nineteenth century, it is due chiefly to the work of William Farr.

ARTHUR NEWSHOLME

Consult: Newsholme, Arthur, "William Farr, the Father of English Vital Statistics" in *De Lamar Lectures, 1925-26* (Baltimore 1927) p. 203-20; Lukas, F. G., "William Farr" in *Statistische Monatsschrift*, vol. ix (1883) 496-500.

FASCISM. It is difficult to isolate by abstract analysis the distinctive feature of Fascism. Viewed either negatively or positively, it has elements in common with other systems of national organization. If defined simply as a negation of liberalism and parliamentarianism it is inadequately differentiated from communism

and other ideologies which manifest an equal antipathy to these older democratic tenets. Its analogy with varied types of administrative organization is strikingly indicated by the application of the very questionable term "international Fascism" to those ephemeral dictatorships which here and there during the aftermath of the World War practically displaced systems of popular representation, as well as by the present day use—especially among communists and social democrats—of the term as a derogatory epithet, a political catchword devoid of scientific precision. If, on the other hand, Fascism be defined positively as the unlimited sovereignty of the state over all phases of national activity it approximates the *nationalisme intégral* of a group as different as the Action Française.

It is only when viewed as a peculiarly Italian phenomenon that the essence of Fascism becomes clearly delineated. In its philosophy, its origins and development, its political structure and cultural aspirations, it is an integral part of the Italian matrix. The ideology of Fascism viewed historico-genetically is a peculiar fusion of syndicalist theory and the doctrines of Italian nationalism. While the former has gradually receded into the background, the latter has supplied the movement with its central intellectual pillar, the idea of the national state. The nation becomes transfigured into a *corpus mysticum*, an unbroken chain of generations, armed with a mission which is realized in the course of the historical process. The duty of the individual is to elevate himself to the heights of the national consciousness and to lose completely his own identity in it. He has individual rights only in so far as they do not conflict with the needs of the sovereign state.

This conception of the Fascist state, which is essentially a vigorous revival of the idea of nationalism as first developed during the French Revolution, is at the same time a repudiation of the political organization of the national state as set up during the century following the revolution. The rejection by the Fascists of Rousseau's dogma of popular sovereignty automatically invalidated the doctrine of natural rights as well as the infallibility of majority rule. "Broken up and dissipated among millions of citizens preoccupied as a general rule with their own private needs, popular sovereignty was distorted and can no longer be considered a practical expression of organic statecraft." The actual administration, in which "the entire life of the nation is concentrated," must be entrusted to a

limited number of persons constituting an organic unity. The action of the "dynamic" state must be, in contrast to that of the parliamentary system, "quick, sure, unanimous, conscious, responsible." Parliamentarianism was felt to be not only unwieldy but also by reason of the absence of a common outlook between modern parties ineffective; it ignored the "social forces" within the nation and had failed to cope adequately with the political and economic crisis in Italy during and after the war. Against the domination of Parliament and the majority principle Fascism advanced, as is indicated in the preceding quotations, the claims of the élite. Unquestionably it is here that the connection—often exaggerated and often groundlessly denied—manifests itself with Georges Sorel's philosophy of history, which sharply emphasizes the significance of the élite as the embodiment of the genius of a people, an institution or a class. Even when Fascism at a later stage of its development attempted to strengthen its position by harnessing the democratic forces of the state, as expressing themselves in the plebiscite, it was still acting consistently with its basic emphasis on the élite.

The idea of the sovereignty of the state is the very kernel of Fascist social and political theory. The contrast with the French Revolution as well as with the pluralistic conception of the state is apparent in the thesis that although the groups—the *attività sociali*, associations intermediate between state and individual—are to be recognized by the state they are to be strictly subordinated to serving the interests of the state. This conception leaves no room for class struggle, even were Fascism less emphatic in its insistence on the solidarity of capital and labor in the production process over and above their antagonism in the division of the social product. If all the vocations of the country were organized into one great syndicate, the postulate or state sovereignty would lead directly to an "identification of the economic system with the state," the peculiarity of which would consist in the fact that it would still be unwilling to renounce the dynamic force of private initiative. The legislation which sprang from these ideas will be considered later.

The historical beginnings of the Fascist movement are comprehensible only in the light of the severe political and economic crisis into which the World War had plunged Italy. Victory brought the realization of her irredentist aims, but in all her nationalist aspirations which

Fascism

went beyond this she was disappointed. She had emerged from the war without colonies; the Adriatic Sea, *mare nostrum*, was in other hands. Although the Austrian Empire had been shattered, the presence of the Slavic flank on the east constituted a new threat, which with additional consolidation might prove more dangerous than the old.

In addition to the discontent over the peace treaty there arose a great number of economic and financial difficulties. The productive forces of the country were in part destroyed, in part turned as a result of the war into false channels; the balance of trade and the state budget revealed enormous deficits; the debt to the Anglo-Saxon countries mounted still higher in spite of the termination of the war. On the other hand, the assets, so important in normal times, from "invisible" exports—the savings sent back to the mother country by emigrants, the revenue from tourists and commercial shipping—had sunk to almost nothing. Fortunes and income decreased to a great degree.

Impressed by the profound moral depression created throughout Italy by the international and economic situation the socialist parties, whose radical wings had persisted even after the defeat at Caporetto in their antiwar agitation and in the general situation in 1918 had found excellent material for propaganda, decided with encouragement from Moscow that the hour for action had arrived. An unbroken succession of strikes swept over the peninsula. Although concentrated more especially in the industrial and agricultural regions of northern Italy they radiated to the south, as far even as Apulia and Sicily. The political fate of Italy might have been different had there not intervened between the southern latifundia with their thick layer of agrarian proletariat and the northern Italian industrial area a broad intermediate zone inhabited chiefly by small property owners and tenant farmers essentially middle class in their material interests as well as in their intellectual and moral outlook. Socialism was to pay dearly for the advances which it made among these groups in the intensity of the subsequent antisocialist reaction. The valley of the Po was to be commemorated by Mussolini himself as the cradle of the Fascist movement. Even to the present time Fascism has not denied its agrarian origins. One of the most important sections of its legislation, the *Bonifica integrale*, is expressly designed to increase the number of small landholders.

In March, 1919, Benito Mussolini, who had

been one of the first to advocate the [redacted] Italy into the war on the side of the Entente, organized his *fasci di combattimento* as bearers of a Napoleonic will to power dedicated to a nationalistic syndicalist program, which contained in addition other heterogeneous elements. The social composition of these groups revealed from the beginning a significant peculiarity of the movement. It cut, as it were, vertically through Italian society and from all strata recruited its followers, who ranged from former service men to syndicalist agitators and workers, to students, to followers of d'Annunzio. The embryonic movement acquired a broader significance when in the course of time Mussolini dropped the trimmings of syndicalism and carried his agitation successfully to the urban and rural middle classes, who gradually attached themselves to the original inner nucleus of shock troops. Finally, with the adherence of members from the upper classes of society, such as the large landowners of the south and the industrial bourgeoisie of Lombardy, the problem of financial support for the party program became less acute. Thus the movement, which at first made no pretenses to formal party organization, consisted merely of the dynamic military minority and the larger group of loosely knit followers.

Mussolini's political tactics during the two years preceding his march to Rome on October 28, 1922, contributed in two significant respects to the later success of Fascism. First of all he carefully avoided saddling the movement in its infancy with a formal program. He consistently made it clear to the people that he relied not upon laboriously prepared and meticulously contrived programs, with which Italy in its political life was surfeited, but on an intuitive comprehension of the situation at hand and a rough and ready solution of it in the interests of the nation. This substitution of charismatic arbitrary leadership in place of a rigid program, which is in full accord with Italian political tradition, made it possible during the early struggles to enlist as active followers or at least as sympathetic observers recruits from all sections, although their only common meeting ground might be an enthusiasm for the national idea, combined with an antipathy to parliamentarianism and international socialism.

A second and more important feature of Mussolini's tactics during this preparatory period was the gradual penetration of Italian administrative and political machinery with his followers and the institution on a broad scale of

volunteer emergency groups which were set up in time of strike—most successfully, in the attempted general strike in the beginning of August, 1922—to keep the essential industries running. Where the state and especially the local representatives adopted a hostile attitude toward the new movement, the party proceeded to supersede them with its own organs—and thus to organize the “state within the state,” the *état postiche* of the French Revolution.

Italy had capitulated even before the Fascist march on Rome. This gradual “methodical” conquest of the state was a part of Mussolini’s revolutionary tactics and at the same time an indication of the empirical nature of Fascist development, which had characterized the entire movement up to that point. The interesting fact should be remembered that many of the most important Fascist institutions—the constitutional position of Mussolini, the Great Fascist Council, Balilla and Avanguardia as organizations for the education of youth—were set up first under the pressure of some immediate situation and only later given constitutional sanction.

The contention that Fascism constitutes a coup d’état rather than a revolution depends upon the definition that is given to these two terms. If Marx’ narrow definition be accepted and the term revolution be applied only to an overthrow of the ruling class by the ruled and to the establishment of a communistic society, then it is immediately clear that Fascism can raise no such claim. A more realistic definition of revolution, however, would include all those situations in which the tension within a state has reached a point where it is no longer possible to maintain a balance through normal means—the broader significance of the revolution depending, of course, on how fundamental are its effects.

It is impossible to understand the transformation of the Italian state resulting from the Fascist revolution except by an analysis of the party organization with its concentration of authority and its hierarchic membership. The Fascist party cuts through the horizontal layers of society, which with the aid of the arbitrary state government hold it together like a clamp. Just as in Soviet Russia, the party seeks through a host of auxiliary groups—associations of teachers, students, railroad men and the like—to extend to all spheres of modern life. Concentration of authority and hierarchy of membership imply that all the reins of party activity come together eventually in the hands of Mus-

solini. All nominations are traceable directly or indirectly to him, and throughout the varied ramifications of the party machine the will of the leaders as a general rule prevails over the component organs. Mussolini controls the decisions in the Great Fascist Council; the secretaries of the provincial and local associations control the activities as well as the membership of the governing bodies. It is a consequence of the aristocratic concept of the élite—as well as an expression of the contempt for the democratic principle of election—that the selection of leaders all along the line takes place through nomination from above. The party hierarchy does not proceed upward from the will of individual voters—not even theoretically, as is the case in Russia—but has its origin among the leaders, whence it permeates downward. An inevitable corollary of this authoritarian hierarchic structure is the unqualified duty of obedience incumbent upon all members. Every individual who wishes to enter the ranks of the Fascists must take an oath which binds him “to obey without question the commands of the Duce . . . and when necessary to shed his blood for the Fascist revolution.” Thus the political structure of the party must be visualized in order to understand the transformation of the Italian state as a result of the Italian revolution.

After the march to Rome and especially after the incisive legislation accompanying the establishment of the “intensified” dictatorship of 1925, Italy must be regarded as a one-party state just as Soviet Russia is a one-party state. The process of fusion of party and state was accomplished in various ways. On the one side the state itself was well adapted to the structure of a hierarchic authoritarian party. The executive power of the state became so strong both in content and in structure that it completely overshadowed the legislative and passed over into the newly created *capo del governo*, Mussolini. The complement of this process was the centralization of the entire administration, which although not carried out at one stroke ultimately eliminated local autonomy in province and community. A second means of fusion was through the constitutional overlapping of party and state. The beginning of this evolution was made when Mussolini proclaimed himself head of the party and at the same time president of the ministry. Further important steps in this direction were the amalgamation of the party militia into the state guard, court recognition of Fascist unions and administration by government appointees of

the youth organizations founded by Fascism. The conclusion of the development was reached in the constitutional erection of the Great Fascist Council, a body which first assembled for the solution of actual questions on the eve of the march to Rome and which was afterward perpetuated as the highest corporate organ of the party. Its manifold competences—such as its noteworthy collaboration in the founding of the second chamber, its expressions of opinion regarding such constitutional questions as the succession to the throne—are overshadowed from a political point of view by that particular one according to which in case of the death of Mussolini it is to submit to the monarch the nomination of his successor. Since the nominee will become equally *capo di stato e duce del fascismo*, the central function of the council may be defined as the perpetuation of the party-state regime beyond the lifetime of Mussolini.

According to Fascist theory the corporative, or guild, state is the visible expression of the supremacy of the state over the economic and social groups within the nation. The nature of this complex structure does not lend itself to brief analysis. The problem is made even more difficult by the fact that the corporative state is still in process of gradual transformation as well as by the impossibility of forming as yet an exact opinion as to how far the legal machinery set up for its realization has altered the actual features of the Italian economic system.

It is significant for an understanding of the corporative state that through it the state administration allies itself with private enterprise and the preservation of the capitalistic order. The former is declared to be the "most practicable and feasible means for serving national interests"; the latter, the best adapted "method of production." In striking contrast to the *laissez faire* doctrines of economic liberalism, Fascism sets forth—most explicitly in article IX of the *Carta del lavoro*, the basic labor constitution of the movement—the right of the state to intervene in the process of production whenever private initiative is unequal to the task at hand or when political interests are at stake. Although of course an emergency administration of inadequately cultivated landed property has hitherto taken place only seldom, an interventionist policy has manifested itself in the limitations on free choice of domicile with a view to restricting the supply of industrial labor, in the discouragement of new factories in large cities and in the decisive state regulation of small merchants.

The most thoroughgoing interventionism of the corporative state is in regard to the freedom of labor. A syndicalist structure incorporating the various vocations of the nation is designed to regulate all relationships involving labor. Although this is accompanied by a campaign of moral and national education among the members the regulations are rigidly binding upon all. Consistent with the emphasis on the supremacy of the state is the effort to transcend the disastrous economic and political effects of class conflict by emphasizing the solidarity of capital and labor in the production process. Actually of course there is still a sharp division between labor associations and employers' associations, leaving the way open to a clash of interests. But since all strikes and lockouts are outlawed, such disputes are to be settled only by arbitration groups or in the last resort by the state *magistrature del lavoro*. According to the labor constitution wages should be determined by three considerations—not always easy to establish—the necessities of life, the potentiality of production and the profits of labor. The critical point in the development of the corporative state is whether the joint associations composed of both capitalists and workers—the corporations, described in article VI of the *Carta del lavoro* as "unified organizations of all productive forces"—can actually exert a wide influence in regulating the individual production processes. If this aim is accomplished, the resulting economic system would constitute an economic autonomy under state leadership, a type of plan-capitalism, with flexible state intervention always in the background—a system which is far different from the unwieldy state socialism on the German pattern.

A further analysis of the political features of the corporative state reveals that in the composition of its membership it is hierarchic, just as the party and the state are, and that in the last analysis its activities are equally inspired and directed by Mussolini. The higher associations, the confederations and federations, control and direct the lower. At the pinnacle of this broad framework are the ministry of corporations and the national council of corporations, which at the time of its inauguration was designated by Mussolini as the economic general staff of Italy.

But the corporative state does more than round out the supremacy of Fascist authoritarianism. The confederations are entrusted with the important function of drawing up a list of candidates for the second chamber, which ulti-

mately, after amendments by the Great Fascist Council, is submitted to a vote of the people. Under the institution of a "sovereign dictatorship" which controls all expressions of public opinion, the chief function of the Chamber of Deputies is to keep alive the contact between the public and the administration and in the process to disseminate and interpret for the benefit of the people the essentials of Fascist policy. And since the majority of deputies emanate from the state recognized vocational associations, the body of popular representatives is capable of providing expert support to the work of economic legislation.

In the supervision of the cultural as well as of the economic life of the state Fascism has manifested its characteristic tendency to put into circulation again currencies which since the French Revolution had been withdrawn. A typical illustration of this conservatism is the educational reform of Giovanni Gentile. His philosophy of "actualism," which has permeated Fascist political and social theory, repudiates the abstract and rational approach of Rousseau as destructive of the personality of the pupil formed by family and religious training. The development of this personality according to Socratic precept is accepted as the true goal of Fascist education, which at the same time consistently emphasizes tradition as one of the great cultural forces. "Popular tradition, so long as it remains a living force among a people which cherishes the words of its ancestors, and the great national literature, which at all times has brought forth masterpieces of poetry, and faith, and knowledge: these, for all their greatness, are accessible even to the poorest."

Fascist school legislation has made religious education obligatory in state schools. Although the relationship of Fascism to the Catholic church is in many respects extremely complicated, it is unquestionably true that the two movements share in common, to a greater degree than at any time since the Risorgimento, many features—as, for example, an antipathy to liberalism and a close contact with the middle classes, especially the agrarian. It would be a mistake, of course, to ignore the political motives which operated on both sides in the rapprochement between the Curia and the king. But it would be equally unrealistic, in considering the monopolization by the Fascists of the social life of Italy—especially of the education of the young—and the irremediable resentment of the Curia, to forget that both groups deem it from time

to time expedient to pose in the eyes of the world as bitter adversaries.

Between the foreign policy of the Fascists and that of their predecessors there is no clear cut distinction. The international relations of a state are predetermined by its geographical location, the vitality and martial virtues of its population and to a less degree by its historical traditions. A very decisive transformation in the inner structure of a country may not find its counterpart in the diplomatic sphere.

Even the methods of Fascist diplomacy reveal little change. Italian politics has hitherto been empirical and realistic and therefore unusually elastic. If at the present time it creates in foreign countries the impression of rigidity it is because in Italy there is no public opinion apart from that controlled by the dictatorship.

What has changed is the vigor with which Fascist Italy makes her diplomatic claims effective. It should not be forgotten that one reason for the rapid expansion of the Fascist movement was the feebleness of Italian foreign policy directly after the war, and in addition that every government which emphasizes so strongly the idea of nationalism and of national mission is invariably committed to a vigorous foreign policy.

Although hemmed in between the French and English holdings in the Mediterranean, Fascist Italy has succeeded by the penetration of Albania and the definitive conquest of Dodecanese in preserving and strengthening its political position in the Adriatic and the Aegean. While the attempt has been made to continue and deepen the traditional friendship with England, the relations with France have occasionally come sharply to a head. The attempted denationalization of numerous Italian settlers in Tunis, the political and economic influence of both powers in southeastern Europe, the difficult problem of naval armaments, have proved the most dangerous points in which the Franco-Italian rivalry has kindled during the last few years. Undoubtedly the position of Italy as a great power and its diplomatic self-dependence have been strengthened under the Fascist government. For the fate of Europe the most critical consideration is whether the Fascist regime in the pursuit of its national aspirations will be successful in reconciling the internal strain caused by its political and national ideology with a peaceful foreign policy.

FASHION. The meaning of the term fashion may be clarified by pointing out how it differs in connotation from a number of other terms whose meaning it approaches. A particular fashion differs from a given taste in suggesting some measure of compulsion on the part of the group as contrasted with individual choice from among a number of possibilities. A particular choice may of course be due to a blend of fashion and taste. Thus, if bright and simple colors are in fashion, one may select red as more pleasing to one's taste than yellow, although one's free taste unhampered by fashion might have decided in favor of a more subtle tone. To the discriminating person the demand of fashion constitutes a challenge to taste and suggests problems of reconciliation. But fashion is accepted by aver-

age people with little demur and is not so much reconciled with taste as substituted for it. For many people taste hardly arises at all except on the basis of a clash of an accepted fashion with a fashion that is out of date or current in some other group than one's own.

The term fashion may carry with it a tone of approval or disapproval. It is a fairly objective term whose emotional qualities depend on a context. A moralist may decry a certain type of behavior as a mere fashion but the ordinary person will not be displeased if he is accused of being in the fashion. It is different with fads, which are objectively similar to fashions but differ from them in being more personal in their application and in connoting a more or less definite social disapproval. Particular people or coteries have their fads, while fashions are the property of larger or more representative groups. A taste which asserts itself in spite of fashion and which may therefore be suspected of having something obsessive about it may be referred to as an individual fad. On the other hand, while a fad may be of very short duration, it always differs from a true fashion in having something unexpected, irresponsible or bizarre about it. Any fashion which sins against one's sense of style and one's feeling for the historical continuity of style is likely to be dismissed as a fad. There are changing fashions in tennis rackets, while the game of mah jong, once rather fashionable, takes on in retrospect more and more the character of a fad.

Just as the weakness of fashion leads to fads, so its strength comes from custom. Customs differ from fashions in being relatively permanent types of social behavior. They change, but with a less active and conscious participation of the individual in the change. Custom is the element of permanence which makes changes in fashion possible. Custom marks the highroad of human interrelationships, while fashion may be looked upon as the endless departure from and return to the highroad. The vast majority of fashions are relieved by other fashions, but occasionally a fashion crystallizes into permanent habit, taking on the character of custom.

It is not correct to think of fashion as merely a short lived innovation in custom, because many innovations in human history arise with the need for them and last as long as they are useful or convenient. If, for instance, there is a shortage of silk and it becomes customary to substitute cotton for silk in the manufacture of certain articles of dress in which silk has been

the usual material, such an enforced change of material, however important economically or aesthetically, does not in itself constitute a true change of fashion. On the other hand, if cotton is substituted for silk out of free choice as a symbol perhaps of the simple life or because of a desire to see what novel effect can be produced in accepted types of dress with simpler materials, the change may be called one of fashion. There is nothing to prevent an innovation from eventually taking on the character of a new fashion. If, for example, people persist in using the cotton material even after silk has once more become available, a new fashion has arisen.

Fashion is custom in the guise of departure from custom. Most normal individuals consciously or unconsciously have the itch to break away in some measure from a too literal loyalty to accepted custom. They are not fundamentally in revolt from custom but they wish somehow to legitimize their personal deviation without laying themselves open to the charge of insensitiveness to good taste or good manners. Fashion is the discreet solution of the subtle conflict. The slight changes from the established in dress or other forms of behavior seem for the moment to give the victory to the individual, while the fact that one's fellows revolt in the same direction gives one a feeling of adventurous safety. The personal note which is at the hidden core of fashion becomes superpersonalized.

Whether fashion is felt as a sort of socially legitimized caprice or is merely a new and unintelligible form of social tyranny depends on the individual or class. It is probable that those most concerned with the setting and testing of fashions are the individuals who realize most keenly the problem of reconciling individual freedom with social conformity which is implicit in the very fact of fashion. It is perhaps not too much to say that most people are at least partly sensitive to this aspect of fashion and are secretly grateful for it. A large minority of people, however, are insensitive to the psychological complexity of fashion and submit to it to the extent that they do merely because they realize that not to fall in with it would be to declare themselves members of a past generation or dull people who cannot keep up with their neighbors. These latter reasons for being fashionable are secondary; they are sullen surrenders to bastard custom.

The fundamental drives leading to the creation and acceptance of fashion can be isolated. In the more sophisticated societies boredom,

created by leisure and too highly specialized forms of activity, leads to restlessness and curiosity. This general desire to escape from the trammels of a too regularized existence is powerfully reenforced by a ceaseless desire to add to the attractiveness of the self and all other objects of love and friendship. It is precisely in functionally powerful societies that the individual's ego is constantly being convicted of helplessness. The individual tends to be unconsciously thrown back on himself and demands more and more novel affirmations of his effective reality. The endless rediscovery of the self in a series of petty truanancies from the official socialized self becomes a mild obsession of the normal individual in any society in which the individual has ceased to be a measure of the society itself. There is, however, always the danger of too great a departure from the recognized symbols of the individual, because his identity is likely to be destroyed. That is why insensitive people, anxious to be literally in the fashion, so often overreach themselves and nullify the very purpose of fashion. Good hearted women of middle age generally fail in the art of being ravishing nymphs.

Somewhat different from the affirmation of the libidinal self is the more vulgar desire for prestige or notoriety, satisfied by changes in fashion. In this category belongs fashion as an outward emblem of personal distinction or of membership in some group to which distinction is ascribed. The imitation of fashion by people who belong to circles removed from those which set the fashion has the function of bridging the gap between a social class and the class next above it. The logical result of the acceptance of a fashion by all members of society is the disappearance of the kinds of satisfaction responsible for the change of fashion in the first place. A new fashion becomes psychologically necessary, and thus the cycle of fashion is endlessly repeated.

Fashion is emphatically a historical concept. A specific fashion is utterly unintelligible if lifted out of its place in a sequence of forms. It is exceedingly dangerous to rationalize or in any other way psychologize a particular fashion on the basis of general principles which might be considered applicable to the class of forms of which it seems to be an example. It is utterly vain, for instance, to explain particular forms of dress or types of cosmetics or methods of wearing the hair without a preliminary historical critique. Bare legs among modern women in

summer do not psychologically or historically create at all the same fashion as bare legs and bare feet among primitives living in the tropics. The importance of understanding fashion historically should be obvious enough when it is recognized that the very essence of fashion is that it be valued as a variation in an understood sequence, as a departure from the immediately preceding mode.

Changes in fashion depend on the prevailing culture and on the social ideals which inform it. Under the apparently placid surface of culture there are always powerful psychological drifts of which fashion is quick to catch the direction. In a democratic society, for instance, if there is an unacknowledged drift toward class distinctions fashion will discover endless ways of giving it visible form. Criticism can always be met by the insincere defense that fashion is merely fashion and need not be taken seriously. If in a puritanic society there is a growing impatience with the outward forms of modesty, fashion finds it easy to minister to the demands of sex curiosity, while the old mores can be trusted to defend fashion with an affectation of unawareness of what fashion is driving at. A complete study of the history of fashion would undoubtedly throw much light on the ups and downs of sentiment and attitude at various periods of civilization. However, fashion never permanently outruns discretion and only those who are taken in by the superficial rationalizations of fashion are surprised by the frequent changes of face in its history. That there was destined to be a lengthening of women's skirts after they had become short enough was obvious from the outset to all except those who do not believe that sex symbolism is a real factor in human behavior.

The chief difficulty of understanding fashion in its apparent vagaries is the lack of exact knowledge of the unconscious symbolisms attaching to forms, colors, textures, postures and other expressive elements in a given culture. The difficulty is appreciably increased by the fact that the same expressive elements tend to have quite different symbolic references in different areas. Gothic type, for instance, is a nationalistic token in Germany, while in Anglo-Saxon culture the practically identical type known as Old English has entirely different connotations. In other words, the same style of lettering may symbolize either an undying hatred of France or a wistful look backward at madrigals and pewter.

An important principle in the history of fash-

ion is that those features of fashion which do not configure correctly with the unconscious system of meanings characteristic of the given culture are relatively insecure. Extremes of style, which too frankly symbolize the current of feeling of the moment, are likely to find themselves in exposed positions, as it were, where they can be outflanked by meanings which they do not wish to recognize. Thus, it may be conjectured that lipstick is less secure in American culture as an element of fashion than rouge discreetly applied to the cheek. This is assuredly not due to a superior sinfulness of lipstick as such, but to the fact that rosy cheeks resulting from a healthy natural life in the country are one of the characteristic fetishisms of the traditional ideal of feminine beauty, while lipstick has rather the character of certain exotic ardors and goes with flaming oriental stuffs. Rouge is likely to last for many decades or centuries because there is, and is likely to be for a long time to come, a definite strain of nature worship in our culture. If lipstick is to remain it can only be because our culture will have taken on certain violently new meanings which are not at all obvious at the present time. As a symbol it is episodic rather than a part of the underlying rhythm of the history of our fashions.

In custom bound cultures, such as are characteristic of the primitive world, there are slow non-reversible changes of style rather than the often reversible forms of fashion found in modern cultures. The emphasis in such societies is on the group and the sanctity of tradition rather than on individual expression, which tends to be entirely unconscious. In the great cultures of the Orient and in ancient and mediaeval Europe changes in fashion can be noted radiating from certain definite centers of sophisticated culture, but it is not until modern Europe is reached that the familiar merry-go-round of fashion with its rapid alternations of season occurs.

The typically modern acceleration of changes in fashion may be ascribed to the influence of the Renaissance, which awakened a desire for innovation and which powerfully extended for European society the total world of possible choices. During this period Italian culture came to be the arbiter of taste, to be followed by French culture, which may still be looked upon as the most powerful influence in the creation and distribution of fashions. But more important than the Renaissance in the history of fashion is the effect of the industrial revolution and the rise of the common people. The former in-

creased the mechanical ease with which fashions could be diffused; the latter greatly increased the number of those willing and able to be fashionable.

Modern fashion tends to spread to all classes of society. As fashion has always tended to be a symbol of membership in a particular social class and as human beings have always felt the urge to edge a little closer to a class considered superior to their own, there must always have been the tendency for fashion to be adopted by circles which had a lower status than the group setting the fashions. But on the whole such adoption of fashion from above tended to be discreet because of the great importance attached to the maintenance of social classes. What has happened in the modern world, regardless of the official forms of government which prevail in the different nations, is that the tone giving power which lies back of fashion has largely slipped away from the aristocracy of rank to the aristocracy of wealth. This means a psychological if not an economic leveling of classes because of the feeling that wealth is an accidental or accreted quality of an individual as contrasted with blood. In an aristocracy of wealth everyone, even the poorest, is potentially wealthy both in legal theory and in private fancy. In such a society, therefore, all individuals are equally entitled, it is felt, so far as their pockets permit, to the insignia of fashion. This universalizing of fashion necessarily cheapens its value in the specific case and forces an abnormally rapid change of fashion. The only effective protection possessed by the wealthy in the world of fashion is the insistence on expensive materials in which fashion is to express itself. Too great an insistence on this factor, however, is the hall mark of wealthy vulgarity, for fashion is essentially a thing of forms and symbols not of material values.

Perhaps the most important of the special factors which encourage the spread of fashion today is the increased facility for the production and transportation of goods and for communication either personally or by correspondence from the centers of fashion to the outmost periphery of the civilized world. These increased facilities necessarily lead to huge capital investments in the manufacture and distribution of fashionable wear. The extraordinarily high initial profits to be derived from fashion and the relatively rapid tapering off of profits make it inevitable that the natural tendency to change in fashion is helped along by commercial suggestion. The increas-

ingly varied activities of modern life also give greater opportunity for the growth and change of fashion. Today the cut of a dress or the shape of a hat stands ready to symbolize anything from mountain climbing or military efficiency through automobiling to interpretative dancing and veiled harlotry. No individual is merely what his social role indicates that he is to be or may vary only slightly from, but he may act as if he is anything else that individual phantasy may dictate. The greater leisure and spending power of the bourgeoisie, bringing them externally nearer the upper classes of former days, are other obvious stimuli to change in fashion, as are the gradual psychological and economic liberation of women and the greater opportunity given them for experimentation in dress and adornment.

Fashions for women show greater variability than fashions for men in contemporary civilization. Not only do women's fashions change more rapidly and completely but the total gamut of allowed forms is greater for women than for men. In times past and in other cultures, however, men's fashions show a greater exuberance than women's. Much that used to be ascribed to woman as female is really due to woman as a sociologically and economically defined class. Woman as a distinctive theme for fashion may be explained in terms of the social psychology of the present civilization. She is the one who pleases by being what she is and looking as she does rather than by doing what she does. Whether biology or history is primarily responsible for this need not be decided. Woman has been the kept partner in marriage and has had to prove her desirability by ceaselessly reaffirming her attractiveness as symbolized by novelty of fashion. Among the wealthier classes and by imitation also among the less wealthy, woman has come to be looked upon as an expensive luxury on whom one spends extravagantly. She is thus a symbol of the social and economic status of her husband. Whether with the increasingly marked change of woman's place in society the factors which emphasize extravagance in women's fashions will entirely fall away it is impossible to say at the present time.

There are powerful vested interests involved in changes of fashions, as has already been mentioned. The effect on the producer of fashions of a variability which he both encourages and dreads is the introduction of the element of risk. It is a popular error to assume that professional designers arbitrarily dictate fashion. They do so

only in a very superficial sense. Actually they have to obey many masters. Their designs must above all things net the manufacturers a profit, so that behind the more strictly psychological determinants of fashion there lurks a very important element due to the sheer technology of the manufacturing process or the availability of a certain type of material. In addition to this the designer must have a sure feeling for the established in custom and the degree to which he can safely depart from it. He must intuitively divine what people want before they are quite aware of it themselves. His business is not so much to impose fashion as to coax people to accept what they have themselves unconsciously suggested. This causes the profits of fashion production to be out of all proportion to the actual cost of manufacturing fashionable goods. The producer and his designer assistant capitalize the curiosity and vanity of their customers but they must also be protected against the losses of a risky business. Those who are familiar with the history of fashion are emphatic in speaking of the inability of business to combat the fashion trends which have been set going by various psychological factors. A fashion may be aesthetically pleasing in the abstract, but if it runs counter to the trend or does not help to usher in a new trend which is struggling for a hearing it may be a flat failure.

The distribution of fashions is a comparatively simple and automatic process. The vogue of fashion plates and fashion magazines, the many lines of communication which connect fashion producers and fashion dispensers, and modern methods of marketing make it almost inevitable that a successful Parisian fashion should find its way within an incredibly short period of time to Chicago and San Francisco. If it were not for the necessity of exploiting accumulated stocks of goods these fashions would penetrate into the remotest corners of rural America even more rapidly than is the case. The average consumer is chronically distressed to discover how rapidly his accumulated property in wear depreciates by becoming outmoded. He complains bitterly and ridicules the new fashions when they appear. In the end he succumbs, a victim to symbolisms of behavior which he does not fully comprehend. What he will never admit is that he is more the creator than the victim of his difficulties.

Fashion has always had vain critics. It has been arraigned by the clergy and by social satirists because each new style of wear, calling

attention as it does to the form of the human body, seems to the critics to be an attack on modesty. Some fashions there are, to be sure, whose very purpose it is to attack modesty, but over and above specific attacks there is felt to be a generalized one. The charge is well founded but useless. Human beings do not wish to be modest; they want to be as expressive—that is, as immodest—as fear allows; fashion helps them solve their paradoxical problem. The charge of economic waste which is often leveled against fashion has had little or no effect on the public mind. Waste seems to be of no concern where values are to be considered, particularly when these values are both egoistic and unconscious. The criticism that fashion imposes an unwanted uniformity is not as sound as it appears to be in the first instance. The individual in society is only rarely significantly expressive in his own right. For the vast majority of human beings the choice lies between unchanging custom and the legitimate caprice of custom, which is fashion.

Fashion concerns itself closely and intimately with the ego. Hence its proper field is dress and adornment. There are other symbols of the ego, however, which are not as close to the body as these but which are almost equally subject to the psychological laws of fashion. Among them are objects of utility, amusements and furniture. People differ in their sensitiveness to changing fashions in these more remote forms of human expressiveness. It is therefore impossible to say categorically just what the possible range of fashion is. However, in regard to both amusements and furniture there may be observed the same tendency to change, periodicity and unquestioning acceptance as in dress and ornament.

Many speak of fashions in thought, art, habits of living and morals. It is superficial to dismiss such locutions as metaphorical and unimportant. The usage shows a true intuition of the meaning of fashion, which while it is primarily applied to dress and the exhibition of the human body is not essentially concerned with the fact of dress or ornament but with its symbolism. There is nothing to prevent a thought, a type of morality or an art form from being the psychological equivalent of a costuming of the ego. Certainly one may allow oneself to be converted to Catholicism or Christian Science in exactly the same spirit in which one invests in pewter or follows the latest Parisian models in dress. Beliefs and attitudes are not fashions in their character of mores but neither are dress and orna-

ment. In contemporary society it is not a fashion that men wear trousers; it is the custom. Fashion merely dictates such variations as whether trousers are to be so or so long, what colors they are to have and whether they are to have cuffs or not. In the same way, while adherence to a religious faith is not in itself a fashion, as soon as the individual feels that he can pass easily, out of personal choice, from one belief to another, not because he is led to his choice by necessity but because of a desire to accrete to himself symbols of status, it becomes legitimate to speak of his change of attitude as a change of fashion. Functional irrelevance as contrasted with symbolic significance for the expressiveness of the ego is implicit in all fashion.

FASTING is a reduction in the quantity of food taken, even to total abstinence. It must not be confused with the avoidance of certain victuals as being harmful, as when a Fijian mother avoids rich food for fear her child might contract a disease. Such an act is on a par with the avoidance of sugar by a modern patient with diabetes and is dieting, not fasting. Neither should fasting be confused with food tabus, such as the Jewish tabu on pork, the food tabus of Polynesian chiefs and the vegetarianism of the high caste Hindus.

True fasting is one of the most common incidents of ceremonies which are designated by the terms sacrament, sacrifice and consecration. It is invariably the prelude to such ceremonies. Thus by fasting the king prepares for his installation, the priest for his ordination, the knight for his knighthood, the initiate for his initiation, the neophyte for baptism, the communicant for the mass, the bride and bridegroom for marriage and the adolescent girl for the new life ushered in by her first menses. These are ceremonies that enact death and rebirth or are derived from such ceremonies. They begin with a period of quiescence, which appears to represent the state of non-existence preceding conception. Fasting is merely a part of this quiescence; all activities are suspended as far as is physically possible. This view is borne out by the fact that fasting is common after a death, when the mourners undergo fictitious death in sympathy with the deceased (*I Samuel* xxxi: 13; *I Chronicles* x: 12).

Rebirth is not limited to persons but extends to things. Nature has at intervals to be renovated in whole or part. These ceremonies of renovation occur when special circumstances arise, such as droughts, excessive rain, settlement in a new home and renewal of sacred things. Some are seasonal, occurring at the vernal and autumnal equinoxes. Fasting precedes the building of a new temple and the issue of a new code (*Exodus* xxxiv), a visit to a temple (*Herodotus* ii: 40), the making of a new fire and rain making. Fasting is observed in the Solomon Islands by a man who crosses the sea for the first time, for he is apt to lose his soul and a new one has to be provided on his return (Ivens, W. G., *Island Builders of the Pacific*, Philadelphia 1930, p. 231-35). Seasonal fasting occurs at sowing time (Thesmophoria at Athens), on planting a new garden (Solomon Islands) and before harvest time. The fasting that precedes the rebirth of nature after winter survives in the substitution of unleavened for leavened bread during the Passover week among the Jews, the thirty days' Ramadan among the Mohammedans and the forty days' Lent in the Christian church. It has been reinterpreted in accordance with the ethics or theology of these religions, as in the case of Lent, which has attached itself to the death and resurrection of Christ. Such prolonged fasts cannot be complete but are often observed by day only. This is the Mohammedan practise and was the Christian until the twelfth century. It can be traced back to the Hebrews (*Judges* xx: 26; *I Samuel* xiv: 24) and explains

Fashion — Fasting

the long fastings ascribed to Moses and others (*I Kings* xix: 8). Fijians fast by day after the death of a chief probably because the mourners identify themselves with the spirits of the underworld, whose night is day. The great seasonal fasts being associated with the death of the god are accompanied by similar inversion.

Since fasting is a necessary introduction to ceremonies which aim at fertility it becomes directly associated with the power to produce crops and progeny. Thus fasting by itself is held to be conducive to rain as a condition of fertility. Fasting and austerities in India have supplanted the ritual to which they were originally the preface and afford power over the gods by whom prosperity is given. The technique of fasting has been developed there to an extent unknown elsewhere. Refinements have been invented and classified under technical terms, such as specific designations for reducing full diet by degrees to nothing and for the practise of increasing daily from complete abstinence to full diet. Hindu ascetics by going into a trance can fast for incredibly long periods, a practise which has not yet been scientifically investigated.

The same process by which fasting became associated with the control of nature also connects it with sin. Renovation ceremonies are undertaken when the weather has been upset by moral lapses; thus Indian legend tells of a twelve-year drought caused by the usurpation of the throne by a younger brother. Similar interpretations of droughts are found in the Old Testament. Fasting acquires the character of a penance as part of a process which removes the sin, an association which is facilitated by the loss of appetite which fear and regret automatically produce and the loss of spirits consequent on fasting. The idea of penance became strongly attached to fasting among the Jews but more so among the Christians. In the Old Testament penitential fasting retained some of its original character as part of a fictitious death; it is done in "sackcloth and ashes" and is described as mourning (*Daniel* ix: 3). The prophets in accordance with their ethical bias insisted on a penitent state of mind (*Joel* ii: 12-13). In the Christian church penance is stressed as all important. Fasting is also brought through association into direct relation with rebirth. Tertullian said that Christ when fasting "was initiating the new man" into a "severe handling of the old" and that fasts were to be the weapons for battling with the more direful demons.

In all these ways fasting has been modified

from its original significance and has acquired new associations which offer a favorable condition for reinterpretation. St. Augustine justified the fast before Communion on grounds of precedence. An objection has also arisen to mingling the sacrament with gross food, which has led to displacement. Charlemagne enjoined fasting for two or three hours after Communion, a change which did not take root because the introductory character of fasting is too strongly impressed by tradition and psychologically suits the preference for working up to a climax. An attempt was made by the Church of England to justify fasting in regard to abstinence from meat as benefiting the fishing and shipping trades; but utilitarianism is not sufficient inducement for the enforcement of fasting.

Reinterpretations modify practise. For instance, it is thought by some that penance can be achieved if only one abstains from certain appetizing victuals. Rigorous fasting which is difficult or even dangerous ceases to be absolutely necessary. This selective fasting comes to bear a superficial resemblance to food tabus with which it originally had no connection. Thus Tertullian confused the Jewish tabu on pork with fasting, arguing that when the Israelites came out of Egypt "certain things were prohibited as unclean, in order that man, by observing a perpetual abstinence in certain particulars, might at last the more easily tolerate absolute fasts" (*De jejuniis*, ch. v). Selective fasting was known to the author of *Daniel* (x: 3). The early Christian church witnessed a great many varieties: xerophagists abstained from all juicy and moistened food; in the fifth century some, probably under Indian influence, abstained from things that had life; others ate fish only, others fowl as well; and others no eggs or fruit. Out of this chaos the Roman church gradually evolved uniformity varied by local custom and has generally accepted the distinction between meat and fish. Thomas Aquinas justified this distinction on the ground that fish excites the passions less than meat. In the Church of England fasting is in abeyance except in the High Church party, where it is sometimes reduced to the renunciation of some particular indulgence.

Fasting provokes conflict between will and appetite. Selective fasting gives the subconscious continual opportunities to assert itself by violating the spirit while observing the letter. Thus in some countries Good Friday, which is the most obligatory fast, has become an occasion for epicurean fish dinners. Theology is perpet-

ually striving to maintain the reality of the fast, which the appetites are striving to circumvent; this results in casuistry and a host of minute regulations, such as those stating that a drink of water does not break the fast and that wine does if taken for pleasure but not if taken to quench thirst. The hour at which food can be taken has gradually been placed earlier in the day; small collations have been allowed not to count. The present practise of the Roman Catholic church is defined: "The ecclesiastical fast consists in the abstinence from food and certain kinds of food, which is observed in the manner prescribed by the Church. . . . The ecclesiastical fast consists, as it were, of three parts, to wit, 1) a single meal in twenty-four hours with the addition of a small evening collation; 2) abstinence from flesh and milky foods; 3) limiting the time for taking food" (Gury, J. P., *Compendium theologiae moralis*, 2 vols., Rome 1880; vol. i, pt. ii, *praeceptus ecclesiae* 6). Under the heading of flesh come all animals "living and breathing on earth"; therefore such animals as fish, frogs, snails and turtles are not forbidden. These principles are interpreted with wide latitude. "The Church has only one aim in the discipline of fasting, that of helping us the better to practice the law of God and to progress in a Christian life. If it happens by accident that the observance of fasting, far from serving that end, impedes it . . . it ceases to be binding" (Thouvenin, A., "Jeûne" in *Dictionnaire de théologie catholique*, vol. viii, 1924, cols. 1411-17). Thus if fasting prevents a person from carrying out his work efficiently it must be dispensed with and none but the leisured are bound to fast. The Buddhist church has experienced the same conflict but has decreased the daily afternoon fast of the priests only to the extent of not counting condiments as food.

The decay of fasting corresponds with the loss of its usefulness. It has undoubtedly played a useful part in building up self-control. To realize this one must consider that the children of many less civilized races are subject to little discipline and are much indulged. The fast imposed by the ritual demands a degree of self-control to which they are little accustomed and which proves its value in war and on similar occasions. It may produce a self-satisfaction through the self-control derived from it which may become a motive for fasting and which has become associated with the name of Pharisee (*Luke* XVIII: 10-12; *Isaiah* LVIII).

As societies advance the tendency is toward

excessive regulation of life so that any superfluous exercises in self-control add to the burden of repression and are discarded. At the same time certain psychological types tend to exaggerate practises of self-repression. The phenomenon called by Freudians "transference from below upwards" doubtless plays a part in fasting, as sex and eating are connected psychologically. The proximity of the stomach to the anus induces a feeling of disgust in introspective minds. Tertullian for example described man as "stuffed with meats . . . fermenting for the purpose of excremental secretion" (*De jejuniis*, ch. vi). Similar views are expressed in Buddhist writings.

Unpleasant as fasting may be when first practised, carried beyond a certain point it produces pleasant sensations of mental activity, lightness and supersensuality, for the sake of which it may be cultivated. Mysticism interprets this as a liberation from the flesh and drawing near to God. Comparable to this is the practise of fasting for the purpose of inducing visions during the quest for guardian spirits by North American Indians.

FATALISM is the belief that underlying the events of nature and human life there is an inscrutable and relentless necessity. It is found in early cultures as an unsophisticated acknowl-

edgment, emotionally grounded, that man's desires are involved in a universe which outruns his powers to understand or to control. In this conception the working of fate was not that of an all inclusive mechanism. It was rather the somber, dreadful phase of chance corresponding to the favorable phase of luck or fortune. When in later cultures an ultimate, all ruling fate was enthroned the somber quality remained: fate was ruthless and from man's point of view irrational. In doctrines of predestination theistic religions softened the ruthless quality by subsuming the fact of inevitable necessity under the will of God, whose plan also included the fulfilment of the highest hopes of man. Necessity thus remained, but in a form emotionally acceptable. Scientific philosophies of determinism removed the irrational aspect of fate by interpreting necessity in terms of ordered sequences of cause and effect which included in the causal chain the desires and decisions of men. Within all these systems, however, as in all absolutisms, theistic or impersonal, there is the essential quality of fatalism rationalized and refined.

The idea of fate is probably rooted psychologically in the fact of evil and the inevitability of death. Fate loomed in early mythologies as a dark presence beside or behind the gods who were man's kindly helpers. It is not without significance that the words for fate in early cultures are so intimately connected with experiences of disaster and death. All the Indo-European peoples had the idea of a power or powers which at birth fixed the "share" of the individual in life and determined his destiny (Moirai, Parcae, Norns, etc.). The Slavs and Celts retained the idea of fate in its simplest form. The Greeks, especially the tragic poets, developed it into an inexorable power above the gods; Plato thought of it as a predetermined order and the stoics defined it as a deterministic rational system of the universe. Oracles, divination and astrology were at once practical expressions of the belief and a means of fostering it. In India the earlier ideas of fate (*kala*, *deva*) yielded to the cosmic causal law of karma which holds sway over gods and men. All forms of Hinduism—Sankhya, Vedantism, Buddhism, Jainism and the popular religions (Vaishnavism, Shaivism)—assume this determinant of destiny and build their programs of salvation on a method of breaking the causal chain which everlastingly revolves the wheel of rebirth. Through all the culture history of China also runs the idea of fate or destiny. As early

as the fifth century B.C. the philosopher Micius complains that all the "moderns" are fatalists. Chinese fatalism is grounded in the ultimate cosmic order, the *tao*, which finds practical expression in *ming* as the decree of heaven. Fate feeds on tragedy and the futility of human effort; and the age of the philosophic development of the doctrine of the *tao* was a troubled period in the history of China. Taoism does not demand a practical fatalism but it was so used by Chinese sages ancient and modern. Chucius (1130-1200), whose influence still lives in China and Japan, was frankly fatalistic. The stress placed on fatalism in orthodox Islam is unusual for a theistic religion. Usually religions which develop the idea of an absolute personal God lose the concept of fate in His all controlling will. Resignation to the will of God is substituted for acceptance of fate and functions in exactly the same way. But in most cases the logic of theism which would develop the implications of the absolute divine will is obscured by the social necessity of insistence upon responsibility and freedom. In the case of Islam, however, God's absolute will is stressed and the practical attitude finds expression in the fatalistic conception of kismet.

In strict logic the tendency of absolutes, whether in philosophy or religion, is to yield a cosy quietism in times of social stress and security in individual difficulties. This is especially true of the belief in fate, which in practise serves chiefly as a means of adjustment to irremediable conditions. Moral failure loses its power to crush, material loss becomes tolerable, if both can be attributed to a force beyond human control. In the midst of evils from which there is no escape the doctrine of karma or kismet may serve as an opiate. When danger is extreme or death imminent fatalism conveys security and consolation. For soldiers in battle fatalism yields not only splendid courage but poise and peace. This was the service of Zen Buddhism to the samurai of old Japan and of Moslem fatalism to the soldiers of Allah. For the social process the importance of fatalism lies in the ease with which it may serve as a way of escape from responsibility for social maladjustments. Conditions of unresolved wretchedness are fertile soil for the fatalistic attitude. In many cases the anaesthesia of fatalism combines with the rigidity of long established patterns of social behavior and the interests of privileged classes to produce the quietistic resignation which results in toleration of social wrongs and incapacity for experimental change.

But the approval and resignation with which an attitude of fatalism may regard social stagnation may also be transferred to social change. Fate is blind; it gives solace, not guidance. The same fatalism that may serve to entrench autocracy or the privileged position of a caste will justify successful revolution. Heaven's decree (*ming*) was the best and sufficient authority for many changes of dynasty in ancient China. Fatalism therefore does not necessarily act as a barrier to progress. Human desires drive to their goal with little regard for fatalistic theory when the doors of opportunity are opened. So long as tools and technique for the mastery of nature are lacking, so long as there is no effective solution for the social problems of poverty, sex injustice, insanity, crime and war, the attitude of resignation—be it to fate or the will of God—is the shortest way to peace of mind. The swiftly changing Orient, however, offers convincing evidence that fatalistic ideas are not insurmountable barriers to progress when practical techniques are attained. That fatalism functioned as a method of acceptance of the *fait accompli* without prejudicing future action is further evidenced by the fact that the social group, even when the most deterministic philosophic principles were assumed, never released the individual from responsibility for moral conduct in terms of the approved code. Hinduism, stoicism, Christianity and Islam each in its own way adjusted the inescapable determinism to the demands of social morality. Even when fate was taken logically, as by the Ajivikas in India, Yang Chu in China of the fifth century B.C. and the Sufis in Islam, it was in the interest of action and courageous joy in living.

Faith in a blind and irrational fate tended to disappear in high cultures of long historic duration. The idea was usually replaced by doctrines of determinism with an absolute God or a philosophic ultimate as dictator of human destiny. In either of these traditional forms the fatalistic attitude is difficult to maintain in the modern world. The source of its vitality in the past was human helplessness in the midst of inscrutable and inescapable evils. Under the double attack of scientific knowledge and man's increasing mastery of his environment the foundations of fatalism were shaken. Science has made man at home in the universe, pointed the way to the sources and nature of social disorganization, clarified the mechanism of maladjustments and put into man's hands the instruments of control. With power to change the face of the world and

to escape the fears which troubled the prescientific centuries, man has gained confidence in his ability through intelligence to shape his own destiny. The blind faith in science and the machine which has dominated the last quarter century is an exact antithesis to the quietism of fatalism. The supernatural and mysterious elements underlying fate have vanished. Man sees himself as a changing purposive organization of desires integral with an endlessly complex flowing stream of events. Order in nature, the continuity of heredity, social controls in custom and institution, and learned patterns of response weave themselves together into a new conception of life in society. Fatalism in the old sense has small place in this scheme. The new determinisms—and they are many—are naturalistic and include man's purposive intelligence as an essential and effective element of the complex.

FATIGUE from the practical social standpoint may be defined as a decrease in human working capacity due to increased work. Attempts to increase working efficiency in factory, classroom or elsewhere soon meet with the problem of fatigue. Since the amount of work done is most easily calculated in the number of hours worked, the study of fatigue is usually based upon the

measurement of the effect upon labor of periods of work of varying length. The earliest efforts to reduce fatigue in industry concentrated upon reduction of hours. Legislation in industrial countries gradually extended from one factory industry to another limitation of the hours of employment of women and children; trade unions fought consistently for shorter hours for all.

Isolated experiments conducted in individual factories, as in the Salford iron works in 1893 and the Zeiss optical works in 1900, showed that as hours were reduced to eight per day a rise occurred in the output per hour sufficient at least to maintain the daily output. Perhaps the first scientific recognition of fatigue as a factor of general economic, psychological and medical importance was the appointment in 1913 by the British Association for the Advancement of Science of a committee to investigate fatigue from the economic standpoint. In the original report of this committee (in British Association for the Advancement of Science, *Report of the Eighty-Fifth Meeting*, London 1916, p. 283-349) an analysis of all possible causes and conditions of industrial fatigue was outlined, and many output and accident curves collected in England and America were presented to show the course of fatigue from hour to hour of the working day and from day to day of the working week. In the case of output the curves were found to differ for different types of work; but in general there was a rise from the first to the second and sometimes the third hour of each continuous working spell, which was attributed to the effect of practise, while the distinct drop from the middle hours of the spell to the fourth or fifth was taken as an index of fatigue. In the case of accidents the curve was found to be rising almost continuously throughout the spell.

The twelve-hour day and night shifts worked by men and women in British munition factories during the World War made the question of hours one of national importance, and Lloyd George, Minister of Munitions, appointed the British Health of Munition Workers Committee. Among their important reports *Memorandum*, no. 12 (1916), provided the first instalment of an investigation by Dr. H. M. Vernon, in which he showed that in some operations the reduction of scheduled hours from between 67 and 75 per week down to about 55 not only did not reduce weekly output but sometimes increased it. This was due partly to a reduction in lost time (i.e. actual hours worked came nearer to schedule)

and partly to a greatly increased hourly rate of output.

Upon the entry of the United States into the war similar investigations by the United States Public Health Service in two large plants, one working a ten-hour, the other an eight-hour day, showed that hourly output and accident curves were different for different types of work. It was found that on work requiring muscular exertion the output fell and the accidents rose far more severely than on work requiring dexterity or mere operation of machines. Experiments made with rest pauses showed that they increased daily output in the ten-hour day; and the rhythm, or regularity of repetition, of machine operations was also found to affect fatigue in that output was best maintained throughout the day wherever work could be performed in runs of very regularly repeated operations with spontaneous rest intervals between those runs.

After the war the British Health of Munition Workers Committee was transformed into the Industrial Fatigue Research Board; and although many experiments with rest pauses continued to be reported, the causes of fatigue became definitely recognized as embracing more than merely hours of work. Numerous reports have been issued on such divergent factors as the vocational selection of workers, individual differences in output and in proneness to accident, atmosphere and lighting conditions and motion study and job analysis. Although variation of the hours of labor may be the outstanding factor affecting working capacity, any or all of the conditions of production may become responsible. These conditions can be divided into those connected with the work and those connected with the worker. Under the first head would fall hours and speeding of work, the type and method of work and the physical and social working conditions, e.g. air, light, noise, industrial hygiene and safety, type of foreman, incentives, security, personnel management and so on. Under the second head fall sex and age of workers, methods of selection and training and living conditions—a factor affected mainly by the amount of the wage received.

This broader conception of the possible sources of fatigue is of great practical importance today both in industry and in the life of the community generally. While hours of labor are gradually being reduced and the type of work called for is perhaps becoming less muscular in character, it cannot be said that industry is lightening such fatigue hazards as specialization

and monotony of work, machine set speeds, noise or insecurity of employment. The intensity, or tempo, of work is certainly increasing and with growing urbanization living conditions too are adding to the industrial worker's fatigue. The mere fact that in large cities workers must on the average live further from their work automatically substitutes hours of hustle and discomfort in crowded conveyances for hours of leisure and possible recreation.

Since work is becoming more mechanized and specialized and physically less heavy, many authorities tend to stress the growing importance of mental, or psychological, as against bodily, or physiological, fatigue. This mental fatigue refers not so much to a decrease in working capacity as a decrease, conscious or unconscious, in willingness to work, ranging all the way from the active ill will of sabotage through the disgruntlement, suspicion and unrest evidenced by strikes and restriction of output down to the mere feeling of boredom, weariness, monotony or dullness. Probably the inward state of the worker which in conjunction with long hours and other external factors causes a decrease in efficiency combines both mental and physical elements in a sort of equilibrium. Deliberately or by some defense mechanism the worker tends to adapt the energy with which he works to the length and difficulty of his task. Apparently the fatigue that results physically in lowered output and increased accidents toward the end of each working day or week will normally also result in a decreased willingness to work that checks any tendency to fatigue accumulating beyond the curative power of rest and sleep. Sometimes, however, in the everyday life of the community as in the industrial world the worker cannot heed the warning of increasing unwillingness. As transport and means of communication are speeded up and urban society becomes more closely knit and complex, the life of the individual becomes specialized and standardized and must run to schedule and routine to fit in with the time table of others. Keener rivalry and competition and such stimuli as bonuses and the glare of publicity spur men on. And as the dangers of exhaustion and overfatigue increase, there is continuously less opportunity for the simple forms of recuperation that country life affords.

It is difficult to obtain a definite measure of the effects of such conditions, but it is usually held that overfatigue lowers the resistance to disease and nervous disorders; and that while

impoverishing initiative and thought mental fatigue produces a craving for artificial stimulants and narcotics. Culture also suffers, since the day's strain leaves a man too tired to appreciate anything above the level of vaudeville or the detective story. In industry the dangers, wastes and costs of fatigue even in the widest sense can be assessed more precisely. Labor turnover and lost time, whether due to physical or psychological conditions, may be added to the diminution in quantity, quality or economy of output and to the increase in accidents and sickness as possible results—and measures—of fatigue.

These results are socially costly over and above the pain and suffering often entailed. An employee on time wage loses pay whenever he loses time; one on piece wages whenever output falls. To the employer labor turnover necessitates the training of a new worker, during which time his output will be low in quality, economy and quantity; lost time or absenteeism involves disorganization and idle overheads. Occupational disease and accidents not only cause time to be lost but also involve payment of compensation and possibly a permanent loss to industry by maiming or death. Temporary sickness and ill health account for some six working days lost per employee per year; while permanent invalidism and premature old age, although they may not trouble the employer, definitely represent a cost that society has to carry. A diminished quantity of output obviously increases the employer's labor costs if payment is by time wages, and in all cases it increases the overhead cost of machinery, equipment and administrative staff not used to full capacity; to this expense poor quality or poor economy of output adds the cost of wasted raw material.

Methods of combating fatigue must necessarily take account of the conditions that have, on scientific investigation, been found responsible for it. In industry those conditions are mostly under the control of the employer; a wide variety of policies are open to him, which he can adopt separately or in combination. To avoid the more physical forms of fatigue he may reduce his total of hours, avoid overtime, introduce rest pauses or give annual holidays with pay; he may attend more closely to industrial hygiene and adjust the ventilation or noise of the plant; he may attract by higher wages and select by tests a more suitable type of employee; he may ease the strain of the work itself by motion study and the training of workers. To avoid mental fatigue and monotony the em-

ployer may allow more variety in the assignment of work, may select employees from among those impervious to monotony or may supply incentives and interests that will overcome the latent unwillingness to work. Recently the movements toward efficiency engineering, "safety first," so-called welfare, or health and recreation, work and, above all, the new science of industrial psychology have shown the way to some employers, who may rely for the actual plan of fatigue elimination either upon outside consulting experts or their own personnel management. Many employers still lag behind and minimum standards are still to be developed by the state or trade unions, if all industrial workers are to benefit by modern knowledge. In most of the advanced industrial states, however, the legal limitation of working hours, the special regulation or the employment of woman and child labor, the stringent standards of the sanitary codes and the requirement of precautions against accidents are indirect methods of dealing with some aspects of the problem of fatigue.

FAUCHER, JULIUS (1820-78), German economist and publicist. Faucher was one of the group of German economists known as the German Manchester school who in the middle of the nineteenth century under the influence of Cobden and Bastiat carried on vigorous propaganda in favor of a resolute liberal economic policy, especially in the matter of free trade. In 1846 with Prince-Smith and others he founded the first free trade club in Germany and was successively the editor of several free trade journals in Germany and in England. For a short time he assisted Cobden in the publication of free trade literature. In 1863 he started the journal of German free traders, the *Vierteljahrsschrift für Volkswirtschaftspolitik und Kulturgeschichte*, to which he contributed many articles. Faucher and his group contributed substantially toward the abolition of the many barriers that hampered the economic expansion of Germany. He was the leading spirit in the movement for a reform in urban land tenure. He held that the housing evil in the large cities was to be traced to land profiteering, which leads to the exploitation of building sites for tenement houses. The energy with which he set about improving housing conditions shows the injustice of the current opinion which charges the German Manchester school with indifference to the social problems created by industrialism.

Consult: Becker, J., *Das deutsche Manchestertum* (Karlsruhe 1907); Grambow, L., *Die deutsche Freihandelspartei zur Zeit ihrer Blüte*, Abhandlungen des staatswissenschaftlichen Seminars zu Halle a.d.S., vol. xxxviii (Jena 1903); Bechtel, H., "Die ersten Kämpfe für eine Wohnungsreform" in *Jahrbücher für Nationalökonomie und Statistik*, vol. cxxii (1924) 813-26.

FAUCHILLE, PAUL (1858–1926), French international jurist and historian. Fauchille was not a professor; attracted by history and law, he became a writer. With Pillet he founded in 1894 the *Revue générale de droit international public*, which he directed alone from 1904 until the World War and in collaboration with La Pradelle until his death. He also edited the *Recueil périodique et critique de jurisprudence* from 1890 until his death. A member of the Institute of International Law, he impressed upon it the importance of the growing problems of the law of the air. His preparation of the *Manuel des lois de la guerre maritime* (Oxford 1913) for the Institute of International Law shows his interest in international codification.

Fauchille's great work is his systematic treatise on international law. In its final form the *Traité de droit international public* (4 vols., Paris 1921–26) may be regarded as the most comprehensive work of its kind of the present generation. It is over 4000 pages in length and grew from Fauchille's revisions of the *Manuel de droit international public* (Paris 1894) of Henry Bonfils, the dean of the University of Toulouse. After the World War Fauchille extended it to four volumes, of which the first three were devoted to peace and the last one to war and neutrality. Thus not only was Bonfils' scheme of classification based upon the analogy of private law discarded, but the manual had become an independent treatise deserving to bear only Fauchille's name as author. It is a work of a wide eclecticism welcoming new ideas. The personal feeling of the author is generally shown by the grouping of the numerous quotations, which form a veritable mosaic. No other work so well mirrors the changes in international law from the period of the Hague conferences to the present. Fauchille was constantly keeping his attention fixed upon emerging new problems. In his points of view he was free from national prejudice; he had no exaggerated notions of national sovereignty; he did not regard international law as necessarily a universal science but envisaged the possibility of continental bodies of international law, for he discussed the question whether there could be said to exist an American international law. Perhaps a pessimistic note may be traced in his conception of rules of international law as those for which nations demand obedience even though they may not render it themselves.

In 1921 Fauchille, Alvarez and La Pradelle founded the Institut des Hautes Études Inter-

nationales connected with the University of Paris, which has continuously developed along the lines laid down for it: instruction in international questions given in French to students of all nations by professors of all nationalities.

A. DE GEOUFFRE DE LA PRADELLE

Other important works: *Du blocus maritime* (Paris 1882), and *La diplomatie française et la ligue des neutres de 1780 (1776–1783)* (Paris 1893), which show Fauchille's great interest in the history and problems of international maritime law; *La question juive en France sous le premier empire* (Paris 1884), and *Une chouannerie flamande au temps de l'empire, 1813–1814* (Paris 1905), which are examples of Fauchille's historical researches in the period of the First Empire; *Louis Renault* (Paris 1918), an examination of the life and work of the jurist whose disciple Fauchille was.

FAVRE, ANTOINE (Antonius Faber) (1557–1624), French jurist. Favre was born at Bourgen-Bresse, educated at the Jesuit College in Paris and studied law at the University of Turin. After a short practise as attorney he was made provincial judge and at the age of thirty became a member of the senate of Savoy. While member and later president of the senate he was employed upon numerous state missions in which he acquitted himself honorably. Whatever the reason for Favre's fame during his lifetime, he is at the present recognized as the first scientific student of interpolation in the Roman law. Employing the criteria of linguistic impossibility and historical anachronism he discovered hundreds of passages in the *Corpus juris* of Justinian in which the compilers had altered or omitted portions of the texts of the jurists of classical times (for an enumeration of these passages see Medio, A. de, in Istituto di Diritto Romano, *Bullettino*, vol. xiii, 1901, p. 208–42, and vol. xiv, 1902, p. 276–84; Baviera, G., in *Archivio giuridico*, vol. lxix, 1902, p. 398–404). Favre began his study of interpolations with his *Coniecturae*, written at the age of twenty-two, and even noted some by way of analogy in his *Codex*, a work on Savoyard law. A few jurists early noted Favre's interpolations, for example, Kaspari Schieferdecker (*Ad Antonium Fabrum*, 3 pts., Oppenheim and Frankfurt 1610–13) and Girolamo Borgia (*Investigationum iuris civilis*, 2 vols., Naples 1678), in the main unfavorably; but it is significant that the first interpolations discovered by Eisele and Gradenwitz, the earliest of the modern students in this field, were those

that Favre had noted three centuries earlier.

A. ARTHUR SCHILLER

Important works: *Coniecturae iuris civilis* (first 3 bks., Lyons 1581; 20 bks., 1605; new ed. 1661); *De erroribus pragmaticorum et interpretum iuris* (Lyons 1598, new ed. 1658); *Rationalia in pandectas* (Geneva 1604; new ed., 5 vols., Lyons 1659-63); *Iurisprudentiae papinianae scientia* (Lyons 1607, new ed. 1658); *Codex fabrianus definitionum forensium et rerum in sacro Sabaudiae senatu tractatarum* (Lyons 1606, ed. by G. F. Avet and G. Latty, Turin 1829).

A. de, *Respublica jurisconsultorum* (Naples 1731) p. 83-87.

FAWCETT, HENRY (1833-84), English economist and statesman. Accidentally blinded by his father shortly after leaving Cambridge, Fawcett nevertheless maintained his academic and political interests. He became the first paid professor of political economy at Cambridge in 1863 and remained in that position until his death. He sat as an advanced Liberal member of Parliament from 1865 to 1884, with a brief interlude in 1874 when his radical opinions shocked his original constituency. From 1880 to 1884 Fawcett was postmaster general in Gladstone's ministry.

As an economist Fawcett was not an original thinker. His *Free Trade and Protection* (London 1878, 6th ed. 1885), perhaps his most important intellectual work, was an admirably complete statement of the orthodox arguments in favor of free trade. His *Manual of Political Economy* (London 1863, 8th ed. 1907) was, except for some sections on cooperation, little more than an accurate but dull restatement of the *Principles of Political Economy* (1848) of J. S. Mill, by whom Fawcett was greatly influenced. As a teacher he failed to stimulate the study of economics at Cambridge, partly because of his imperviousness to the newer influences in economics, especially those emanating from the German historical school. Although deeply concerned with the problem of poverty, as is evident from his *The Economic Position of the British Labourer* (Cambridge, Eng. 1865) and his *Pauperism: Its Causes and Remedies* (London 1871), he feared the harmful effects of state intervention on initiative and enterprise and strenuously adhered to

the wage fund doctrine even after Mill's recantation.

As a politician Fawcett was courageous, unhesitatingly opposing his own party when its action fell short of his own liberal principles. His criticism of the Indian policy of the British government, which caused him to be known as "The Member for India," led to the appointment of commissions of investigation and to important financial reforms. His articles on Indian affairs were published under the title *Indian Finance* (London 1880). Fawcett's efforts to check the indiscriminate enclosure movement were both notable and successful. His generous impulses were also evident in his fight for the abolition of religious tests in universities, the universal extension of compulsory education and, as might be expected from the husband of Millicent Garrett Fawcett, the enlargement of the political and economic opportunities of women.

Fawcett's practical mind found considerable scope as postmaster general, and he not only improved the working conditions of his staff but also initiated administrative changes which rendered the services of the post office more readily available to the poorer classes. In particular he introduced, in the face of opposition from strong private interests, the parcel post, the cheapened telegraph and the postal money order and modified the savings bank, insurance and annuity requirements in favor of the smaller income groups.

E. M. BURNS

Consult: Stephen, Leslie, *Life of Henry Fawcett* (5th ed. London 1886).

FAWCETT, DAME MILLICENT GARRETT (1847-1929), English feminist. Dame Millicent, whose sister, Elizabeth Garrett, became the first woman doctor in England, was from childhood interested in political problems and the emancipation of women. She was influenced at an early age by J. F. D. Maurice, J. S. Mill and other philosophic radicals. In 1867 she joined one of the first women's suffrage committees and thereafter was one of the leaders of the movement. She and her husband, Henry Fawcett, a professor and member of Parliament, also supported higher education for women and were instrumental in the founding of Newnham College, Cambridge.

Dame Millicent spoke all over the country for women's suffrage and wrote many articles and books, among them *Political Economy for Beginners* (London 1870, 9th ed. 1904). In 1897

she became president of the National Union of Women's Suffrage Societies, an organization uniting the various groups hitherto functioning separately. Militant tactics appeared in 1906 but Dame Millicent remained leader of the non-militant constitutional forces. Under her leadership their ranks expanded rapidly and by August, 1914, the agitation had reached phenomenal proportions. During the war suffrage activities were suspended but the National Union used its strong organization to facilitate women's participation in war work. Dame Millicent wrote, "Let us prove ourselves worthy of citizenship whether our claim is recognized or not," and her advice showed not only sincerity but also the utmost political wisdom, for when the urgent question of wartime franchise came before Parliament the women once more pressed their claims and the first women's suffrage bill was passed in 1918. The following year Dame Millicent resigned from active participation in the movement. Throughout her long life she was one of the most respected figures in English public life.

FEBRONIUS, JUSTINUS. *See* HONTHEIM, JOHANN NIKOLAUS VON.

FECHNER, GUSTAV THEODOR (1801-87), German physicist and founder of psychophysics. Although he made significant original contributions to physical science he is chiefly famous for his struggle to reconcile his belief in exact science with his equally earnest conviction that exact methods were failing to grasp the nature of life and mind. He undertook to solve the great dilemma by devising methods of studying the relations between the magnitudes of physical stimuli and the intensities of psychic responses. The decade 1850-60 was spent in elaborate research with many experimental and mathematical devices culminating in the publication of *Elemente der Psychophysik* (2 vols., Leipzig 1860). His conviction that he had succeeded in stating the quantitative relation between the objective and subjective worlds ($S = c \log R$, or "intensity of sensation equals a constant times the logarithm of the stimulus") has universally failed to win assent; but his careful experimental methods were taken over by G. E. Müller and Wundt as a part of the new experimental psychology which

sought to study the variation of mental responses in relation to objectively controlled and measured stimuli. Fechner's genius also profoundly influenced Ebbinghaus, the founder of quantitative method in the study of memory. In fact, no single individual did more to show the possibilities of experimental and quantitative method in psychology. In his old age Fechner published an important introduction to experimental aesthetics, *Vorschule der Ästhetik* (2 vols., Leipzig 1876; 2nd ed. 1897-98).

(New York 1901-05) vol. ii, pt. ii, p. xx-cxvi.

FEDERAL RESERVE SYSTEM is the customary designation of the present system of central cooperative banking in the United States. It includes the Federal Reserve Board at Washington, a central body of supervision and control, twelve Federal Reserve Banks, which at the end of 1930 had twenty-five domestic branches, one domestic agency and one foreign agency (in Havana), and a large number of member banks; at the end of 1930 the membership of the system comprised 7033 national banks and 1019 state chartered banks and trust companies.

The national banking system which preceded the Federal Reserve had never since its inception in 1863 furnished altogether satisfactory service; and as it grew older it proved less and less efficient, particularly in times of special strain. During the late eighties "inelasticity of the currency" became a standard criticism of the system of national banks and national banknotes. Since inelasticity was usually traced to the high price of government bonds which the banks were required by law to buy before receiving their supplies of note currency, the restoration of an "asset currency" was increasingly urged as a remedy. During the panic of 1893 the inadequacy of the national banknotes became more obvious than ever. Clearing house currency certificates were used temporarily to relieve conditions, and after the panic was over various projects of reform based on asset currency principles came prominently to the front. In order to overcome objections to a pure asset

plan the demand for asset currency was converted by some propagandists into a call for "emergency currency."

Among the projects of reform the best known was probably the Baltimore Plan, strongly urged at the Baltimore meeting of the American Bankers' Association in the autumn of 1893 and founded upon a modification of the Canadian system of guaranteed note issues. Several variants of the Baltimore Plan shortly appeared, but the movement for a better paper currency was obscured by the growing agitation for the unlimited coinage of silver which constituted the staple of controversy in the presidential campaign of 1896. During the years 1897 and 1898 the monetary commission, appointed by the Indianapolis Currency Convention, which represented business interests (particularly banking) from various sections of the country, revived the project for an asset currency. But the bill drafted by it was thrown into the background by the outbreak of the Spanish American War, which deferred remedial action until 1900. In that year a small group of Republican leaders, anticipating a renewed contest for the presidency, drafted and pushed through Congress the Gold Standard Act. This statute was largely devoted to monetary problems, but it also provided the beginning of a treatment of the banking issue by lowering the minimum capitalization of national banks, refunding the outstanding bonds into 2 percent consols, thereby rendering national banknotes cheaper in issue, and making a few other changes designed to render bank credit easier and more abundant.

Conditions in trade and industry improved after 1900, but the banking situation was hardly better during the next five years. Bond retirements soon caused a renewed scarcity of currency, and when the panic of 1907 broke out the closing of various financial institutions, which might have been saved had there been a suitable provision for credit currency, emphasized the banking and credit breakdown as an important factor in the crisis.

The experience of 1907 made obvious the necessity of some thoroughgoing treatment of the banking problem and broadened the popular issue from currency reform to banking reform. There was a recognition wider than ever before of the necessity of welding the banking system into a unit and of finding some acceptable way of protecting the gold reserves of the country through money market safeguards. It was becoming obvious that these objects could

be attained only through the mechanism of central banking, which had been so long desired and so unpopular politically in the United States. The younger school of economists had been urging a return to central banking for some years; the practical applications of this general principle had been developed in academic discussion as well as in proposed bills, some of which were later introduced in Congress. Among these should be mentioned the Mühleman bill of 1909 and the various proposals of Charles N. Fowler, chairman of the Banking and Currency Committee of the House, which culminated in the very elaborate bill of 1910. None of these bills, however, received serious consideration or was regarded as more than tentative.

The panic of 1907 also forced upon Congress the necessity of immediate action, the result of which was the Aldrich-Vreeland Act of 1908. It was a composite measure which combined the House of Representatives, or Vreeland, proposal of an emergency clearing house currency and the Senate, or Aldrich, proposal of emergency notes based on state and municipal bonds. This law soon came to be recognized as merely an experimental step in banking reform; it was loosely drawn and had to be amended before currency could be issued in accordance with its provisions under the stress of war conditions in 1914. Perhaps its most important feature was the creation of a National Monetary Commission consisting of senators and representatives. Except for the work on the history and current organization of banking with special reference to the activities of European central banks, which was done for the commission by a staff of experts among whom were some of the best authorities of the academic world, the commission was relatively inactive. In January, 1911, Senator Aldrich, the chairman of the commission, submitted to it a bill which with comparatively unimportant modifications was incorporated in the report of the commission of January, 1912, and later introduced in the Senate. The Aldrich bill called for the establishment of a central banking organization with fifteen branches equipped to receive deposits from the government and member banks, to rediscount for banks and bankers and to issue notes which would form a lawful part of bank reserves. The bill never reached a committee consideration, for, the political composition of Congress having changed from Republican to Democratic, the ruling party in the House began preparation of a new and different banking measure.

The new bill, afterward known as the Federal Reserve Act, was begun in March, 1912, reached its first draft in November of the same year and was accepted at Christmas subject to a few changes by the then president elect, Woodrow Wilson. During the winter of 1912-13 it went through a series of hearings before the legislative subcommittee of the House Banking and Currency Committee, was taken up in the special session of Congress called by President Wilson after his accession to office, officially presented to the newly appointed Banking and Currency Committee of the House in May, passed by the House on September 18 and in a considerably modified form by the Senate on December 19, put through a conference committee which virtually restored the bill to the form in which it left the House, and finally put on the statute book on December 23, 1913. In drafting the new law the Muhlman bill, the Fowler bill of 1910 and the Aldrich bill as well as many others were given careful consideration. Its legislative history was marked by the rejection of the plans evolved by McAdoo, then secretary of the Treasury, and Senator Owen, chairman of the new Banking and Currency Committee, and by concessions made to the Bryan wing of the Democratic party in the matter of note issue and governmental control of the Federal Reserve Board.

The Federal Reserve Act sought to reconstruct the entire banking system of the United States by superimposing upon existing banks a new system of organization. This was furnished by the twelve Federal Reserve Banks headed and controlled by the Federal Reserve Board at Washington. The Board was to consist of seven members (after 1922 the number became eight), including the comptroller of the currency and secretary of the Treasury *ex officio*, the membership to be appointed by the president and confirmed by the Senate; not less than two of the members were to have practical knowledge of banking and no two members were to represent the same Federal Reserve district; the term of membership eventually contemplated was ten years. To the Board, which in some circles was regarded as "the supreme court of finance," was committed the large power of making inclusive rules and regulations for the conduct of the system. Each reserve bank was to have a capital subscribed for by member banks in the proportion of 6 percent of their capital and surplus; of the subscribed amount only one half was to be paid in full, the remainder constituting a

liability of the member banks subject to call in case of need. The board of directors of each reserve bank was to consist of nine members: three appointed by the Federal Reserve Board, one of them being designated as the Federal Reserve agent and acting as a liaison officer between the Board and the bank; and six, including three business men and three bankers, elected by the member banks. For the purpose of electing directors the member banks were to be divided into three groups according to size, each group electing one banker and one business man. Despite differences in capital contribution, each member bank was entitled to only one vote within its group. Member banks included all national banks—membership was made a condition for the retention of the federal charter—and those state chartered institutions which satisfied the definite requirements of eligibility and proved acceptable to the Board.

The new reserve banks were to receive within a period of three years the reserves of the national banks. Central reserve city banks, formerly required to hold 25 percent of deposits in vault cash, were now to maintain a reserve of only 18 percent, of which 6 percent was to be cash in vault, 7 percent was to be represented by a balance on the books of the reserve bank of the district and 5 percent might be in either form. Banks outside central reserve cities were to hold smaller reserves divided in the same general proportions. This plan, at first denounced by the large banks in reserve and central reserve cities, whose managers believed it would reduce the volume of deposits of other banks which they could obtain, and by country banks, which would lose interest on their deposited reserves, resulted eventually in a complete shift of the reserves called for without friction or financial stringency. In 1917 Congress reduced the required reserve of central reserve city banks to 13 percent, of banks in reserve cities to 10 percent and of country banks to 7 percent, the entire reserve to consist of a balance on the books of the reserve bank of the corresponding district.

Each reserve bank was authorized to rediscount eligible commercial paper for the member banks. The rules of eligibility were laid down in the act in general terms: the paper was to bear evidence of growing out of bona fide commercial transactions; its maturity was not to exceed ninety days for commercial paper and six months for agricultural and livestock paper. Eligible paper was to have two signatures; but one-name

paper was not thus excluded, for endorsement by the member bank furnished the necessary second signature. In order to prevent the use of reserve system funds for stock market speculation, paper with a security collateral other than government security was made ineligible, but security collateral was not forbidden if the paper was otherwise eligible. The more detailed regulation of eligibility in accordance with these principles was left to the Board at Washington. Rediscount rates were to be established from time to time by each reserve bank subject to approval by the Board. The balances established by member banks with the reserve bank through rediscounting were to be treated in the same way as balances established by the deposit of gold, i.e. as lawful reserves. This rule did not apply in the transition period from 1914 to 1917, when no more than a half of the balance with reserve banks could be established through rediscounting. The reserve banks were required to maintain a gold reserve of not less than 35 percent of their liabilities on deposit balances. Each reserve bank was also authorized to buy and sell paper and securities in the open market subject to considerably less control from the Board than in the case of rediscounting; the open market powers of the reserve banks made the funds of the reserve system available to some extent also to non-member banks.

The note issue problem, which at the beginning of the movement had been primarily responsible for the attempt to correct existing conditions, aroused much less controversy than did the reserve provisions, largely because it was possible to deal with it in such a way as to avoid much trespassing upon vested interests. The Federal Reserve Act retained the national bank-note, merely authorizing the Board to make gradual provision for its retirement; but it furnished the necessary element of elasticity by authorizing reserve banks to issue Federal Reserve notes, based to the extent of their full value on liquid commercial paper rediscounted with the reserve banks and placed in the hands of the Federal Reserve agent; these notes are protected in addition by a 40 percent gold reserve maintained by the reserve bank itself. When commercial paper held behind notes expired it was to be replaced with similar paper or gold or its equivalent. The notes were to be retired by depositing with the Federal Reserve agent the notes themselves or gold or its equivalent. The notes are redeemable in gold either by the reserve bank issuing them or by the

Treasury; they also constitute obligations of the United States and have full legal tender powers.

Among the many new provisions of the Federal Reserve Act there were two which deserve special attention because of their later importance. One was the grant of authority to national banks to engage in fiduciary business on a limited scale. After being called in question on constitutional grounds and sustained by the Supreme Court of the United States, these powers of the national banks were enlarged to the full limit. The second provision was the grant of authority to national banks to accept time deposits, usually referred to as savings deposits. For these the reserve requirement was to be only 5 percent; after 1917 it was reduced to only 3 percent. Both provisions were intended to conciliate banking support in order to render the adoption of the measure easier; and both were to furnish occasion for later difficulties and problems.

The new system was by far the most significant and important change in American banking since the adoption of the national banking system during the Civil War. Yet all its provisions grew out of experience in American banking history, and precedent was found for each in past legislation. It differed from European central banks in method and technique, but not in fundamental principle. Unlike all other central banks it adopted the regional system, with one independent bank to a given area instead of a single main bank with branches. Unlike the Bank of England it adopted the system of commercial asset protected notes instead of the secured currency of the Pitt Act of 1844, and it prohibited dealings with the public except through open market operations. It differed from the Reichsbank in that it refused the issue of notes which could be counted in member bank reserves and required the building up of deposit balances by the member banks which were to trade with it. It declined to support the extension of collateral loans by its members, and it refused all direct relations with the securities market or those operating in it. In contrast with the Bank of France it rejected the principle of widespread direct contact with the public through branches, and it evidently intended to extend the bulk of its accommodation by means of deposit credits rather than notes.

The introduction of the new system obviously demanded the establishment of extensive financial machinery. The act almost unavoidably left a good many matters to be subsequently deter-

mined, merely laying down general rules or broad principles for the guidance of those who were to put the details of the system into operation. In order to furnish the means of making a definite start the act provided for the creation of an Organization Committee. This committee held hearings in various cities and after ascertaining popular opinion determined upon the location of the reserve banks and laid out the districts of which they were to be the respective centers. A committee of technical experts appointed by the Organization Committee prepared plans for the internal organization of the system, which were largely incorporated in the first set of regulations and operating instructions issued by the Federal Reserve Board organized on August 10, 1914. Upon the basis of the plans and rules so furnished, the new system went into operation on November 14, 1914.

The reserve banks came into existence under exceedingly unfavorable auspices. Not only were the larger commercial banks unfriendly to the system, as the result of the friction developed in passing the new act, but the advent of the World War thrust upon the Federal Reserve Board all sorts of unexpected and more or less irrelevant problems with which it had to deal. Prior to the opening of the reserve banks the outbreak of the war had compelled the revision of the Aldrich-Vreeland Act of 1908 and the issue under its provisions of some \$375,000,000 of emergency currency. The duty of retiring these emergency notes and the necessity of providing an emergency currency of the reserve note type prevented the new banks for some time from getting actively into the exercise of their non-currency powers. During the first period of the system's history, from the date of its organization to the entry of the United States into the war in April, 1917, the early difficulties were slowly overcome, reserves were gradually transferred and a limited control over the money and credit situation was established. Such control did not attain recognized proportions until near the end of 1916, but it was sufficient to enable the system to do real work during the first four months of 1917 in preparing for the war, which was now recognized as inevitable. The discount rate question was under discussion but was largely academic. The system, moreover, was beginning to make a strong appeal to the state institutions which at the beginning had abstained from giving it their support. Foresighted trust company executives and state bankers were beginning to file membership

applications in order to be ready to obtain aid and protection in case of urgent need.

With the declaration of war by the United States the system felt the first severe test. The Treasury Department was largely unprepared; neither through issue of loans in the usual fashion nor through the imposition of taxes, whose yield would necessarily be considerably deferred, could it expect to get within a short time the resources it needed. The government fell back at once upon the Federal Reserve system, practically instructing the twelve banks to purchase pro rata a \$50,000,000 issue of 2.5 percent certificates of indebtedness with a six-month maturity. This way of collecting money frightened the banking community and led to the working out of other methods of financing. The Treasury officials devised a general plan of borrowing which called for the issue at brief intervals of short term certificates with recurring Liberty bond placements, the funds obtained through the latter means being used to take up and "refund" the outstanding short term evidences of debt. As the new taxes began to yield revenue the proceeds were to be used in paying war expense, but the immense and unprecedented cost of the war was such that the proceeds of taxation never amounted to more than a fraction of the requirements and the government found itself obliged to rely upon borrowing as a regular resource. This policy was strongly enforced by the generally accepted necessity of making large advances to the Allied governments, which were very short of money. With these added burdens the Treasury gradually found its periodic bond loans, placed presumably in large part with the public, increasingly inadequate, and it tended more and more to rely upon biweekly issues of certificates of three to six months' maturity, which were given a special position as collateral security at reserve banks with a discount rate equal to the coupon rate. Thus by the middle of 1918 the government had fairly definitely accepted the creation of bank credit as the basis of war finance.

Reserve banks had little choice but to adapt themselves as well as they could to the requirements of the time. They did their best to effect a wide distribution of certificates and bonds, but their efforts were necessarily limited by the willingness of the public to buy. The system found itself increasingly forced into the position of a mere adjunct of the Treasury. The Board lost power and finally ceased largely to exert authority except in serving to carry out Treasury

instructions. Commercial paper became scarce because of the general extension of production for or by the government. About the close of the war on October 25, 1918, the twelve banks had combined assets of \$5,270,785,000, of which \$350,311,000 were bonds and other government obligations directly owned, while \$1,092,417,000 were bills secured by government war obligations. On the same date the member banks reporting to the Board owned \$1,967,860,000 government war obligations and granted \$1,165,738,000 in loans on government security collateral. For many months it proved impossible to cease either the advances to Allied governments or the heavy borrowing from the public, so that inflation and heavy lending continued. The fifth Liberty or the Victory loan of \$4,500,000,000 was sold in the spring of 1919; the average daily holdings of war obligations of the government by the reserve banks were at a maximum in September, 1919, while discounted bills secured by government war obligations reached a peak on May 16, 1919, with \$1,863,476,000. At the opening of 1920 two thirds of all bills in the hands of the reserve banks were based on war paper.

The reserve system was now obliged in the interest of safety to retrace its steps and to turn from the inflationary policy which had been forced upon it to a plan of conservation of reserves and moderation in lending. The Board recognized the necessity of eliminating as much as possible of the government obligations from the portfolios of the banks; it likewise felt the urgency of restricting the advances freely made by member banks to borrowers who had no really liquid assets. Many such borrowers had purchased land at very high prices in order to increase their holdings; business men had borrowed in order to carry commodities bought at high prices in the belief that prices would go still higher; it was known, moreover, that a part of the funds advanced by the reserve banks to their members for the purpose of carrying government securities found its way eventually into speculative channels. The inflation of credit was clearly reflected in the rise of prices. The wholesale price level, as measured by the Bureau of Labor Statistics index with 1913 as a base, was 197 in February, 1919; it now proceeded to rise with a steady and apparently uncontrollable movement to 272 in May, 1920.

The war period of reserve banking came to a close in December, 1919, when the Board notified the reserve banks that it was ready to con-

sider their suggestions for an advance in rates. During the war the system had had perforce to maintain a discount rate equal to the interest on Liberty bonds, and after the war a quarter point differential had been added to the bond rate of the Victory loan in order to induce overburdened banks to go still further. Yet the banking conditions were such and the political opposition to a conservative policy was so strong that it was not possible to advance discount rates on commercial paper as distinct from bills with a government security collateral until January, 1920. After January discount rates were steadily raised, reaching 7 percent in June, 1920. The wholesale price level reached a peak in May, 1920, from which it slowly receded thereafter. The recession was sharpened by the dumping of great quantities of hoarded commodities, while continued overproduction of grain sharply reduced prices of farm produce. The price of land fell in line with the price of its produce; security quotations likewise suffered considerable shrinkage. By autumn the existence of a crisis was universally recognized, and general business conditions did not make any real recovery until late in 1921. The expansion of the loans of the reserve banks continued until early in November, 1920, and in Federal Reserve note issues until December 23, but during 1921 the reserve banks strengthened their condition considerably. By the close of 1921 government security holdings of the reserve banks had been reduced to \$241,444,000, while loans on government securities had fallen to \$487,193,000. Farm credit, so excessive in amount, had been somewhat curtailed. The ratio of reserves of the twelve banks to their deposit and note liabilities, which had fallen to 42.4 in April, 1920, had been restored to 72.7 percent in November, 1921, and the gold holdings of the reserve banks replenished by importation had risen to \$2,869,600,000 by the end of the year. The close of 1921 thus marks the restoration of the Federal Reserve system to a position in which it was able to begin the work for which it was originally planned—the strengthening of American banking for peaceful pursuits.

In the first seven years of its existence the system had undergone important alterations of structure introduced by amendments to the act as well as by Board rulings. These modifications were the result of strong pressure for change which has been felt almost from the date of the passing of the act; some of them were also caused by exigencies of war financing. The effect of

these changes was accepted during the war as part and parcel of the financial mobilization of the country; after the war, however, it was recognized that they had permanently altered the character of the system in important particulars.

An amendment adopted in 1916 provided for the direct discounting at reserve banks of the notes of member banks collateraled by any paper eligible for rediscount, the maturity of such notes not to exceed fifteen days. The provision was highly important when it began to be used as a means of obtaining reserve bank funds through the discounting and renewal of paper backed by government obligations. After the war this provision was to furnish the material basis for the financing of speculation. Members' access to the funds of the reserve banks was similarly facilitated by the amendment which reduced the required reserves of member banks. When the United States entered the war, inflation interests again sought authorization to have reserve banknotes counted as an element in the vault cash of members. The plan was only partly successful; discussion resulted in a compromise which cut the required percentage of reserve from 18, 15 and 12, according to the class of the bank, to 13, 10 and 7 without any local vault cash requirement. Since vault cash must, as has been shown by experience, constitute approximately 5 percent of demand deposits, this change in the law implied that Federal Reserve notes might be used as a part of the actual reserves, a privilege which was not enjoyed theretofore by reserve notes or national banknotes. When in the period of expansion following the war reserve banks encountered difficulties in maintaining a strong control over credit extension, a solution was thought to have been found in the Phelan Act passed in 1920 providing for the graduation of discount rates by the reserve banks in proportion to the volume of accommodation secured from them. This device, however, proved unsuccessful and the act was repealed in 1923.

Even before the organization of the Federal Reserve system certain sections of the country were continually pressing for a better adaptation of commercial banking to the satisfaction of agricultural credit requirements. The Federal Reserve Act permitted national banks to extend credit secured by mortgages on farm land with a maturity not to exceed five years and made eligible for discount with reserve banks agricultural paper with a maturity up to six months. After the war the charges that the reserve system

was disregarding the interests of the farmer led to a number of developments in the legislative situation. A congressional inquiry into agricultural credit conditions, prosecuted in 1921 and 1922, revealed errors of judgment and inadequacies of performance but on the whole gave the reserve banks and the Board a tolerably clean bill of health. In 1922 by an amendment to the Federal Reserve Act the membership of the Board was increased by one to make room for a "dirt farmer." Finally, the Agricultural Credits Act passed in 1923, which created intermediate credit banks in order to furnish working capital to cooperatives and other associations serving the farmers' intermediate credit needs, contained also amendments to the Federal Reserve Act. The general tenor of these amendments was to make the funds of the reserve system available to intermediate credit banks and agricultural credit corporations: reserve banks were permitted to buy acceptances and debentures of these institutions as well as to discount paper intended to finance the carrying of agricultural staples; the maturity of agricultural paper eligible for rediscount was also raised to nine months. This easy access to the reserve system funds involves considerable danger, which, however, has never yet been fully felt.

More significant because more immediately successful was the very great development of the bankers' acceptance system. The Federal Reserve Act had for the first time permitted national banks to accept drafts drawn on them, but it attached to this power certain qualifications: the acceptances were to be foreign trade documentary acceptances limited in amount to 100 percent of the capital and surplus of the accepting banks. In 1916 this provision was amended to add the making of acceptances in domestic trade and to permit the making up to an additional 50 percent of a bank's capital and surplus of non-documentary acceptances in order to furnish "dollar exchange" in trade with designated countries. At first the growth of acceptances of all kinds was slow; then serious abuses crept in and had to be eliminated. A new era opened after the crisis of 1920, and when the Board on March 29, 1922, practically surrendered its control over the making of the paper to the reserve banks the paper began to be drawn with much greater freedom. The low buying rates for acceptances, which were steadily maintained, served to act as a temptation to convert into acceptance form many transactions hardly suitable for such treatment, and

with the growth of the volume of acceptances much of the paper tended to become illiquid. Recently it has become clear that after 1927, when European countries resorted to short term borrowing as long term accommodation grew harder to obtain, many of the European finance bills assumed the form of bankers' acceptances. Thus the German collapse in the summer of 1931 made hundreds of millions of dollars non-collectible. Moreover, one of the major purposes for which bankers' acceptances were introduced, the decentralization of the short time money market, has largely failed of accomplishment. Nevertheless, they remain important as the device through which reserve credit becomes accessible to non-member banks, particularly private banking institutions.

In this connection should be mentioned the open market powers of the reserve banks. They had not been much used during the war, but soon after its close they assumed a more important place and after 1923 were exercised through an open market committee, which included several reserve bank governors and enjoyed a considerable degree of autonomy although technically under the general oversight of the Federal Reserve Board. During 1930, the first year of depression after the crisis of 1929, there developed a strong feeling that the open market powers had been used without much regard to the ultimate purposes of the system, particularly in 1927 and 1929, and that open market operations had on occasion offset or neutralized the discount policies, over which the Board exercises a much greater degree of control. As a result a new administrative mechanism was devised in 1930, and the open market organization now includes all twelve of the governors of the reserve banks. Its duty is to determine the total of open market purchases and to apportion them among the reserve banks in consultation with the Board.

Another important achievement of the system was the establishment of par clearance upon a definite basis. For many years before the adoption of the Federal Reserve Act there had been dissatisfaction throughout the country because of the indirect routing of checks with corresponding postponement in collection. This was due in part to the inadequacy of the correspondent system, which linked country banks with institutions in reserve and central reserve cities, and in part to the practise of charging and granting exchange. The act provided that each reserve bank should serve as a clearing house for its

members and that the Board or a designated reserve bank should act as a clearing house for the reserve banks themselves. The Board carried out this latter provision by creating soon after its establishment a "gold settlement fund" planned in accordance with the recommendations of the technical experts of the Organization Committee. The organization for national clearing was on the whole successful; it resulted in eliminating the shipment of gold to and from different parts of the country and in thus concentrating gold resources in what was for all practical purposes a single available fund. The clearance functions of the several banks proved harder to develop; after various experiments, however, there was definitely adopted a plan according to which reserve banks received checks and drafts from members upon deposit and credited them to reserve account after the lapse of a brief period of collection. The length of this period was carefully graduated to correspond with the time required in each district to obtain returns by mail from each of the several banks. But country banks resented the loss of their exchange charges, and while member banks could not help themselves, non-members declined to join the par collection system. The controversy between the reserve banks and the state institutions eventually led to protracted litigation; moreover, several states, chiefly in the south, had adopted antipar collection legislation. Although the Supreme Court upheld the par collection system in its main outlines, its growth outside the Federal Reserve membership has of late years been retarded. Yet the Federal Reserve system has accomplished a very great reform in collection, the elimination of the dangerous "float," or uncollected items, and the lifting of a serious expense from the shoulders of the community. The future prospects of par collection are promising: experience has shown that the convenience of par collection is so great as practically to insure the gradual extension of the system.

The year 1922 marked the opening of a new period in reserve banking. The powers of the Board were in large measure distributed among the reserve banks, and the administration of the latter was gradually altered by custom and practise so as to vest the chief authority in the governor of each bank. The period from 1922 to 1927 was one of great industrial and financial growth as well as of rapid recapitalization and "rationalization" of industry. During these years there developed a new instalment credit system

of domestic marketing and the practise of corporate financing through security flotation rather than borrowing from banks on commercial paper. Particularly after 1925 did the system of floating new issues of capital obligations, using the proceeds to take up outstanding debts at the banks and employing a large part of the balance in call or time loans on the stock exchange become generally accepted among the larger institutions of the country in nearly every branch of industry. The result was a constant increase in the number of bonds and shares listed on the stock exchanges and a decline in commercial paper and direct borrowings at the banks. A parallel development characteristic of this period was the steady acquisition of gold by the country and the reserve system; the monetary gold stock of the United States was thus increased from less than \$3,000,000,000 at the beginning of 1921 to over \$4,600,000,000 in May, 1927. The reserve banks placed few or no obstacles in the way of the financial community, which used the inflowing tide of gold for commercial and industrial expansion. Nor did the reserve banks attempt constructive action in controlling the expansion of foreign investments of the United States, which proceeded at a rapid pace. The aid of the system, which usually acted through the administrative machinery of the Federal Reserve Bank of New York, was, however, essential and effective in supporting and financing the operations of European central banks by which the principal European countries found their way back to a gold or a gold-exchange monetary standard. Unfortunately serious mistakes were made in supporting hasty or too ambitious schemes of monetary reform.

The period beginning with 1927 presents the latest phase of Federal Reserve policy. At the beginning of this period the behavior of the business community at large displayed evidence of unrestrained optimism, a state of mind which seemed justified by the constant advance of stock market prices and the apparent certainty that almost every kind of security, if provided with what was called satisfactory sponsorship, would move to higher levels of value. It was a situation in which the reserve banks had a great opportunity to apply corrective measures. Sharp differences of opinion, however, had broken out among the managers of the system. Between the Board and several of the reserve banks, among the banks themselves and within the Board's own membership these differences had become pronounced. During the early part of 1927 the

policy of discount rate reduction was on the whole in the ascendant in the system. Discount rates were kept down to low levels and credit was rapidly inflated. An enormous volume of bankers' acceptances came into existence; these were largely purchased and held by the reserve banks, partly for their own account and risk and partly for those of foreign banks. Stock quotations were pushed to fabulous heights by the free use of brokers' loan funds in advances to speculative customers. After the 1928 presidential election a further general inflation of credit took place. It was not until the following spring, with the steady advance of prices and the growing recklessness of the market, that the higher rate party in the reserve system achieved an incomplete victory. In the course of 1928 discount rates were raised three times from 3.5 to 5 per cent at the Federal Reserve Bank of New York; in August, 1929, they were advanced to 6 per cent.

As these figures were far below the current charges for call money at the time and as the speculative public paid little heed to these changes, the rate advance did no good. The rise of prices, particularly in a limited list of shares, continued still further, and brokers' loans maintained their steady growth. The culmination came on October 24, 1929, when a severe crisis occurred in the stock market. This was followed by successive periods of liquidation alternating with temporary and partial recoveries extending throughout the year 1930 and the first half of 1931 (the last period for which information is available at the time of writing). The credit position of the member banks of the system was radically changed, with correspondingly decisive effects on the reserve banks. Brokers' loans to customers, as measured by borrowings on collateral by members of the New York Stock Exchange, had been steadily increasing until the fall of 1929, when they totaled about \$8,500,000,000. The outbreak of the panic led to the active calling of these loans and within six months they had been reduced by more than a half. This decline in brokers' loans, the result of a withdrawal from the market of non-banking lenders and of banks outside New York City, was offset to some extent by an increase in loans on securities by New York City banks. By the spring of 1931 borrowings by brokers and dealers in securities were again at their pre-war level, while loans on securities by member banks had reached their peak in the middle of 1930. Reserve banks cut their rates as soon as the existence of the crisis was

definitely recognized; the last series of reductions declared in May, 1931, brought the rates down to 1.5 percent for New York and from 2 to 3.5 percent for the other banks. Meantime suspension of foreign financing had induced a further inward movement of gold and had again given a fresh impetus to "easy money." The reserve banks, however, had not been able to prevent the steady increase in bank failures, which reached a maximum of 1345 in 1930; the resources of the banks suspended in that year were probably in excess of \$1,000,000,000.

Experience during the last period of the history of the system renders possible its evaluation in the light of the expectations of its advocates and founders. In both of the major depressions during its existence the system has proved fully adequate as a preventive of currency "panics," which before 1913 were so familiar as to appear inevitable. Few banks which could present satisfactory paper have been refused accommodation or have been unable to obtain notes in amounts sufficient to satisfy depositors desirous of drawing their "money." Far less success has been enjoyed in connection with the control and direction of credit. But perhaps the least satisfactory phase of reserve banking is its ineffectiveness in relation to bank failures; there is no conclusive evidence that member institutions have been less liable to failure than have others. Opinion is divided as to the reasons for this lack of success. Some observers emphasize the inability or indisposition of reserve institutions to use their power of examining or inspecting members, others the indiscriminate methods of rediscounting and still others the lack of credit control methods applied at a date sufficiently early to prove effective. To some extent the inability of reserve banks to aid large member banks which have found themselves in a critical position is to be ascribed to fundamental changes in the prevailing methods of financing business, which have basically altered the character of the paper held by member banks, thus preventing them from holding as large a quantity of eligible commercial paper as they should.

It is this change in the nature of the member portfolios that has perhaps more than anything else led to departures in practise from the original intent of the act and has furnished a plausible reason for discount policies often charged with an undue friendliness for "speculation." The amendments to the act, as they have worked out under conditions of war and post-war public finance, have put in the hands of the banks an

immense volume of short term treasury certificates available at all times as a basis for unlimited extension of credit. Thus a mechanism has been set up for increasing credit without regard to the total of commercial paper outstanding. It has been the contention not only of many reserve bank officers but of capable commercial bankers as well that the decline of the old fashioned type of bank loan growing out of business transactions had largely driven the reserve banks to a policy in which advances were made indiscriminately against the treasury certificates as collateral; since such loans afforded on their face no evidence as to the necessities that gave rise to them or the uses to which their proceeds were to be put, this system of granting credit almost unavoidably enabled borrowers to draw what they needed from the reserve banks for speculative operations. However it may be explained, there is no reason to believe that since the creation of the reserve system the proportion of banking funds devoted by the nation at large to speculative operations has been at all lessened. On the contrary, it has been considerably increased, although it would be difficult to venture even an approximate estimate as to whether such increase has been out of proportion to the general expansion of industry and trade and the growth in the number of listed issues.

Much greater success has clearly been attained in regulating the geographical distribution of funds among different parts of the country; this may doubtless be regarded as one of the principal achievements of the reform. The manner in which the clearing and gold settlement provisions of the act have been carried out, the exercise of open market powers and the use from time to time of rediscounting between reserve banks have tended to diminish the hitherto pronounced regional differences in rates of interest and discount for short term paper. Whatever differences remain are explicable chiefly in terms of variations in risk and in character of security offered. Moreover, in insuring a decidedly better and easier movement of loan funds to regions where they are needed the system has eliminated what might otherwise be wide seasonal fluctuations in rates and in the current supply of "money." The crop moving season, formerly so difficult and disturbing each year, has ceased to be regarded as an important factor of financial friction between communities and regions.

It is more difficult to evaluate the effect of the reserve system upon the credit technique of

commercial banking. During the first years of their operation the reserve banks succeeded in raising somewhat the standards of banking practise, as was intended at the time the act was passed, but the effort was interrupted by the entry of the United States into the war. Attempts to reintroduce two-name commercial paper, the trade acceptance, were not resumed after the close of the war. With the growth of a practise of lending against Treasury certificates there was less interest in the building up of elaborate credit files; and in lieu of the latter the custom of demanding collateral to protect eligible paper offered to reserve banks has gained ground. In the course of time the reserve banks have been increasingly inclined to follow existing practise in most directions and to abstain from efforts at leadership. The expectation that the creation of the reserve system would improve and strengthen credit technique has thus been largely disappointed. Much the same is true of bank examination, although some results have been accomplished in various districts through collaboration with state and national examining authorities.

It was anticipated that reserve banks, whose management was elected by the members on a democratic basis ("one bank, one vote"), would arouse the interest of the local banker and develop a strong corps of observers and critics who would keep the system under constant supervision and eventually modify it to accord with local interests and the best local practise. But later experience showed that these hopes were not justified; the small banks in particular generally make little use of their voting rights. With this feeling inside of the system it has been difficult to build up a clientele of support from the outside. At first state banks were slow to join because of the loss of interest on their reserve balances. They came in much more freely later, when the United States entered the war, because they feared a severe credit stringency and thought that the help of the system would materially strengthen them. After the panic and depression of 1920 and 1921, during which the performance of the system fell short of their expectations, their membership fell off. The membership of state institutions reached a high point in 1922, when it numbered 1639; it has declined fairly steadily since then, but an important factor in this connection is a reduction in their number owing to mergers and suspensions.

A factor which has doubtless retarded the

natural expansion of the system has been the failure to develop a genuine local discount market about each reserve bank. The regional system of organization had been criticized from the outset by bankers who desired a single central institution and was defended on the ground that only by regional organization would local markets be likely to be brought into existence. Experience has shown that such markets can be successfully evolved. In at least two or three districts outside New York considerable progress has been made in that direction; but elsewhere the correspondent bank system, strongest in New York and Chicago, has tended to inhibit such development so that the reserve banks of some districts still buy in the New York market the acceptances made by their own members and sent to New York for disposal. The failure to develop local markets is cited by critics as evidence that they are not wanted or not needed and that one central bank with branches would have been preferable to the regional organization. It is to be observed, however, that the regional plan is approved at present by many of those within the system who opposed it in the beginning and that some of the factors which prevented a more rapid development of local markets will prove less important in the future.

The reserve banks have had far greater success in the integration of the entire banking system of the United States than appears on the surface. Although disappointment at the failure of state institutions to become members in larger numbers is justified, it is not to be overlooked that non-member state banks have indirectly received nearly as much benefit from the system as have those which accepted membership. The creation of an incipient discount market, the free purchase of acceptances whether originated by state or national institutions and in some cases the purchase of state bank paper with member endorsement have all been factors of support and sometimes of emergency relief. Agricultural credit organizations, which were permitted by the act of 1923 to deal in specified circumstances with reserve banks, have from time to time received much needed help and have been able to accomplish many results that would otherwise have been impossible. For the first time in American history there has been a substantially uniform foreign banking policy which, whether sound or not, has been representative of the entire nation.

A general evaluation of the Federal Reserve system and its work is thus composite in nature,

Federal Reserve System—Federal Trade Commission 165

Few of the dangers and probably none of the injustices foreseen by its opponents at the outset have been incurred. Without it the war could not have been financed with anything like the success actually attained. General suspensions of payment like those of the national banking era have been dispensed with, and a serviceable, even if not very flexible, banknote currency has been furnished in adequate amount. Some control over foreign financial relations has been provided, and the ability to exert a genuine influence upon the volume of domestic credit and its distribution has been exhibited, however fitfully and hesitantly. Business has at times been materially aided and cost of credit standardized and reasonably lowered. Checks are more nearly at parity throughout the country than ever before and a severe burden of exchange charges has been lifted from the shoulders of the business public. Gold has been economized and its constant shipment back and forth across the country ended. But the termination of the sub-treasury system is still to be given its full effect by a skilled and non-political use of public funds and public borrowing powers. And most of the greater objects of the system—such as the fairer division of banking facilities, the real control of credit and the sound limitation of speculation—remain to be more fully accomplished in the future.

FEDERAL TRADE COMMISSION. This independent commission, created by Congress in 1914, is part of the federal structure designed to safeguard the competitive scheme of economic organization in the United States. Its particular role is to make various economic investigations and reports, to prevent certain abuses of the competitive system by legal processes of its own initiation and to act in an advisory capacity in the administration of the federal antitrust laws. The Commission also supervises export associations under the terms of the Export Trade Act of 1918.

The Commission's powers of investigation, apart from those incidental to its work of law enforcement, were intended to make possible a continuing public check by an expert governmental body upon the operation of the competitive system and to protect that system from abuses by inviting the "curative power of public opinion," antitrust law enforcement or added legislation. By the act creating it the Commission was empowered to "investigate . . . any corporation engaged in commerce" except banks and common carriers whose regulation is entrusted to other governmental agencies, and to "require . . . annual and special, reports . . . or answers in writing to specific questions, furnishing to the commission such information as it may require as to the organization, business, conduct, practices, management, and relation to other corporations, partnerships, and individuals." It was also authorized to investigate "trade conditions in and with foreign countries" which "may affect the foreign trade of the United States," and upon direction of the president or either branch of Congress to "investigate and

report the facts relating to any alleged violations of the antitrust Acts by any corporation."

With the exception of trade secrets and names of customers the Commission was authorized to make public such portions of the information obtained through its investigations as it should "deem expedient in the public interest" and to make annual and special reports to Congress, including recommendations for legislation. To reenforce the Commission's powers of investigation, in the exercise of which it was designed to continue and expand the work of the Bureau of Corporations created in 1903, provision was made for the recourse to the courts for mandamus proceedings; and the imposition of fines on corporations and of both fines and imprisonment on persons was authorized in case of refusal to comply with its requests for information.

The powers of the Commission to prevent abuses of the competitive system by legal processes instituted by it were embodied in section 5 of the act creating it and in sections 2, 3, 7 and 8 of the Clayton Act passed in the same year and as part of the same legislative endeavor. By the sections of the Clayton Act, in the enforcement of which the Commission was given a supplementary jurisdiction, price discrimination, "tying agreements," intercorporate stock acquisitions and interlocking directorates were prohibited under certain conditions believed by Congress to obstruct materially or to destroy competition. By section 5 of the Commission act "unfair methods of competition" were declared unlawful, and the Commission was "empowered and directed" to prevent them when such a course "would be to the interest of the public." Banks and common carriers were excepted from the Commission's field of law enforcement, as meat packing establishments and stockyards have been since 1921, when special federal legislation was enacted to deal with them.

The administration of these provisions was reinforced by no criminal penalties. After establishing an offense the Commission was empowered to issue its order to "cease and desist." Should the order be ignored, the Commission was authorized to appeal to the appropriate United States Circuit Court of Appeals, as could those seeking to have the order set aside. Ultimate appeal to the United States Supreme Court on writ of certiorari was authorized with provision that in all court proceedings "the findings of the commission as to the facts, if supported by testimony, shall be conclusive."

In the administration of the federal antitrust

laws, apart from those in the enforcement of which it was given jurisdiction, the Commission was given various advisory powers, the legislative design being to temper the enforcement of these laws with expert economic counsel. Upon the application of the attorney general, who heads the other major part of the federal establishment designed to protect the competitive system, the Commission was empowered "to investigate and make recommendations for the readjustment of the business of any corporation alleged to be violating the antitrust Acts" to bring it in accord with law. Upon similar application or its own motion the Commission was empowered to investigate and report on the manner of compliance with any final antitrust law decree. And at the request of a federal court it was authorized to serve as a master of chancery in the framing of suitable decrees in equity suits brought under the antitrust laws.

The organization of the Commission, whose authority is vested in five commissioners appointed for seven-year terms by the president and confirmed by the Senate, reflects its dual nature as an investigating and law enforcing body. Its principal divisions, in addition to an administrative division, are economic and legal, the former being concerned primarily with general economic investigation and the latter with the enforcement of statutory provisions relating to competition. While the Economic Division has remained a single unit under the immediate direction of a chief economist, the Legal Division has become progressively more complex in organization and at present consists of six separate and independent units, also designated as divisions, each responsible only to the Commission.

The relationships of these legal divisions may be suggested by a rough review of the Commission's procedure in handling its work of law enforcement. When the Commission receives an application to eliminate an offense against the statutes entrusted to its enforcement, the application is referred to the Chief Examiner's Division unless it involves a charge of false and misleading advertising, in which event it goes to a Special Board of Investigation set up in 1929 to deal exclusively with such offenses. The Chief Examiner's Division, which also handles inquiries directed by the president, Congress or the Commission when they are primarily concerned with a legal question, then determines the substance of the application and, unless it is patently unsuited to Commission action and

capable of informal disposition, makes a report and recommendation. This is then referred to the Board of Review, or directly to the Commission, if dismissal of the application is recommended. The Board of Review then recommends to the Commission outright dismissal of the application, dismissal after the entering of a "stipulation" or the issuance of a complaint on behalf of the Commission. In the latter event the complaint is prepared by the chief counsel, who represents the Commission in subsequent legal proceedings, acts as its general legal adviser and supervises the work of an Export Trade Division engaged primarily in administering the Export Trade Act of 1918. If the complaint is contested it is referred to the Trial Examiner's Division, a representative of which takes the evidence and prepares a report of the facts for the Commission. After the conventional legal formalities the case is then brought before the Commission for final argument, and its order of dismissal or to "cease and desist" is entered.

To deal with unfair methods of competition en masse as opposed to individual cases the Commission has since 1926 maintained a Trade Practice Conference Division. Here the procedure, first adopted in 1919, is to have representatives of an industry assemble voluntarily under the Commission's auspices and at its discretion with a view to devising rules to eliminate unfair competition in the entire industry. Those rules which are jointly approved by the Commission and a satisfactory representation of the industry are officially designated as the "final rules of the trade practice conference." They fall into two groups: (1) those covering practises which in the judgment of the Commission are illegal and subject to elimination by its formal complaint, and (2) those which are expressions of opinion as to desirable practises for the industry to follow. After the final rules are promulgated, the Trade Practice Conference Division endeavors to secure compliance with them by establishments not represented at the conference at which they were formulated and reports directly to the Commission all violations of the rules. Such reports on group 1 rules may be the basis for the Commission's formal complaint.

In the field of economic investigation the Commission has carried out only a part of the program contemplated by Congress in creating it. The Commission still awaits a decisive ruling by the courts on its power to command information for purposes of general enlightenment as opposed to the much more restricted pur-

poses of law enforcement. Both by voluntary contributions of information and contributions secured in response to resolutions directing investigations of alleged violations of the antitrust laws the Commission has compiled a substantial library of economic reports. During recent years most of the additions have been made in response to Senate resolutions. Some of the Commission's investigations and recommendations, notably those on *Cooperation in American Export Trade* and the *Meat Packing Industry*, have resulted in legislation.

In the field of law enforcement most of the Commission's work has been predicated upon the mandate to prevent "unfair methods of competition." In construing this phrase the Commission has held it to cover not only violations of the Sherman Act of 1890, the basic federal antitrust law, but also practises of an immoral and fraudulent nature which are related only remotely if at all to monopoly and restraint of trade. While it has thus addressed itself to certain practises and arrangements of an essentially monopolistic nature, the general drift of its decisions has been toward emphasis upon certain standards of commercial conduct without immediate reference to monopoly and restraint of trade. In recent years misbranding, false and misleading advertising, misrepresentations of various sorts, "passing off" and commercial bribery have constituted the basis for the bulk of its decisions.

In defining "unfair methods of competition" the Commission has been largely controlled by the federal judiciary. The United States Supreme Court has held that "it is for the courts, not the commission ultimately to determine as a matter of law what they include." This court has also undertaken to determine the "interest of the public" which the Commission is directed to protect (as has the Commission by formal statement of policy) but in terms so general that the only abiding proposition established is that the judgment of the courts is controlling.

The Commission's policies of law enforcement have recently tended strongly toward emphasis upon what has been termed prophylaxis as opposed to prosecution. Since 1925 it has extensively followed a policy of settling cases by "stipulation" and on generous terms with reference to publicity. In its discretion but in pursuance of a policy that "all cases shall be settled by stipulation except where the public interest demands otherwise," a party liable to formal complaint is allowed to sign a stipulation of the

facts about the practise and an agreement to "cease and desist forever," with the understanding that "should he ever resume it the facts, as stipulated, may be used in evidence against him in the trial of a complaint which the commission may issue." The proceeding is then dropped without making public the name of the offending party but with an anonymous statement of the practise condemned. This publicity arrangement has been bitterly attacked by a minority of the Commission as placing that body in the position of protecting lawbreakers, but it has been retained. And the general "stipulation" procedure, which was employed for the first two years of the Commission's existence and then dropped until 1925, has been extensively used, 672 "stipulations" having been entered in the five-year period prior to June 30, 1930, in comparison with 431 formal complaints.

In keeping with the prophylactic motif the Commission has also greatly extended the scope of its trade practise conferences. During the year ending June 30, 1930, fifty-seven such conferences were held, almost half the total number held since the proceeding was originated in 1919. In pressing this procedure, which the Commission asserts "performs the same function as a formal complaint without bringing charges, prosecuting trials, or employing a compulsory process, but multiplies results by as many times as there are members of the industry who formerly practiced the methods condemned and voluntarily abandoned," the Commission may have paved the way for some violations of the antitrust laws. The officer of the Department of Justice in immediate charge of antitrust law enforcement stated in 1930 that "there have been recent instances where . . . price fixing has been attempted by the misuse of so-called Codes of Ethics or Trade Rules." Since then the Commission has revised the rules adopted by most of the trade practise conferences held under its auspices.

The role which Congress contemplated for the Commission as an expert economic adviser on the enforcement of the antitrust laws by the Department of Justice and the federal courts has been very little developed. The attorney general has rarely called upon it for advice, and the Commission has proffered little except indirectly, as in response to congressional resolutions. The Commission has never been called upon to act as a master of chancery in framing an antitrust decree. At times, as in the case of resale price maintenance, the Department of

Justice and the Commission have worked quite independently on the same question but recently efforts to develop a greater degree of cooperation have been reported.

Viewed in relation to congressional design in creating it the accomplishment of the Commission has been meager. As an instrumentality for information and publicity about the performance of the competitive system it has done much valuable work but only a small fraction of the work of this type requisite to an enlightened public control of competition; nor has this work been done by other governmental agencies. As an adviser on antitrust law enforcement the powers of the Commission have been barely touched. In law enforcement its most extensive accomplishment has been in the field of commercial ethics rather than of monopoly and restraint of trade, to which the legislation creating it was primarily directed.

For the fact that the Commission has had relatively little success a great variety of causes might be assigned. Among these a lack of sympathy with certain of the main objectives of the 1914 legislation on the part of some of the members, the great technical difficulty of the program involved and adverse court decisions would probably bulk large. The principal cause, however, has probably been the change in public attitude toward the question of antitrust law enforcement since 1914. More recently there have been some slight evidences of a renewed interest in the general objectives sought by the 1914 legislation. Should these materialize in any substantial degree, the Federal Trade Commission would probably reflect the change as it has reflected general changes in economic ideology since its organization.

FEDERALISM in its broadest and most general sense is a principle which conceives of the federation as the ideal form of social and political life. It is characterized by a tendency to substitute coordinating for subordinating relationships or at least to restrict the latter as much as possible; to replace compulsion from above with reciprocity, understanding and adjustment, command with persuasion and force with law. The basic aspect of federalism is pluralistic, its fundamental tendency is harmonization and its regulative principle is solidarity. Carried to an extreme, federalism becomes pacifistic and approaches syndicalism and anarchism. Proudhon, the French socialist, wrote in 1863: "Only federation can solve, in theory and practise, the problem of an adjustment between the principles of liberty and authority by leaving to everyone his proper sphere, his true competence, and his full initiative. Therefore federalism alone warrants on one hand the ineffaceable respect for the citizen as we! as for the government, and on the other, order, justice, stability and peace." In 1862 Constantin Frantz, the German journalist, had employed the modes of thought of the speculative-romantic philosophy to express similar ideas: "What must federalism do in order to found such a union? Nothing more than draw particularism, i.e. individuality, out of its retirement and introduce it into the community, at the same time that it complements centralization by means of individuality and renders the union more real through the liberation of individuality." Unconsciously the Frenchman had in mind the memory of the bloody conflicts at the height of the French Revolution between the federalism of the Girondists and the centralism of the Jacobins. The German thinker was guided by the organismic conceptions of a philosophy conceived against the background of the complicated constitutional relations which had developed in the old German Empire. He was also influenced by his antagonism to the first steps of the centralizing Prussian policy by which Bismarck intended to establish the empire. In modern sociology federalism was revived by the neoromantic school of Othmar Spann under the term "universalism."

Federalism postulates that the state likewise should join a more comprehensive federal system (Concert of Nations, pan-Europe, League

of Nations) and, similarly, that the parts of the state (the member of confederate states) also be constituted on a federal plan. In this sense federalism aims at a universal social organization which attempts to realize liberty by establishing fraternity without being equally concerned about equality. Accordingly, the theory of federalism frequently acquires a utopian character.

In its application to concrete political problems federalism becomes a relative and dynamic principle. One may distinguish a centrifugal and a centripetal federalism. The federalist tendencies of continental Europe during the nineteenth and twentieth centuries were mainly centrifugal—a reaction against the unitarism which was prepared in France during the monarchy and put into practise in an exemplary fashion during the French Revolution by the Jacobins and by Napoleon. Under French influence unitarism progressed in Russia, especially under Peter the Great; in Prussia under Frederick William I; and in Austria under Joseph II. Similarly, the unification of Italy took place in conformity with the principles of unitarism, because there federalism was considered a doctrine of disintegration and foreign domination. Besides, the existence of the Papal States impeded a solution along federalist lines. Although the unitarian tendencies in Germany foundered in 1848 and the Reich which Bismarck created in 1871 was organized according to federal principles, the reform of the Swiss constitution of 1848 tended toward unitarism. At the same time Austria experimented with a greater centralization, which was also the aim of the German constitution of 1919.

In the face of a tendency to establish complete unitarism federalism becomes a principle of opposition. It unites itself with forces which are unpolitical, hostile to the state and, if carried to an extreme, anarchical; and through this alliance or psychological coloring it becomes discredited as a constructive political principle. The government and such groups as maintain a positive attitude toward the state fear that federalism may bring about a weakening of the state and lead to disintegration in the form of irredentism or separatism. If federalist tendencies conquer a state constituted mainly on the principles of unitarism, the result is more likely to be decentralization than federalism proper. For all practical purposes, however, the transition from federalism to decentralization remains one of degree.

Wherever federalism consciously and system-

atically and by the use of proper measures and institutions emphasizes and guarantees union and solidarity in the federal state it becomes a patently centripetal and conservative principle. In such a case the antithesis of federalism is not unitarism, but particularism and separatism. In the Anglo-Saxon countries and especially during the last decades in the British Empire federalism has possessed such a positive meaning. There federalism, by professing the principle of the equal rights of all members, acts as a counterweight to the desire of the component parts for independence and hegemony. It is noteworthy that the same symbol or institution, the crown, which stood for centralization in France now stands for federalism in the British Empire. While federalism as an element of opposition easily becomes doctrinaire and degenerates into anarchism, in connection with certain forms of imperialism it has definitely proved itself an aid to the highest kind of statesmanship and has furthered the preservation of the state. Even in the former Austrian Empire, in spite of strongly centrifugal tendencies, a peculiar combination of monarchism and federalism postponed for a long time the threatening disruption, until finally defeat in the World War brought the collapse of the empire. Thereupon its peculiar problems were transferred to the countries which succeeded it.

Federalism in its practical application manifests itself differently according to the sociological factors which it attempts to regulate and which form its basis. The purest and most consistent form of federalism appears where it follows traditional political lines. The old states of Europe are almost entirely of dynastic origin. In many instances territories were added by conquest, by bequest or at times by purchase. While mediaeval feudalism facilitated the disintegration of ethnically homogeneous regions, the absolutism of the early modern period, which even in France began its centralizing work very circumspectly, generally developed from a personal union into a real union and only gradually prepared the way for unitarism. Territories which received a new suzerain retained their self-administration under native leadership and their traditional rights, customs and regional peculiarities. It was possible to spare local tradition as long as the principle of absolutism remained unshaken and the tasks of the central state were limited in scope as compared with the autonomous territorial and local jurisdictions. Swiss federalism did not rest upon eth-

nical but upon local and traditional factors, determined by the particularistic and conservative mentality of the Alemannic race as well as by the geographic conditions of a mountainous country and peculiar sociological conditions. Consequently, Switzerland achieved the earliest and most enduring form of a purely republican and democratic federalism. Similarly, the federalism of the Anglo-Saxon and the Iberian nations is based primarily upon geo-political and historical circumstances and not upon race or nationality, the differentiating effects of which were of only secondary importance. The thirteen British colonies in North America gained their independence in a manner reminiscent of the original cantons of Switzerland and formed themselves into a democratic and republican confederation which, like the Swiss, later augmented its territory. About the middle of the last century England seemed threatened with a progressive decomposition of the empire, until about 1860 British imperialism entered into its peculiar synthesis with federalism. The creation of colonial and imperial conferences, a gradual raising of the status of the dominions and reduction in the hegemonial demands of the mother country and the assistance of federalism have enabled the empire so far to adapt itself successfully to a changed world. Bismarck mastered an especially difficult task in federal organization by opposing the revolutionary tendencies of 1848 with a carefully tempered legitimistic federalism and by creating the new German Empire as a polydynastic federation with the office of the emperor as its presidial head. The articles of the German constitution of 1871 were wisely formulated so as to spare the particularistic sentiments of the German sovereigns and states and yet prepare the way for an organic coalescence into a more unified empire. The development after 1918 proved that this consolidation had advanced sufficiently to keep the Reich from disintegrating even after the disappearance of its dynasties. Yet in spite of the strongly unifying tendencies of the Weimar constitution the traditional federalist forces within the states have proved so strong that only a few consolidations (mainly in Thuringia) of the overdivided German territories had taken place. The Republic of Austria in 1919 also constituted itself on a federal plan in spite of its ethnic homogeneity and opposed quite strongly the centralizing tendencies of the Austrian Social Democrats.

With the spread of nationalist ideas in the

nineteenth and twentieth centuries the principle of federalism acquired a peculiar significance and at the same time became more complicated. In former centuries differences in religion and customs demanded different treatment of subjects. Now differences in nationality represented chiefly by different languages and, in countries which possessed colonies, racial differences have made themselves felt as factors endangering the principle of civic equality. Federalism could be applied within a state to the organization of national groups wherever these inhabited distinctly separate territories and especially where in the course of history they had been subject to a uniform administration. Yet even where this was the case the obvious trend was not toward federalism, but toward autonomy or decentralization. Federalism presupposes a certain equality in size and cultural level and a common allegiance among the nationalities joined under the same state; actually they were often numerically weak minorities, possessed a low cultural level or as the inhabitants of conquered territories were suspected, rightly or wrongly, of irredentism and separatism. Besides, a politically conservative federalism frequently clashes with a demand of long standing for a redistribution of territory on an ethnical basis. This is true to a certain extent even of Switzerland, which is wrongly considered a model for the solution of national problems. The federal organization of the cantons is in no way based upon ethnic or linguistic principles; there are several polyglot cantons, and neither German, French nor Italian Switzerland is a constitutionally recognized individuality within the confederation as a whole. The same statement can be applied to former Austrian territory, where the historical provinces (crownlands) lacked ethnographical unity, as did the largely autonomous administrative districts of Hungary (the *Comitats*). Accordingly, all projects of a federal organization discussed in Austria-Hungary after 1848 by Palacky and Löhrner met the violent opposition of conservative-federalist circles and frequently even that of the national groups themselves, who wished to assimilate their own ethnic minorities and therefore did not favor a clean cut reorganization along ethnographic-territorial lines. They considered as revolutionary the proposals, arising primarily from within the ranks of the Austrian Social Democratic party and advocated by Bauer and Renner, for a regulation of the legal status of the nationalities according to "personal" instead of "territorial" principles. Since a satis-

factory demarcation of the national districts proved partly impossible, partly inexpedient, it was proposed to register the ethnical groups and to organize them for national and cultural purposes as cooperative unions. In this case federalism was replaced by the principle of a territorial autonomy, or "group federalism."

While in central Europe ideas of autonomy became, theoretically at least, increasingly prevalent as a solution of the problem of nationalism, the national aspirations of the rest of the world continued largely to move within federalist ideology; for example, certain national aspirations within the British Empire and in the Near East. Yet even the radical federalism put into practise by the Soviet Union offers merely a sham solution of national and especially cultural problems. The formation of Soviet republics and autonomous territories with national nomenclatures seems to follow the principle of separating the domain of cultural activities from that of government proper. While politics as such is strictly centralized in Russia, culture as determined by social and religious factors is to a certain extent decentralized. The Communist zeal for revolutionary reorganization goes so far that the central organization artificially revives the national life of even the smallest nations and tribes. This very procedure of the Communists demonstrates that they are not seriously considering a real recognition of national individualities. Their efforts serve mainly the ideas of the social revolution, the mobilization of the illiterates and of the conquered and uncivilized tribes against their own upper classes. This policy is furthermore used in propaganda abroad to revolutionize the neighboring countries in the west (especially Poland and Rumania) and to excite the natives of the British colonies. Its final aim is solely the winning of allies in the revolutionary class struggle and world revolution. Accordingly, Russian methods cannot be applied to countries which adhere to a Christian culture and to stable social traditions without endangering the foundations of their very existence.

Yet the propaganda of Soviet federalism gains strength from the social and constitutional crisis which the British Empire and the continental European countries are undergoing, and in which the ideology of federalism plays an important part. This applies especially to those polyglot countries of Europe which have modeled their centralism on the pattern of France and which are therefore now finding themselves in serious difficulties. In France itself a move-

ment opposing the centralization of culture on the basis of a so-called regionalism had already sprung up about the middle of the nineteenth century and manifested itself chiefly in southern France, in the Provençal, Basque and Catalan regions but also in Brittany and among the Flemings of northern France. The very strong autonomous tendencies within Alsace-Lorraine have considerably increased the political strength of French regionalism, which is tending in its program partly toward economic, partly toward political, federalism. The attempt to unite Serbs, Croats and Slovenes in a Yugoslav nation, in spite of their considerable difference in language, culture and especially religion, met strong opposition, mainly because of the desire of the Serbs to exercise hegemony. This opposition has caused revolutionary disturbances in Macedonia and recently also in Croatia. To a lesser extent the same statement could be applied to the attempt to weld Czechs and Slovaks into a unified Czechoslovakian nation. The added factor of a large and compact German speaking territory in Czechoslovakia might suggest to that country a reform along federal lines; this, however, the Czechs oppose. Even a single people, the Poles, after the restoration of their state showed themselves so differentiated through the Russian, Austrian and German domination that centralization was not possible without friction (for example, the promise to give autonomy to Upper Silesia). Furthermore, in both Spain and Belgium the demand for federalism has increased since the war. In Belgium the nationally conscious Flemings and some of the Walloons demand separate administrations for their respective regions. The overthrow of the Spanish monarchy in 1931 was caused largely by the attempt of the dictatorship to suppress by force the federalist aspirations of the Catalans and Basques. Finally, even in Germany tendencies toward a new territorial demarcation have sprung up since the war, tendencies that are not founded upon linguistic and ethnical principles but rather on cultural traditions; it is not likely, however, that revolutionary upheavals will result. Another victory was gained for the principle of federalism when Ireland received the status of a dominion, although the question of Ulster continues unsettled.

Federalist theories are also frequently employed by movements advocating a confederation of existing governments without the impairment of their sovereignty, in contrast to the customary leagues ultimately determined by the

requirements of war. The characteristics of federalism in a broader sense may be found in regional economic agreements, such as customs unions, and also in such movements as Pan-Americanism, Mitteleuropa, the pan-European movement and pan-Slavism. With some reservations even the League of Nations may be so classified. Such programs and institutions are frequently abused as a shield for a particular brand of hegemony, as in the pan-Slavic movement. When international federalism is sincerely conceived it frequently does not progress beyond the stage of impractical idealism. Yet it cannot be denied that pacifism, growing everywhere as a result of the encraving effects of the World War and the fear of new wars, has created a readiness to solve international problems with the aid of federalism. As yet the forms of these solutions are perceptible only in vague outline upon the horizon of practical politics.

FEDERALIST PARTY, UNITED STATES.

See PARTIES, POLITICAL.

FEDERATION. The term federation is variously employed to indicate a relationship, the process of its establishment or the entirety of a

complex organization that embodies it. The etymological kinship of the word (from Latin *foedus*) with ideas of treaty and of contract illuminates but no longer fixes the meaning of a protean and widely applicable principle. The essential relationship involves a division of activities between the autonomous parts and the common or central organs of a composite whole. Arrangements inherently so conditional do not foster an absolute nomenclature. Usage must look in two directions. As a deliberate phase of the structure of certain modern states federation has acquired legal attributes which should be insisted upon, if only to retain the perspective necessary to an appreciation of the significance of institutional variations and inventions. But in another direction conscious looseness is advisable. The federal principle cannot be constrained by the analogies appropriate to territorial governments operating in an inchoate international society. The principle is manifested in innumerable types of association. The basis of groupage need not be spatial. The element of federation may even be unintentional and implicit, resulting, on the one hand, from the inevitable interdependence of supposedly separate things or, on the other hand, from the nature of man's mind, which by dividing his attention and qualifying his loyalties imparts a vaguely federal character to all authority.

Traces of federalism are ubiquitous, but federation when deliberate implies relative sophistication. The exact limits of the history of federal government are a matter of definition, depending upon the differences which are conceived to exist between federations proper and confederations and between the latter and the leagues and alliances into which their looser forms almost imperceptibly merge. When the proponents of the Constitution of the United States sought historical support for what their sense of need prompted, they necessarily dealt in terms of still unfixed meaning with institutions which were imperfectly understood and in part legendary. They could point surely to no true analogy in past experience, but only to unions which were confederations in the sense that they emanated from and acted upon constituent governments and not with direct reference to individuals. This conception of the difference between confederations and federations has been generally accepted, although realistic analysis has increasingly recognized the fact that the distinction rests upon results rather than forms and can be read in the extent to which, whether by direct

or indirect methods, the decisions of the central authorities of a composite state within the field of their competence can secure certain and orderly compliance. The logical difficulty of divided sovereignty can be avoided (if, indeed, such escape seems profitable) by regarding a confederation as merely a comprehensive and cohesive form of international administrative union, whereas a federal system is regarded as a multiple government in a single state.

The Hellenic unions—the Boeotian, Aetolian, Achaean and in Asia Minor the Lycian leagues, not to consider early, slighter instances of something akin to federalism in Phocis, in Acarnania and in Epirus—cannot unqualifiedly be called mere confederations. They were sufficiently developed to warrant the application of the term federal to the period in the history of ancient Greece after the passing of both strict town autonomy and Macedonian empire and before complete subordination to Rome. E. A. Freeman remarks that the Achaean League in the years from 281 to 146 B.C. was “the first attempt on a large scale to reconcile local independence with national strength” and had given “to a larger portion of Greece than any previous age had seen, a measure of freedom, unity, and general good government, which may well atone for the lack of the dazzling glory of the old Athenian Democracy” (p. 553-54).

No other unions so definitely federal in texture seem to have existed until modern times. On the Italian peninsula the early urban leagues of Etruria and Latium were imperfect and impermanent. Later, Rome's sprawling empire involved quasi-federal elements, but they were negated by a theory which despite the flexibility of its conception of Roman citizenship had no room for the idea of a voluntary union of equals. Feudalism was vaguely federal, although the pattern of confederate government was largely concealed in personal relationships. The Holy Roman Empire, while fiefs were evolving into principalities and kingdoms, was a kind of confederation that lapsed into an even more ambiguous union. The defensive alliances of certain Italian cities approached but did not achieve thorough and lasting federation. The Lombard League, consummated in 1167, fell to pieces in 1183; at the end of the twelfth century a concert of Tuscan communities was arranged; but the passing of the Hohenstaufens withdrew the chief motive for such combinations. Economic purposes stimulated organizations among northerly cities like the Rhenish League in the thirteenth

century, the Swabian League in the fourteenth and the even more essentially economic union which, having developed from an association of merchants into a loose combination of corporate communities, long survived as the Hanseatic League. More important were the two loosely composite states which in the mountains and by the sea successfully threw off the grasp of a dynasty. The Seven United Provinces of the Netherlands doubtless lacked the cohesion entailed in the modern conception of federation, but in the first half of the seventeenth century the union could be counted the strongest Protestant force in Europe, and it endured until the wars consequent to the French Revolution. The system of perpetual treaties of alliance which grew into the Swiss Confederation, spreading by degrees from the agreement of three forest cantons in 1290, remained hardly more than a permanent league until it yielded to unitary government under French auspices. The interruption was temporary; the confederation was restored in 1815 and in 1848 was transformed into a federal government.

The emergence of national states was accompanied by political ideas more compatible with the logic of unitary than of federal constitutions. In Germany, however, the course of unification led through a series of unions which generated a stream of analytical writing, dating at least from Ludolph Hugo in 1661, which in its source was independent of the turgid controversies set in motion by the Constitution of the United States. The vestiges of the aged empire disappeared when the semi-independent Confederation of the Rhine was imposed by Napoleon in 1806. This yielded in 1815 to a confederation under the presidency of Austria, which lasted until the North German Confederation was engineered by Prussia in 1866. Meanwhile within the shell of the old the Zollverein illustrated how shadowy in practise may be the line between international administrative unions for particular purposes (in this case customs, currency and weights and measures) and comprehensive federations. The German constitution of 1871 did not quite end the debate as to whether a *Staatenbund* had not at last evolved into a *Bundesstaat*, while in another direction the disproportionate weight of Prussia sharpened the problem of the degree of inequality which is consistent with the genius of federation. The new plan of government in 1919, still ostensibly federal, gave a fresh turn to the discussion. So broadly did it empower the central

authorities of the union to establish principles and standards that, like Austria's contemporary constitution and the scheme of multiple organization consummated in the Union of Socialist Soviet Republics in 1923 (not to consider the abortive Chinese constitution of 1923), it raised the question of the point at which normative federalism ceases to be federalism at all. De Tocqueville truly said, speaking of federal government, that "the human understanding more easily invents new things than new words" (*Democracy in the United States*, 7th ed. Boston 1882, vol. i, p. 200).

A number of federations established in the nineteenth century drew inspiration from the United States, although the lesson learned was sometimes a lesson of avoidance. Those of Latin America—Mexico, Argentina, Colombia, Venezuela and Brazil—were most simulative. There were indigenous roots of decentralization contending with the heritage of the old colonial administration; but the introduction of federal government in these countries demonstrated that, in form at least, the latter is not always the result of a movement toward closer union. Federation in Canada in 1867 departed from the type set by the United States in numerous crucial respects, notably in reversing the arrangement of delegated and residual powers. Australia's union of 1901 was nearer to the pattern, and the problems of adaptation to changing conditions which it has faced have been most closely analogous to those of the United States.

The historical pattern of federation has entailed a formalized distribution of powers among central and local governments. As a natural consequence of the fact that most federal systems have evolved from looser unions or conditions of complete independence, it has been customary to partition the sum of possible powers by assigning certain of them to the common organs, limiting those of the constituent governments by exclusion only. The theory of federation can no longer insist that this mode of allotment is essential; the example of Canada and the instances of federalism implicit in the constitutional provisions by which certain states in the United States have sought to establish municipal home rule have sufficed to show that the arrangement can be reversed. This indeed is an outcome pointed to by the tendencies that are embodied in the federations established on the continent since the World War. In distinguishing true federalism from the deconcentration which, supported by the tradition of the local

choice of local authorities, exists in varying degrees in most unitary states, it is as proper as it is easy to say that in a federation the powers of the constituent governments, whether residual or enumerated, must be substantial. What this means, however, is not likely to be fixed. When defense was the paramount purpose of union, the spirit of federation seemed to require that the central government should be confined to the care of external relations. This rudimentary stage characterizes countless voluntary associations which are approximately federal in structure; government was soon carried beyond it. It is increasingly unrealistic to conceive of a federal division of functions in terms of the assignment of subjects as wholes. Each has phases appropriate to central and to local attention. Federal constitutions which disregard this fact are brought into conformance with it in the end, although tardily and imperfectly, by subterfuge, indirection and fertile adaptation.

The legal distinction between federations and decentralized unitary governments rests upon more mechanical considerations than the scope of the powers of the constituent members of federal systems. The method whereby such powers are allotted is crucial. A federal organization can hardly be said to exist if the allotment can be altered by ordinary legislation. On this ground the Union of South Africa (not to mention countries like Cuba, which are still further removed from the type) is commonly excluded from the list of federations. A written constitution seems to be a prerequisite of federalism, although it can be argued that a virtually federal structure is being created without one in the British Commonwealth of Nations. The relative difficulty of the amending process is a decisive factor in all conceptions of federation, but like the other criteria it cannot be standardized. The widely variant provisions for the amendment of federal constitutions indicate that a lenient view must be taken or the list of true federations would be a short one. It is not indispensable to the principle of federal equilibrium that amendments be submitted to the authorities of the member states or to their electorates or to the electorate of the union or to a constituent assembly. The amending power may be vested in the central legislative body, provided some unusual procedure (such as an extraordinary majority or repassage in successive sessions or both) is required. The constitution of Brazil can be changed by a two-thirds majority in the national legislature, as can the recent constitutions

of Austria (save in the case of a general revision) and of Germany, although the referendum can be invoked under certain conditions in the latter countries. In the Union of Socialist Soviet Republics unrestricted power to amend is given to the Union Congress of Soviets, which, however, may be regarded as a periodical constituent assembly. A considerable degree of fixity in the division of jurisdictions is undoubtedly an essential ingredient of federal government, but, on the other hand, adjustments are constantly necessary and undue inflexibility (such as has resulted in Australia from the combination of an unpliant court and a costly amending process) may weaken and even discredit the federal idea.

Judicial control like a written fundamental law has become an accepted corollary of the theory of federal equipoise. A court of last resort although it is almost inevitably an emanation of the central government has seemed the most practicable method of providing relatively impartial arbitrament. This plan has been developed in the United States and followed in Australia and in the federalized states of Latin America; it has appeared in Germany and Austria; it is being agitated in Switzerland, where judicial review (partly perhaps because frowned on by ideas that were a contagion from unitary states) has not been extended unequivocally to acts of the federal assembly. Canadian federalism has been exceptional in vesting the right of review in the judicial committee of the Privy Council, while Parliament holds the technical power of amendment; but whatever success has attended these expedients, which may be reassuring to Quebec, they are not examples for other federations to follow. Strictly speaking, it is equally improper to allow the policy shaping organs of the central and of the local governments to determine finally the scope of their competence. Actually in a day of great nations and pervasive commerce the assumptions in favor of strength and convenience have been so compelling that only the check on the action of constituent governments has seemed indispensable. The practise of judicial review in most places although ostensibly even handed has reflected this attitude.

The conception of federation which has been colored by the early example of the United States has tended to disapprove all non-judicial forms of control over the actions of member states as incompatible with the autonomy which should characterize the federal type of decen-

tralization. There were exceptions in the United States from the outset, of course, but they chiefly involved Congress, as in the consent required for the levying of tonnage duties by the states, and were relatively unimportant. The constitution of Canada mildly challenged the theory by providing for the central appointment of the titular heads of the provinces accompanied by a real although seldom used power of disallowance. The form of executive control known in Argentina and Brazil as federal intervention may be dismissed, at least when chronic, as belonging to the pathology of federalism. It would be empty pedantry, however, to rule out as inconsistent with federal ideals the numerous forms of direct legislative and administrative control over the actions of member states which have been provided in the federal constitutions of the continent. Such forms of control have been engendered partly by reliance upon indirect federal administration, which can no longer be regarded as a sign of imperfect federalism. Beyond that, however, they reflect the seemingly inevitable tendency to bring about union, if not unity, within every broad field of governmental concern. This tendency is more than nation wide; it has already given rise to a congeries of international administrative unions. In weaving relationships across geographical divisions the tendency in question is distantly related to so-called economic federalism; but, regardless of the use that various forms of the latter may presently serve in facilitating the devolution of vexing problems of control and the interest that it holds as part of a scheme of social reconstruction, it does not appear now as a substitute for territorial federation. In systems like that of the United States arrangements akin to indirect federal administration are being realized in numerous ways. It would miss the essence of the new relationships to say that they are an attempt to enlist the state governments as agents of Congress, for national administration will be found as frequently to serve as agent of the states. By such means, federal systems—compelled (as are all forms of government) to reconcile the claims of localism and functionalism—are contending practically with the difficulties which constitute, more than does embarrassment in external relations, the weakness of this type of organization: lack of uniformity, duplication, imperfect stimulation and grave impediments in equalizing the services of government in the face of an uneven distribution of taxable wealth.

The allocation of representation in federal legislatures has been the subject of much controversy and varying practise. The necessity of bicameralism has been urged on the ground that for self-defensive purposes the member states should be allowed to participate on an equal footing in the law making process and that to constitute a single chambered legislature on this basis might result in dissolving the union into something like a confederation. This theory was exemplified in the United States, in the federalized countries of Latin America, in Australia and in Switzerland. It is more applicable to the formation of the federal states, however, than to their operation. Bicameralism by opening the way for equal representation undoubtedly facilitates compromises which may be indispensable in allaying opposition to union. Subsequently in the face of a party system and especially where members of the upper house are directly elected the constituent states are not represented as such. The interests of the states as governmental entities are more likely to be efficiently reflected in a body to which representatives are sent by the state administrations. Such was the former German Bundesrat; such, on a vastly reduced scale, is the present Reichsrat, although confined to recommendations and the carefully guarded exercise of a suspensory veto. There is probably growing need in all federal systems for consultation with state authorities, but the mechanisms of association and conference are not dependent on bicameralism. To say this is not to belittle the political utility of a device like the Council of Nationalities in the binary structure of the Central Executive Committee and the presidium of the Union of Socialist Soviet Republics. It is a conclusion, furthermore, which leaves unsolved the underlying problem that inheres in any gross disparity in the strength of the component parts of a federal union, such as in the relation of Prussia to the other states of Germany or the city of Buenos Aires to the rest of Argentina. Little is gained by protesting that the spirit of federalism is violated where federal organization at least tempers a natural hegemony; and much may be lost by pushing too far an unreal principle of mathematical equality.

When applied internationally the verbiage of federation although instinct with noble promises is still used with little reference to the meanings it has acquired in the experience of modern states. The proposal for which such organizations as the *Union paneuropéenne* have

variously agitated, which Briand brought into official view in an address on September 5, 1929, and which was tentatively sketched in a series of questions sent in the following May to the European members of the League of Nations, mentioned a *lien fédéral*, urged that the political aspects of the European complex should be emphasized as a prerequisite to economic adjustments and indicated the need of a central committee and other machinery. Begging the question of the bearing on French policy of this particular embodiment of a prevalent idea (such as its possible use as a foil to the scheme of a German-Austrian customs union), it suggested that fuller federation may be approached by treaty woven tissues of confederation, integrating regionally the pronounced economic pluralism of the contemporary world.

In the almost limitless, incoherent and fluent fields of voluntary association the term federation has been used with excusable looseness. It is often merely a catchword, but its prevalence is significant, for it suggests how universal is the human need of solving the riddle of many in one and one in many. The federal form (which in such instances is usually better described as a confederation) lends itself admirably to the purposes of offense and defense, such as carrying on advertising, promoting legislation or conducting litigation—purposes which bear a distant analogy to the cooperative diplomacy and war or the propitiatory religious rites conducted jointly by early unions of tribes or communities. The objectives of composite organization, however, are frequently more complex administratively, more difficult or more vexing from the standpoint of balancing the competing claims of the parts. Federated charities, for example, experienced little difficulty in maintaining clearing house relations which facilitated specialization in case work; but the recent development of the method of financing semipublic undertakings through so-called community chests has increased the dependence of the member organizations upon the energy of central committees and has raised difficult problems in the allotment of funds.

Federation has been an obvious instrument of craft unionism and where labor organization has followed more industrial lines autonomous tendencies have usually been strengthened by philosophies impregnated with economic federalism. The effective conduct of collective bargaining has required regional federation on both sides, although (with some exceptions like the "system

federations" of the railroad shop crafts) this sense of the term federation is less familiar in the United States than in Great Britain. It is perhaps significant of tendencies inherent in federal organization that the American Federation of Labor, which at the outset was little more than the legislative agent of a group of unions retaining complete freedom of economic action, has assumed an increasingly active role in defining the jurisdiction of its members. Federations, once begun, must struggle endlessly for the order entailed by balance.

FEE SPLITTING, or the sharing of fees for professional services, is a widely prevalent practise. Its essence is the payment of a commission for the reference of work. The practice has been most common among lawyers and medical men, but has also prevailed to some extent in other fields, such as the dental and engineering professions. Fee splitting is to be found even among clergymen in the form of the "marrying parson" who pays a commission to marriage license officials or taxicab drivers who send or bring to him couples desiring to be married.

Fee splitting within the professions is of relatively recent origin. In the main the practise has followed the development of professional specialization. The fact, for instance, that dentists do not split fees as frequently as do physicians is not because of their moral superiority but because occasions to refer dental cases are rarer. A great deal of fee splitting also arises from the frequent dependence of professional men upon equipment or supply houses or other agencies of technological assistance. Opticians, druggists, laboratories, sanatoria and appliance manufacturers frequently make it profitable to physicians to send them business. Engineers split with contractors. The growth of fee splitting gives some indication of the extent to which the professions have adopted business methods and become pecuniarily minded, for in business the giving of commissions has been of long standing.

Fee splitting has become very prevalent in the loosely organized and theoretically unspecialized American bar. The division of fees—usually two thirds to the receiver and one third to the forwarder or referrer—is an accepted practise. If one law firm refers a client who wishes counsel relative to income tax matters to another law firm which specializes in this work, the latter usually sends the former one third of the fee. A lawyer in one state often sends a collection case to a lawyer in another state and frequently receives a portion of the fee. The division of the fee in this instance is even more common than in the former.

Fee splitting, except in so far as the division was based upon a sharing of professional responsibility or of legal services, has often been con-

demned by the American bar. The practise has been dubbed unethical because it was thought to savor of champerty (i.e. the purchase of litigation) and because it seemed to be a method whereby less competent lawyers might obtain practise despite their lack of qualifications. Within recent years, however, the bar's condemnation has generally faded into mild disapproval, and the practise does not now present a contentious issue. At the present time it is only the splitting of fees with laymen that is strongly denounced by bar associations. Fee splitting of this type commonly occurs when a collection agency refers a case to a lawyer. Under these conditions the lawyer who splits his fee is not only paying for business but is in effect employing the agency to solicit business for him, when by the canons of legal ethics he is not permitted to do so for himself. The division of fees with laymen has occasionally led to intolerable abuses, as in ambulance chasing. Fee splitting of this type has been held illegal in various states under the general powers of the courts to disbar for professional misconduct. In addition many states have passed penal legislation specifically aimed at the practise.

Fee splitting among physicians is of relatively recent origin; it was infrequent before the twentieth century. The practise is prevalent in France, Germany and some other European countries; in Paris it is said to be almost universal. The exact extent to which it prevails in the United States is not known; very rare in certain sections, it is very common in other sections, as was shown by an extensive investigation made by the Judicial Council of the American Medical Association in 1913. To the question whether fee splitting was justifiable 77.3 percent of those answering the council's questionnaire replied in the negative, 13.4 percent in the affirmative and 9.3 percent were doubtful. It is everywhere conceded that since then the practise has increased.

The most frequent type of fee splitting in medicine is the division of the surgeon's fee for an operation with the practitioner who referred the case. Since this violates the ethical code of the profession and is in some places illegal, it usually takes place underhandedly, and care is exercised to see that no evidence of the transaction exists. Occasionally subterfuges are employed; for example, a surgeon will ask the referring practitioner to act as his assistant during the operation. Important economic factors seem to make fee splitting of this kind almost inevitable under present conditions. The general

practitioner with a patient requiring an appendectomy controls a piece of business worth several hundred dollars. With surgeons competing for work there is every temptation for the one to exact and the other to offer a commission. Another factor is the relative overvaluation of specialists' services; a general practitioner may receive five, ten or twenty dollars for diagnosing a case of appendicitis, while the surgeon will receive a fee ten or twenty times as large for a relatively simple and mechanical operation. Fee splitting undoubtedly tends to encourage the performance of unnecessary operations and increases the number of unnecessary consultations, laboratory tests and other medical services. One of its worst features is the inducement to auction off the patient to the highest bidder, who may be the most poorly qualified, a course of action which violates the trust which a patient puts in his physician. Because of the lack of legal control over the specialties and the absence of satisfactory postgraduate facilities, many incompetent, unqualified specialists are now in practise, and these men gain work through fee splitting which they would not be able to obtain under other conditions. Undoubtedly fee splitting tends to increase the cost of medical service to the public.

The question of fee splitting engenders much emotional heat among physicians. Specialists who refuse to divide fees and see inferior men waxing fat by so doing are not able to view the matter with Olympian detachment. Similarly, the general practitioner who again and again has refused a handsome bonus has definite views about the odiousness of the practise. The present situation makes for hypocrisy and demoralization. Few men will admit publicly that they split fees, yet many of those who in the meetings of their societies rant most furiously against the evil split fees in private. Certainly few men have been expelled from medical associations for fee splitting.

In view of the failure of attempts to stop fee splitting it has been proposed that the best way to resolve present difficulties is to legitimize the practise and to standardize the division of the fees. This would undoubtedly clear the atmosphere and would reduce and perhaps stop the tendency to send work to poorly qualified or incompetent men simply because they offer a split or a higher split, but it would still leave untouched such objections as that the practise increases the cost of medical service and encourages unnecessary surgery. Group medical

practise and the socialization of medicine have also been advanced as solutions of the problem.

Legislation to prohibit fee splitting in medical practise has been passed in twelve states: Iowa, Kansas, Kentucky, Michigan, Minnesota, South Dakota, Tennessee, Virginia, West Virginia, Wisconsin and Washington. The statutes of Virginia and Wisconsin prohibit fee splitting "between physicians and surgeons," so that presumably they would not apply to splitting with laymen. The South Dakota statute only makes the "giving" of the part of the fee unlawful. Six of the statutes, those of Iowa, Kansas, Kentucky, Nebraska, Tennessee and West Virginia, make the fee splitting unlawful only when done without either the knowledge or consent of the patient. Revocation of license is provided in all states but in some it is compulsory only after the second conviction.

J., "The Problem of Fee Splitting" in *Medical Journal and Record*, vol. cxxviii (1928) 221-22; Taesch, C. F., *Professional and Business Ethics* (New York 1926) p. 233-41.

FEIJÓO Y MONTENEGRO, BENITO JERÓNIMO (1676-1764), Spanish scholar. Feijóo became a member of the Benedictine order at an early age and spent most of his life as a teacher at the University of Oviedo. He achieved fame as a prolific writer on the most diverse subjects and in spite of his obvious defects and superficiality possessed an erudition difficult to surpass. A representative figure of his period, Feijóo devoted his critical faculties to fighting vigorously against the prevailing ignorance and superstition and against national and social prejudices. He introduced to his countrymen the rationalist ideas of the eighteenth century and strove to bring Spain into the contemporary cultural movement which had begun in France. He was frequently attacked by the traditionalists, who accused him of being dominated by foreign ideas and reproached him particularly for his Gallicisms. He was supported, however, by King Ferdinand vi.

His series of essays entitled *Teatro crítico universal* (9 vols., Madrid 1726-41; new ed. 1781;

selective ed. by A. Millares Carlo, 3 vols., 1923-25) and *Cartas eruditas* (5 vols., Madrid 1742-60; new ed. 1781; selective ed. by A. Millares Carlo, 1 vol., 1928) deal with mathematics, the various sciences, philosophy, theology, history, literature and aesthetics. Feijóo's rationalism was limited by his religious convictions, which often prevented him from carrying his ideas to their logical conclusion in his critical works. In his philosophy he was greatly influenced by the doctrines of Bacon and Newton and especially by those of Vives, whose educational ideas inspired him to advocate a number of educational reforms. Through his writings he was instrumental in awakening the interest of the Spanish people in scientific study and in the inductive method in teaching.

FELLENBERG, PHILLIP EMANUEL VON (1771-1844), Swiss educator. Fellenberg was the son of a successful jurist of noble family. After a short political career, during which he tried to rally the peasantry against invading French revolutionary forces, he turned to educational work. He planned to create an educational republic, a closely coordinated combination of educational institutions which would be a model for a complete national or even universal educational system. This was to include schools for boys and girls of various ages and all classes, with their focal point in a model farm on his estate, Hofwyl, near Berne. The grouping of institutions was to develop a common national and international consciousness through early interclass contact, and each class was to be trained for useful pursuits by productive labor at school. A charity agricultural school was established in 1804; Pestalozzi was for a short time associated with it, and from 1810 to 1833 it was directed by J. J. Wehrli. Another charity school trained handicraftsmen. There were also a vocational school for the urban bourgeoisie and a literary and scientific school for upper class children, which was for a while combined with a higher agricultural institute. Normal courses to train public school teachers in his methods

were organized but failed because of government opposition to private enterprise of such nature. A follower of physiocratic theories, Fellenberg regarded farming as the center of economy and education; he introduced the English four and eight-field system, organized agricultural exhibitions and improved farm implements.

Fellenberg was not an original thinker. He was the product of such influences as Rousseau's *Émile*, Gregoire's Paris lectures on education, Kantian philosophy, Pestalozzi's educational methods, which he did not quite grasp, Rochow's attempts to link education with agriculture, Thae's agricultural writings, but above all of his parents' humanitarian cosmopolitanism. He was typical of the Enlightenment with its hope for a rebirth of humanity through the systematic education of a new species of man. Being a forceful personality and a brilliant organizer, he was able to build up his institutions with the aid of skilled teachers, but after his death his work fell to pieces. Nevertheless, he had international influence. Children of wealthy families from all countries came to Hofwyl, and his system of combined farm work and education was copied widely in both Europe and America.

FELS, JOSEPH (1853-1914), single taxer. Fels was a successful Philadelphia soap manufacturer who devoted his later years to land reform. Beginning near home with vacant lot gardening he went on in England to costly experiments in farm colonies for unemployed and small holdings for men of small capital. Finding that every improvement in his own men's holdings drove up the price of adjacent land and made further expansion more costly, he concentrated his efforts upon what he had long believed in theoretically, the taxation of unimproved land values.

In 1905 Fels proclaimed himself a follower of

Henry George. "The great God-denying crime of society," he wrote, "is [that] men are permitted to put into their pockets . . . the community-made values of land." Increasingly he spoke, wrote, traveled, lobbied and interviewed for the single tax. In 1909 he established a foundation for single tax propaganda in America, the Joseph Fels Fund Commission, and he gave generously to the movement in other countries. Fels' immediate aim, to put the single tax into effect somewhere as an object lesson, failed, but his efforts transformed the movement for a time from a relatively academic to an active one.

Fels was also an active supporter of the Jewish Territorial Organization, hoping to test his economic theories in the Jewish pioneer colony which it planned to establish.

FÉNELON, FRANÇOIS DE SALIGNAC DE LA MOTHE (1651-1715), French prelate, author of numerous political, pedagogical and theological works. A member of an old and noble family of Quercy, Fénelon took orders immediately upon leaving Saint-Sulpice in 1675 and in 1689 was appointed tutor to the duke of Burgundy, grandson of Louis XIV. The high position which he thereafter enjoyed at the French court was, however, forfeited as a result of his support of Madame Guyon's mystical religious doctrines, known as quietism, and of his impassioned controversy with Bossuet on the subject. In 1697, two years before the papal court formally condemned his position, he was ordered by Louis XIV to retire to the diocese of Cambrai, of which he had been appointed bishop in 1694. There he remained in virtual exile for the rest of his life. But the ascendant influence which he had exercised over his pupil persisted; and in the hope that Burgundy would some day occupy the throne he continued to work out what he conceived to be the principles of just government. His plans were forestalled by the death of the duke in 1712.

Fénelon's influence upon subsequent French thought was tremendous. The *philosophes* of the eighteenth century saw in him a precursor of their own political ideas. In taking such a view they credited him with a religious tolerance which he hardly possessed and ignored the reactionary framework upon which his ideas were hung. No less than Bossuet he subscribed to the

divine right of kings. Moreover, being a great admirer of antiquity, particularly of the Greeks, and a man whose political, ethical and aesthetic notions were intimately interwoven, he was haunted by the idea of a return to the simple forms of primitive life, to the world of *Télémaque*. The point at which he coalesced with the *philosophes* lay in his antipathy to the system of Louis XIV and in the practical policies which he advocated as a reaction from that system. Besides *Télémaque*, the famous pedagogical novel which he wrote for the purpose of instructing the duke of Burgundy in the ethics of governing, his political ideas are contained principally in *Tables de Chaulnes*, which represents a summary of his conversations with the duke of Chevreuse in 1711, *Dialogues des morts*, *L'examen de conscience sur les devoirs de royauté* and *An Essay upon Civil Government*, which is a report of his conversations with the Old Pretender committed to writing by the Scot Ramsay (London 1732). In these works he reveals himself to be an aristocrat by tradition and a friend of the humble by sentiment. The government he depicts is a monarchy sharing its powers with the nobility, loving peace no less than Louis XIV loved war, practising economy, solicitous for the public welfare, hostile not only to luxury but (once more in reaction from Louis XIV and Colbert) to industry. (For further elaboration of Fénelon's political views, see volume 1, Introduction 1, RISE OF LIBERALISM, p. 117.)

In pedagogy Fénelon's theories represent a foreshadowing of Rousseau. They are most clearly presented in a pioneer treatise on female education, *Traité de l'éducation des filles*, which Fénelon wrote for the duchess of Beauvillier in 1681, several years before the foundation of Saint-Cyr. In the age of the *précieuses ridicules* on the one hand and of the utterly uninstructed woman on the other Fénelon presented the idea that women should be educated for the role they are to play in the family and in society. Their education should therefore be pleasurable, concrete and aesthetic; Fénelon assigned an important place to drawing and object lessons. He insisted that education should develop rather than repress nature. No less characteristic than his emphasis upon nature was his conviction that education must be subordinated to a lofty Christian ideal. It was this last principle especially which was his guide throughout his tutorship.

Fénelon's religious doctrines, centering about the idea that effusions of pure love for the divinity

rather than solicitude for personal salvation constitute the essence of faith, were submerged in the immediately succeeding generations by an official Catholicism which echoed the voice of Bossuet and by the prevalent antireligious sentiment. Nevertheless, despite a certain lack of clarity in his doctrines the vitality which they have retained has been largely responsible for the persistence of the mystical current in French thought. The religious renaissance under Rousseau and Chateaubriand had indeed been silently prepared by the condemned quietism of Fénelon. In estimating the extent to which Fénelon anticipated later thought or movements his views on history must not be overlooked. The *Lettre à l'Académie Française*, which he designed chiefly as a vehicle for his aesthetic ideas, develops the theory that the materials of history are to be found in social and political institutions, in customs and in manners. At once positive, philosophic and dramatic, his conception recalls Michelet.

FÉNYES, ELEK (ALEXIS) CSOKAJI (1807-76), Hungarian statistician and geographer. Fényes' work not only served as the foundation for subsequent statistical, economic and geographic studies of Hungary but was a unique contribution to the cause of Hungarian nationalism both prior to and after the struggle of 1848. Because of the fact that Hungary's fiscal, economic, educational and military affairs were directed from Vienna by the imperial Austrian government Hungarian national leaders lacked the information necessary for the achievement of their ideals of independence and for social and economic reform. This Fényes supplied in his many descriptive and statistical works on the economic and social resources of Hungary. Beginning with the only source available, the figures for 1830 for those counties which for centuries had enjoyed local autonomy, Fényes with great resourcefulness turned for valuable supplementary material to the communal registers of the Roman Catholic dioceses. He was able to show how imperfect were any conclusions as to national origins drawn on the basis of religious affiliations and he compiled probably the first occupational and industrial statistics available.

His first work, published in six volumes from 1836 to 1840, received the recognition of the Hungarian Academy of Sciences, and upon the formation of the Hungarian ministry of 1848-49 he was entrusted with the task of organizing a central statistical bureau. The defeat of the revolution forced him to retire from public life, and although barred thereafter from new sources he used his original data for several additional studies, showing among other things the defects of official Austrian statistics. His geographical dictionary, published in four volumes in 1851, remained for decades the most complete of its type.

In both structure and content Fényes' works reflect the influence of the Achenwall school, with its emphasis on all inclusive descriptive material to be used as the basis for the formulation of national policy. Nevertheless, he stressed the development of statistics as a separate science.

FERDINAND V and ISABELLA, Spanish rulers. The marriage of Isabella of Castile (1451-1504) and Ferdinand of Aragon (1452-1516) took place in 1469. Five years later Isabella succeeded to the throne of Castile and in 1479 her husband became king of Aragon. The existence of a personal union between the sovereigns, however, did not bring with it the political unification of their states. Castile as well as Aragon maintained its independent organs of government, and the subjects of each kingdom regarded those of the other as foreigners. This attitude persisted even in regard to the newly discovered American territories, which were politically united with the crown of Castile. After Isabella's death in 1504 the separation between the two states became even more patent, although from 1507 until he died Ferdinand was regent of Castile. The dynastic union was accordingly not consolidated until the reign of Charles I, the grandson and successor of Isabella and Ferdinand; even then the internal political organization as well as the intellectual life of the two states remained distinct.

Despite the lack of union between the two kingdoms, however, the marriage of Ferdinand and Isabella created important political changes. It formed the solid basis for a new type of state which permitted the king to realize his imperialistic ambitions. These found their legal backing in the doctrines derived from the Roman law, which at that time carried great weight throughout civilized Europe. Spain was thus the first country in Europe to evolve into a national state, and it soon developed from a poor and backward mediaeval country into the leading European power.

In Spanish history the rule of Ferdinand and Isabella represents the transition from the Middle Ages to the modern period. The sovereigns found themselves with a powerful instrument of government and they employed it to its full advantage. The keynote of their rule was the establishment of royal authority. This they effected by pacifying the country, by subduing the nobility and reducing their power and by various administrative reforms. Absolutism became firmly entrenched. Municipal autonomy, already on the decline in the late Middle Ages, was virtually destroyed. The Cortes was rarely convened and when it sat was definitely under

royal domination. A thoroughly centralized government was organized, resulting in an excessively bureaucratic system at the head of which were the supreme councils and the secretaries; the latter and the councilors were generally educated men of the middle class. The economic policy which was introduced was strongly protective and favored commerce, industry and cattle raising rather than agriculture.

The initiation of a policy of religious intolerance brought about the expulsion of the Jews in 1492 and of the Moors in 1502, while the converts suspected of heresy were persecuted by the Inquisition. The international authority of the pope was respected in the matter of the line of demarcation separating the Spanish and Portuguese possessions. Within Spain, however, the prerogatives of the crown were strictly upheld against the claims of the church.

Royal policy was favorable to the contemporary intellectual renaissance, which was distinguished particularly by the cultivation of humanism. During Ferdinand's reign Jiménez de Cisneros founded the University of Alcalá de Henares.

In their foreign policy Ferdinand and Isabella successfully followed the traditional anti-French policy of Castile and Aragon. Aragon strengthened her hegemony over the Mediterranean by defeating the French in Italy. Granada was taken by Castile in 1491. The plan of the sovereigns to unite the Spanish peninsula through the marriages of their children failed, however. Portugal maintained its independence, and Ferdinand did not succeed in conquering Navarre until the end of his reign. During the reign new enterprises were undertaken of a scope hitherto undreamed of; such was the discovery and colonization of America. The sovereignty of Castile was firmly established in the Canary Islands and the north African cities were forced to accept Spanish dominion.

All the virtues as well as the defects of modern Spain existed in embryonic form in the reign of the two monarchs.

FERGUSON, ADAM (1723-1816), Scottish social philosopher. At the University of Edinburgh Ferguson occupied the chair of natural philosophy from 1759 to 1764 and that of pneumatics and moral philosophy from 1764 to 1785. His ability as a lecturer and his forceful and well organized restatement of certain recently formulated points of view gave him an outstanding position among the distinguished Edinburgh group, which included Hume, Smith, Robertson and Stewart. His writings although falling far short of an original, fully rounded system led Gumpłowicz to regard him as the first sociologist, the author of "the first natural history of human society." Ferguson's chief significance perhaps is due to the prominent part which he played in divorcing philosophy from the prevailing rationalistic *a priori* approach and in substituting the inductive, historical method. Recognizing subrational drives as the mainsprings of human action he portrayed societal evolution as the aggregate of countless unpredictable forces which could not be reduced to a philosophical system. His realistic mind, colored by Hume's skepticism and Montesquieu's sense of relativity, was impelled by an intensive if limited study of history and anthropology to repudiate the orthodox contract theory as well as the quietistic implications of the state of nature postulate. Passive enjoyment of individual rights promotes dissension, active achievement union. "Man is by nature a member of society"; his emotions are conditioned by the social environment in which his habits are formed. Self-realization in social activity; restless striving after perfection, which "consists . . . in being an excellent part of the system to which he belongs"; division of labor not only in industry but throughout the entire structure of society and the state; conflict in commerce and war—these are the forces, the active principles, which make of society an integrated organism and which help to relate the individual and the species in an intimate functional unity. This interrelation and unity Ferguson finds not only in a cross section of a given static society but also—with a sense of historical continuity akin to Burke's—between succeeding

generations and periods of history. To an examination of the evolutionary factors of continuity and of change he devotes his most penetrating analysis, careful always to avoid any suggestion of abstract progress as it had come to be apotheosized by so many of his contemporaries.

FERNALD, WALTER ELMORE (1859-1924), American psychiatrist and educator. Fernald was for thirty-seven years superintendent of the Massachusetts State School for the Feeble-minded. When he began his study of mental deficiency in 1887 little interest was shown in the subject by social workers and educators. Largely because of the influence of his statistical and interpretive studies legislation was enacted in Massachusetts and in other states establishing additional schools for the feeble-minded and special provisions for the defective delinquent, making mandatory the establishment of special classes for the mentally defective in the public schools, requiring a census and registration of the feeble-minded, establishing clinics for the examination of retarded school children, permitting parole of the feeble-minded and initiating inquiries on the mental status of prisoners. Through his educational work Fernald showed that the feeble-minded child may be educated to the point of social usefulness when the tasks given him are graded in accordance with his capacity. Fernald's efforts to develop a suitable curriculum led him to prepare the first program for the standardization of the teaching of manual labor according to the intellectual levels. Although he used the Goddard and Terman revisions of the Binet-Simon tests he was not convinced that psychological tests gave an accurate picture of the entire personality of the child. He maintained that for a satisfactory rating knowledge is required of the child's family history, personal and developmental history, psychologi-

cal rating, school progress, his response to the school test, his practical knowledge, economic efficiency, social history and traits, moral reactions and general physical condition. His program for state control of mental deficiency comprised the identification, registration, education, supervision and segregation of mental defectives.

FRANKWOOD E. WILLIAMS

FERNÁNDEZ NAVARRETE, PEDRO, Spanish economist of the late sixteenth and the early seventeenth century. Fernández Navarrete was chaplain of the court of Philip III and an officer of the Inquisition. In *Conservación de monarquías* (Madrid 1626, 5th ed. 1805), his chief work, he amplified the remedies for economic decadence which Diego Corral y Arellano had formulated in 1618 at the request of the Council of Castile. To replenish the population, depleted by colonial emigration and the expulsion of religious dissenters, and to revive decadent agriculture and languishing industry he advocated internal freedom of the grain trade, the exemption of peasants' sales from legal maximum prices, rewards for marriage, the immigration of foreign Catholic artisans and technical schools for the instruction of orphans in navigation and mechanical trades. He opposed liberal education in rural districts, the extension of mortmain, the importation of foreign manufactures and the further expansion of the Spanish Empire. He also disapproved of high taxes, extravagance in government, luxury in the royal household, the congregation of courtiers in Madrid and the indiscriminate giving of alms.

As an economic theorist Fernández Navarrete has little claim to distinction beyond his anticipation of the later mercantilist differentiation between natural and artificial wealth. Although he recognized that the effect of specie imports upon prices obstructed the indefinite accumulation of treasure and specifically stated that national prosperity depended upon an abundance

of commodities, particularly agricultural, Fernández Navarrete shared the prevailing mercantilist prepossession in favor of gold and silver.

FERNOW, BERNHARD EDUARD (1851-1923), American conservationist. Fernow was born and educated in Germany and served in the Prussian forest service. In 1876 he came to the United States, where about 1882 he assumed the leadership of the incipient forestry movement. From 1886 to 1898 he was chief of the Division of Forestry in the United States Department of Agriculture. Subsequently he was occupied with the introduction of technical forestry education into the United States and Canada and with its administration. His educational and propagandistic activities and especially his direction of the scientific work of the United States forest service in the interests of timber users won the support for conservation which permitted its elaboration into a political movement by Pinchot and Roosevelt. Fernow led the forestry movement away from the sentimentalism which failed to understand the historical and utilitarian factors leading to the destructive work of the pioneer and which advocated the legal prohibition of the cutting of timber; he urged that concrete measures be undertaken to guarantee a sustained supply of specifically useful woods to meet the increasing demand which he anticipated. Restriction of the private operator he held to be impractical because of unrestrained competition, inadequate fire protection, ignorance of technical matters and American tradition, and he regarded the subsidizing of private enterprise as a demonstrated failure. He believed that the large amount of capital required and the necessarily long delay in return made the practise of forestry suitable only to large corporations and to governments and that government activity should be largely fire protection, education and exemplary administration of its own timberlands. He is chiefly responsible for the basic forestry legislation of the United States, enacted in 1891 and 1897, which provided for the creation of forest reservations out of lands in the public domain, for their protection and administration and for the regulated

sale of timber. Directly or indirectly he influenced much forestry legislation of the American states and of the Canadian dominion and provinces.

MAX LEVIN

Important works: *Economics of Forestry* (New York 1902); *A Brief History of Forestry* (New Haven 1907, 3rd ed. Toronto 1913).

Consult: Roth, Filibert, "Great Teacher of Forestry Retires" in *American Forestry*, vol. xxvi (1920) 209-12, and articles on Fernow by F. Roth and others in *Journal of Forestry*, vol. xxi (1923) 305-48, with bibliography; Cameron, Jenks, *The Development of Governmental Forest Control in the United States* (Baltimore 1928) p. 196-214.

FERRARA, FRANCESCO (1810-1900), Italian economist. Ferrara was director of the Direzione Centrale della Statistica de Sicilia and founder of *Giornale di statistica*. He was a political prisoner in 1848 and later collaborated in Cavour's *Risorgimento*. He was also chief editor of the *Biblioteca dell'economista* (ser. i-ii, 1850-68) and professor of economics at the University of Turin, member of Parliament, minister of finance and senator in the United Kingdom of Italy and director of the Scuola Superiore di Commercio in Venice. His theories are closely related to those of his contemporaries Carey and Bastiat. Like Jevons later on Ferrara stressed the anti-Ricardian note, but his theory while more abstract than that of the English classical school is not inconsistent with it. He recognized utility along with reproduction cost as a determinant of value, reduced all concrete economic phenomena to value problems and emphasized the unity of the economic system. Pareto said of him: "Had he but given a mathematical form to his reasonings, he would have achieved the exactness of the theories that have as their basis the consideration of ophelimity" (*Cours d'économie politique*, 2 vols., Lausanne 1896-97, vol. ii, p. 101). Ferrara's views had a wide vogue in Italy and have recently begun to exert an international influence through the writings of Pantaleoni, Pareto and their followers. Ferrara's prefaces to the issues of the *Biblioteca dell'economista* have been incompletely collected as *Esame storico-critico di economisti e dottrine economiche del secolo XVIII e prima metà del XIX* (4 vols., Rome 1889-90).

FERRARI, GIUSEPPE (1812-76), Italian social philosopher. Ferrari's doctrines evolved under the influence of Romagnosi's teaching, of the study of Vico and of the friendship which he formed with Proudhon during his voluntary exile in France from 1837 to 1859. An uncompromising skeptic in metaphysics, Ferrari followed Romagnosi in developing phenomenalism. For him as for Romagnosi the intellect could serve effectively only sociological and historical problems; that is, the problems of man in action. All of Ferrari's works were at once doctrinal and controversial from his early studies on Romagnosi (1835) and on Vico (1837) through the minor writings on revolutions and reforms to the more important volumes beginning with *Filosofia della rivoluzione* (2 vols., London 1851; 2nd ed. Milan 1873). In the *Filosofia*, which contains the most complete exposition of his philosophical system, he showed that while metaphysics is no more than a succession of antinomies, the life which dominates these contradictions and the necessity of liberty and equality are affirmed independently of logic as natural revelations. But it is only by struggle that these can be carried over into law. Struggle will resolve the conflict between liberty, which begets property, and equality, which presupposes communism, by giving birth to the agrarian law. Struggle will free Italy from the power of the Catholic church; it will realize the acme of attainable political liberty by uniting the Italian people into a republican federation. Ferrari's federalistic ideal of unification was set forth at length in *La federazione repubblicana* (London 1851). In part a reflection of Proudhonism and in part the result of his admiration for the constitution and religious freedom of the United States, it was also, as he thought, a deduction from the teaching of all history, both Italian and foreign. On the eve of the uprising of 1859 Ferrari reiterated in his *Histoire des révolutions d'Italie* (4 vols., Paris 1858; tr. into Ital-

ian, 3 vols., Milan 1870-73) the idea that revolution is *rinascita* and not *distruzione*. After returning to Italy in 1859 for the immediate purpose of combating Cavour's conception of unification Ferrari became increasingly absorbed in the philosophy of history. The deterministic view expressed in *Histoire de la raison de l'état* (Paris 1860) was systematically expounded in *Teoria dei periodi politici* (Milan 1874). Here he sought to demonstrate that successive principles have been at work in history, each surviving for a "century" of one hundred twenty-five years and passing through four phases: preparation, efflorescence, reaction and dissolution. In a series of lectures delivered at the R. Istituto Lombardo di Scienza e Lettere in 1874-75 (published in the *Rendiconti* of the Istituto, 2nd ser., vol. viii, 1875, and vol. ix, 1876) he stated the principles of an "arithmetic of history." This mechanization of history was the weakest part of his work, as his theory of revolution when considered in its bearing upon the Risorgimento was the most significant.

RODOLFO MONDOLFO

Other works: *Corso sugli scrittori politici italiani* (Milan 1862); *L'Italia dopo il colpo di stato del 2 dicembre 1851* (Capolago 1852); *La Chine et l'Europe* (Paris 1867, 2nd ed. 1868).

Consult: Mazzoleni, A., *Giuseppe Ferrari* (Milan 1877); Nicoli, P. F. G., *La mente di Giuseppe Ferrari* (Pavia 1902); Gentile, G., *Le origini della filosofia contemporanea in Italia*, vols. ii-iii² (Messina 1917-23) vol. i, p. 11-43; Ferri, L., *Essai sur l'histoire de la philosophie en Italie au dix-neuvième siècle*, 2 vols. (Paris 1869) vol. ii, p. 229-49; Croce, B., *Storia della storiografia italiana nel secolo decimonono*, 2 vols. (Bari 1921) vol. ii, p. 115-20.

FERRARIS, CARLO FRANCESCO (1850-1924), Italian statistician, economist and jurist. He was graduated from the University of Turin and completed his studies in economics in Germany and England. From Germany he introduced into Italy the science of social administration and in 1878 he occupied the first chair of this discipline in Italy at the University of Pavia. In 1885 he went to the University of Padua, where he first taught statistics and later until his death administrative law. He was a member of the Chamber of Deputies and in 1905 became minister, in which capacity he made preparations for the transfer of Italian railways from private to state operation. Later Ferraris became a member of the Senate, where he was highly regarded for his competence in financial matters.

His scientific works are in statistics, econom-

ics and law. He was the first to apply the statistical method to economic problems in Italy. His economic works combine deductive and statistical methods and deal principally with monetary problems. His works on bimetallism, the Latin Union, the production of precious metals and the premium on gold are of great value. His work on the war indemnity levied upon France by Germany in 1871 exhibits an excellent use of the inductive method as applied to the study of the effects of international transfer of capital on the balance of payments and the rate of exchange of the countries concerned. In a controversy with Professor Loria he wrote a scholarly volume on historical materialism, in which with the aid of numerous historical facts he attacked the materialistic interpretation of history. Jurists appreciate the value of his studies on administrative law, principal among which are *L'amministrazione locale in Italia* (2 vols., Padua 1920) and the *Diritto amministrativo* (Padua 1922-23). Although his doctrines may have been somewhat superseded, his works are still of importance because they furnish a complete picture of the Italian administrative organization immediately preceding the Fascist revolution.

MARCO FANNO

Chief works: *La rappresentanza delle minoranze nel parlamento* (Turin 1870); *Moneta e corso forzoso* (Milan 1879); *Saggi di economia, statistica e scienza dell'amministrazione* (Turin 1880); *Principii di scienza bancaria* (Milan 1892); *Il materialismo storico e lo stato* (Palermo 1897, 2nd ed. 1897).

FERREIRA, SILVESTRE PINHEIRO. *See* PINHEIRO FERREIRA, SILVESTRE.

FERREIRA BORGES, JOSÉ (1786-1838), Portuguese economist and jurist. Ferreira Borges studied law at the University of Coimbra and was a practising attorney at Oporto from 1808 until 1820. Subsequently he held several state offices, but in 1823 he was forced to emigrate because of his activities in the constitutional movement. He lived in London until 1827 and again from 1828 to 1833. Upon his return to Portugal in 1833 he was appointed chief judge of the Court of Commerce. He was the author of the *Codigo commercial portuguez* of 1833, known as the Commercial Code of Ferreira Borges and which served as the commercial law of the country for almost fifty-six years.

Ferreira Borges was also a very learned and influential economist. His study of finance, entitled *Princípios de syntelologia* (London 1831), was inspired by Parnell's writings and was the first systematic study of finance in Portugal. It was divided into two parts, of which the first dealt with the theory of taxation, direct and indirect taxes and other public revenues, public credit, public loans and the national budget; the second part discussed public expenditure. His *Instituições de economia política* (Lisbon 1834), although not the first Portuguese compendium on the subject, was the best systematic work on economics published in Portugal at that time. The various sections dealt with the foundations and the utility of economics, the production, accumulation and distribution of wealth, and money, credit and consumption. The book reflected the ideas of Storch particularly, but also of Lauderdale, Malthus, Ricardo, John Stuart Mill, Bentham, Hennessey, Say, Tracy and others. The *Instituições* gave a strong impetus to the study of economics in Portugal; two years after its publication a chair of economics was created at the University of Coimbra.

MOSES BENSABAT AMZALAK

Chief works: *Diccionario juridico commercial* (Lisbon 1835, 2nd ed. Porto 1856); *Instituições de direito cambial* (London 1825, 2nd ed. 1844); *Jurisprudencia do contracto-mercantil* (London 1830); *Synopsis juridica do contracto de cambio maritimo* (London 1830); *Das fontes especialidade e excellencia da administração commercial* (Oporto 1835); *Do banco de Lisboa* (Lisbon 1827).

Consult: Laranjo, Frederico, in *Instituto*, vol. xxxii (1884) nos. v-vi; Francisco da Silva, Inocencio, in *Archivo pittoresco*, vol. ii (1859); Rebello da Silva, L. A., *Varões illustres das tres epocas constitucionaes* (Lisbon 1870).

FERRI, ENRICO (1856-1929), Italian criminologist. Ferri was, with Cesare Lombroso and Rafael Garofalo, the originator of the positive school of criminology, which has caused penal law to take cognizance of the results of the biological and social sciences and has affirmed the necessity of first studying the person who commits crime and the medium in which he commits it and only afterwards studying juridically the crime committed. After his conversion to socialism he ascribed to economic factors directly, or indirectly through heredity, a decisive role in the genesis of the crime. He also called attention to the necessity of supplementing the Darwinian point of view, by which Lombroso and Garofalo justified the death penalty, by the Lamarckian, which emphasized

the possibility of readaptation to the environment and favored the application of correctives to the delinquent. He propounded the doctrine of penal substitutes, according to which the legislator should supplement the repression of crimes with attempts at their prevention. As professor of penal law in Rome and visiting professor in various European and South American universities, as author of *La sociologia criminale* and as editor of the review *Scuola positiva* Ferri exercised a commanding influence upon the criminology and legislation of Latin Europe and South America, in the latter continent particularly after his visit to Argentina, whose penal code compiled in 1921 attests his influence. He presided over the labors of a commission which drew up a plan for an Italian penal code in 1921 in which the positivist theories triumphed. Its most outstanding innovation was the rejection in principle of the definition and penalty relative to each of the judicial forms of crime (e.g. theft, homicide, rape), subordinating repression of crime to the determination of the categories of delinquents (instinctive, insane, emotional, occasional and habitual). The plan was abandoned when the Fascist reaction occurred.

In the field of general sociology Ferri associated Spencer's views with the historical materialism of Marx. In his book *Socialismo e scienza positiva* he endeavored to demonstrate the thesis that Marx complemented Darwin and Spencer and that the three men constituted the great scientific trinity of the nineteenth century.

In his political activity he worked with the Socialist party and was for a long time editor of the socialist daily *Avanti*. At the end of his life, old and infirm, he assented to Fascism.

C. BERNALDO DE QUIRÓS

Works: Ferri's principal works on criminology include: *I nuovi orizzonti del diritto e della procedura penale* (Turin 1881, 2nd ed. Bologna 1884), superseded by *La sociologia criminale* (Turin 1884; 5th ed. by A. Santoro, 2 vols., 1930), tr. from 2nd French ed. by J. I. Kelly and John Lisle (Boston 1917); *L'omicidio*, 2 vols. (Turin 1895, 2nd ed. 1925); *L'omicidio-suicidio* (Rome 1884, 5th ed. Turin 1925); *I delinquenti nell'arte* (Genoa 1896, 2nd ed. Turin 1926); *Studi sulla criminalità* (Turin 1901, 2nd ed. 1926); *Difese penali studi di giurisprudenza penale* (Turin 1899; 3rd ed., 3 vols., 1925); *Principii di diritto criminale . . . in ordine al codice penale vigente, progetto 1921, progetto 1927* (Turin 1928), incorporating the Italian text of *Progetto preliminare di codice penale italiano* (official publication by Commissione Reale per la Reforma delle Leggi Penale with English, French and German versions, Milan 1921); *Conferenze di Enrico Ferri nella repubblica Argentina*, compiled by Folco Testena (Buenos Aires

1911). The last editions of works, with the exception of the *Conferenze*, represent a final revision prepared by the author.

Ferri's writings on socialism and politics include: *Socialismo e scienza positiva* (Rome 1894), tr. by R. R. La Monte (New York 1900); *Mussolini, uomo di stato* (Mantua 1927), tr. by A. Caporale (Philadelphia 1927); *Il fascismo in Italia e l'opera di Benito Mussolini* (Mantua 1927, 2nd ed. 1928).

Consult: Franchi, Bruno, *Enrico Ferri* (Turin 1908); *Scritti in onore di Enrico Ferri* (Turin 1929), articles in *Scuola positiva*, n.s., vol. ix (1929) pt. i; Bongier, W. A., *Criminalité et conditions économiques* (Amsterdam 1905), tr. by H. P. Horton (Boston 1916) p. 99-136; Collin, Fernand, *Enrico Ferri et l'avant-projet de code pénal italien de 1921* (Brussels 1925); Colajanni, Napoleone, *I partiti politici in Italia* (Rome 1912).

FERRINI, CONTARDO (1859-1902), Italian jurist. Ferrini began his legal studies at Pavia and finished them in Germany. He was the favorite pupil of Zachariae von Lingenthal, whose work he continued. Ferrini taught Roman law at Pavia, Messina and Modena, exemplifying always the historical method. The many briefer studies in various languages which Ferrini wrote during his short life have been collected by V. Arangio-Ruiz and E. Albertario (*Opere*, 5 vols., Milan 1929-30). These and his many longer works show Ferrini to be the least specialized of masters; he paid considerable attention even to modern law. In Roman law he was at times a dogmatic jurist, as in *Diritto romano* (Milan 1885, 2nd ed. 1898), *Teoria generale dei legati e dei fidei commessi* (Milan 1889) and *Manuale di pandette* (Milan 1900, 3rd ed. 1908), and at times a historian, as in *Storia delle fonti del diritto romano e della giurisprudenza romana* (Milan 1885). He also left a work on the Roman criminal law, *Diritto penale romano* (Milan 1899). Ferrini particularly distinguished himself in his original work on the law of the Byzantine period. He published *Il digesto* (Milan 1893), several articles on the sources of the Institutes of Justinian and some pre-Justinian Greek texts. Among his editions of texts are a new edition of the Paraphrase of the Institutes of Justinian, *Institutionum graeca Paraphrasis Theophilo antecessori vulgo tributa* (2 vols., Berlin 1884-97), published under the direction of Lingenthal; an edition of the *Nomos georgikos* (in *Opere*, vol. i, p. 375-95); a supplement to Heimbach's edition of the *Basilica* (Leipsic 1897); and the *Tipucitus* (bks. i-xii, Rome 1914); the last two were in collaboration with Mercati. Ferrini also translated Aristotle's celebrated work, *La costituzione degli Ateniesi di Aristotele* (Milan 1891, republished in *Opere*, vol. v, p.

253-394), and two Syriac manuscripts—he had learned Syriac expressly for this purpose—in the *Leges saeculares* (the MS. of Paris, in *Opere*, vol. i, p. 397-441; the MS. of London in *Fontes iuris romani anteiustiniani*, Florence 1909, pars altera, p. 637-75). Not satisfied with his eminence as a scholar, Ferrini was also an apostle of Christian charity, the "Ozanam of Italy," as he was called; and he has had the unique distinction among his peers of having his virtues proclaimed "heroic" by the Vatican on February 8, 1931, a preliminary honor to sainthood.

A bibliography of Ferrini's works is to be found in the *Opere* (vol. i, p. xi-xii).

FERRY, JULES FRANÇOIS CAMILLE (1832-93), French statesman. Ferry was perhaps the most hated statesman of the Third Republic, but in recent years he has received increasing recognition as the founder of the French school system and the builder of the modern French empire. As minister of public instruction from 1879 to 1882 Ferry was able to carry through the great educational reforms which are still the basis of the French school system. Building upon the ideas of Condorcet and the experiments of the French Revolution and guided by positivist principles he aimed to establish the "moral unity" of France and to strengthen the foundation of the Republic by the introduction of free, compulsory, lay instruction in the primary grades. At the same time Ferry reorganized the Conseil Supérieur de l'Instruction Publique by eliminating the clerical element. The monopoly of granting university degrees and teachers' certificates was reserved to the state. Members of unauthorized religious orders were forbidden to teach and all such orders were dissolved. Provision was made for state secondary education for girls and for the establishment of normal schools. The primary school curriculum was broadened by the introduction of new subjects like civics, natural history, singing, drawing and manual training. Large appropriations made possible the rebuilding of the Sorbonne and provincial universities and the establishment of laboratories, libraries and research facilities. This anticlerical legislation was bitterly opposed by

the conservative parties and brought upon Ferry their lasting hostility. During his second ministry, from February, 1883, to March, 1885, Ferry took over the portfolio of foreign affairs and continued the work of colonial expansion which he had initiated with the occupation of Tunis in May, 1881. He was convinced that sources of raw materials and markets would become increasingly necessary because of the economic transformation of the world and went so far as to cooperate with Bismarck to circumvent the opposition of the English. It was due largely to his efforts that the French position was established in the Congo and on the Niger, in Madagascar and in Indo-China. But his policy was attacked with great bitterness by both the radicals and the conservatives. In March, 1885, on receipt of exaggerated news of French reverses in China he was overthrown by Clemenceau and his followers.

FERTILITY RITES. Concern for the fertility of the human race and for the fruitfulness of the sources of food has supplied the motives for many traditional rituals and has given rise to ideas which have become embodied in religious systems. No sphere of human interest is less amenable to rational apprehension and control than generation, and accordingly the desire to control it tends in a larger measure than in other activities to rely on magico-religious means.

The economic interests of primitive humanity center round the multiplication of its food supply. The desire for progeny is beyond doubt largely influenced by cultural factors but is nevertheless prominent, more especially in the lower cultures. Upon the increase of the tribe depends its strength as a social unit, its power to compete against other groups. Numerical increase is therefore accounted equivalent to pros-

perity, diminution to decay. The stress laid by nationalistic and religious authorities upon increase and multiplication rests primarily upon the competitive advantage resulting from numerical strength. Social sentiment renders it therefore incumbent upon every member of the group to contribute toward its increase: fertility is a merit, sterility one of the deepest of reproaches. The latter is generally a ground of divorce and in lower cultures a motive of suicide. Where patriarchal individualism prevails, the transmission of frequent property and of social status to an heir is all important, and the desire to perpetuate the family is added to that of perpetuating the tribe. Magico-religious ideas confirm these social motives and values.

The food of hunting tribes is thought to be magically multiplied by ritual procedures, such as the *intichiuma* of the Australian aborigines and the buffalo dances of the Sioux. The assimilation of the participants in such rites to the animals over which they desire to exercise control suggests a connection with the conceptions of totemism. The procedures of sympathetic magic by which the multiplication of food animals is thought to be promoted commonly include the imitation of the sexual act and sometimes the practise of ritual promiscuity.

The fertility of the soil is likewise thought to call for the employment of magical means no less than for labor and skill to promote it. Thus, for instance, specimen seeds may be intensively cultivated in baskets or pots (Siouan basket gardens, "gardens of Adonis," "gardens of Osiris," Greek *κέρνα*). The lighting and tending of magical fires and the waving of torches over the fields are widespread features of agricultural magic. Magical herbs or the remains of animals—pigs, dogs, goats, serpents—are scattered or buried about the fields. Not infrequently human sacrifice was resorted to for this purpose, as in ancient Mexico, among the Pawnees, throughout west Africa, among the Bechuana and the Khonds of Bengal. In New Caledonia a young girl was buried up to the neck in the ground to promote the growth of sweet potatoes. Processions in which the images of the gods are carried form part of the rites of agrarian fertility in most advanced cultures. The various rites intended to produce rain constitute an essential part of agricultural magic.

Primitive cultivation, which is in the hands of the women, is held to be dependent for its success upon their magical skill and more particularly upon their fecundity. A prolific woman or

one who is actually pregnant is thought to be particularly suitable as a cultivator. Barrenness constitutes a disqualification. The fruitfulness of the earth is everywhere assimilated in the closest manner to human fertility. The fruit bearing soil is assimilated to the womb, the fecundating rain to seminal fluid, and the conjunction upon which fertility depends is represented by the sacred marriage of the supernatural powers, often enacted ritually by priest and priestess, in hierodulic prostitution or general promiscuity. The act of sexual intercourse is regarded as imparting fruitfulness to the soil and is sometimes indulged in for that purpose in the fields at the time of sowing, a custom illustrated in Greek myth and still observed by the peasantry in some districts of central Europe.

Sexual license is a prominent feature of the agricultural festivals of seed and harvest times. Thus among the Pipeles and the Musquaki Indians ritual coitus was timed so as to coincide with the planting of the seed. Among the Bantu, men and women who in ordinary circumstances are modest in behavior and speech are said to abandon themselves to licentiousness during these festivals. In India the harvest festival is the signal for general license, and such license is looked upon as a matter of necessity. The agrarian populations of southern Algeria resent any interference with the licentiousness of their women on the ground that such restrictions would be prejudicial to the success of their agricultural operations. The ritual promiscuity of primitive agrarian festivals is represented in more advanced cultures by the license of the festivals of Bubastis in Egypt and the ritual obscenity of the Greek Thesmophoria, the Roman Saturnalia, the Dionysian festivals, which have passed into the usages of southern and western Europe as the carnival festivities, May Day and midsummer feasts.

Human fecundity is in primitive and archaic thought also held to derive from the powers which govern the fertility of the sources of food. Apart from the possible ignorance of some of the most primitive peoples in regard to physiological processes, reproduction is commonly regarded as the effect of supernatural agencies. As the Christian avowedly believes that children are sent by God, so in lower cultures the part of the male in the reproductive process is held to be at most that of a vehicle of supernatural powers and fecundation is commonly believed to be possible by the direct action of those powers or through the medium of vehicles other than

the male. The same rituals which are employed to secure abundant harvests are accounted efficient in procuring offspring, and agricultural rites and festivals are regarded as equally effective in fulfilling both functions. Rain showers (as among Australian aborigines and the Hottentots), springs, rivers and holy wells are thought to promote or to be indispensable to the fertility of women. Conception is thought to be brought about or favored by the partaking of food, especially cereal and seed bearing fruit, whether especially consecrated or not, or the flesh of animals. Sacred spots where the spirits of the unborn are thought to dwell are believed in central Australia and among the Alfurs to cause the women who visit them to conceive, and cross-roads where children are buried were among the Iroquois thought to have the same effect. Graves and shrines of saints exercise a similar influence. Girdles, leaves, especially those of the fig tree, amulets worn in the neighborhood of the genitals, serve originally the purpose of fertility charms, both positively by imparting fertility and protectively by warding off injurious influences.

A large proportion of the rites commonly described as marriage ceremonies have reference to securing the fertility of the union rather than to its solemnization and consecration. Such are the rites in which food or drink is ceremoniously partaken of. The food may consist of game or fish procured by the bridegroom and presented to the bride, as among aboriginal Australians and the Eskimos. Coconuts, apples or eggs are sometimes employed with the same object. The bride is commonly pelted with flowers, cereals, dates, nuts, figs, sweetmeats. The newly married pair may stand on the hide of a bull or a ram or sit on mounds of earth, which sometimes are specially brought for the purpose from sacred spots, as in India. The invocations to the gods to bless the union frequently have reference to the promotion of its fertility as well as to making it binding.

Marriage is often preceded in the usages of primitive and ancient cultures by observances intended to bring about the union of the woman with the powers which are held to be the sources of fertility. This is sometimes effected directly by copulation with the image of the god. Thus in India girls were deflowered before marriage by means of the lingam, or phallus of stone, metal or ivory, representing the god Shiva. Roman brides had similarly to seat themselves on the lap of the phallic statue of the god Mutunus Tutunus. In China copper images of the gods

were rubbed against the abdomen of women as a cure for sterility. Survivals of the same practises were not uncommon in Europe during the Middle Ages with reference to statues of ithyphallic saints.

The so-called phallic character of many archaic deities and religious symbols follows from the function of divine powers as sources of generation, a function which corresponds in many respects to the more advanced theological conception of them as creators. Although magico-religious obscenity is prevalent in lower cultures, phallic symbolism is a characteristic of rather more advanced cultural phases, such as those of India and Japan and the more developed African cultures. The indiscriminate interpretation of religious symbolism as phallic has often been applied uncritically.

The god is sometimes represented by a priest or other sacred personage who has intercourse with the bride before she passes to her husband, a custom which is very widespread and constitutes the so-called *jus primae noctis*. Medicine men and persons with a reputation for sanctity are eagerly sought out by women in the hope of offspring. The means of divine union may also be sought in prenuptial promiscuity, for it is considered that in such general freedom the gods are afforded the same opportunity as other males. Such prenuptial license may be limited to strangers, as in Tibet and some parts of southern India, Burma and the Philippines or, as in the Babylonian observance of the temple of Mylitta, to a single stranger to whom it is obligatory for every woman to yield herself once in her life. The unknown stranger is in popular tradition a common disguise of the god. The prenuptial prostitution of the bride is, in the usage known as the Nasamonian rite from the description by Herodotus of the custom among the Nasamonians of Lybia, confined to the male guests attending the wedding, who each possess her in turn before the bridegroom is allowed access to her. Vestiges of those usages appear to survive in the rights of the wedding guests to kiss the bride, to dance with her and sometimes to undress her. Such rites are sometimes represented by the custom of postponing the consummation of the marriage for three or more nights, during which the bride is supposed to be dedicated to the god, who is sometimes, as in India and ancient Mexico, represented by sacred emblems placed on the bridal couch by the priest. The usage was adopted by the Catholic church under the name of Tobias nights.

The sacred and solemn character which marriage has acquired as a sacrament appears to derive in a considerable measure from the fiction that it is incumbent upon the woman before being joined to her earthly husband to enter into a holy union with the divine powers which are the true source of fertility. The human husband is thus held to act as the representative of the god, and it is enjoined in the code of Manu and in the Pauline doctrine that he should be regarded by the woman in that light.

The primitive rites of fertility magic have usually, as in the last mentioned instance, become adapted by cultural transformation to the social and moral demands of advanced culture. Thus, obligatory prenuptial prostitution was commuted in the rites of Adonis at Byblos to the symbolic shearing off of the woman's hair, a common marriage rite which is still observed by Catholic nuns on their dedication to the Divine Bridegroom. Ritual obscenity, which, like actual sexual intercourse, is held to exercise a stimulating influence upon the powers of fertility, has commonly been attenuated, as in the Fescennine jests of Roman harvest festivals, in the similar ritual ribaldry of Hindu marriage ceremonies and in the rites of Bona Dea, in which the matrons whispered the ritual ribaldry in each other's ears, a custom which survives today among the peasantry of the Rhine district on the occasion of the feast of the Three Maries. The supernatural means employed to promote fertility have commonly become subject to new interpretations which have veiled their original intention.

FERTILIZER INDUSTRY. Although the fertilizer industry, involving the manufacture and sale of the so-called artificial fertilizers, is a product of modern chemistry, the application of animal manures to cultivated soils is as old as knowledge of systematic agriculture. Chinese agriculture is still based on an extensive use of such fertilizers. References in Greek mythology indicate the existence of similar practises in pre-Homeric times. In Rome the use of animal manures, ashes, clays and lime was common, particularly in the cultivation of vineyards and olive groves. A somewhat similar but less extensive knowledge and practise of fertilizing existed among the more civilized of the Britons and the German tribes at the opening of the Christian era—a knowledge and practise which seem to have been extended greatly as a result of Roman influence. Although throughout the Middle Ages the use of marls, lime, stable manures and wood ashes as a means of renewing soil fertility formed a part of the empirical knowledge of agriculture, manuring was not extensively practised. It is probable that the decay of English agriculture in the fifteenth century resulted in part from inadequate fertilizing.

Soil fertility and plant growth assumed a new importance with the agricultural revolution of the eighteenth century, the introduction of large scale farming and the utilization of relatively large amounts of capital. Scientific fertilizing, however, awaited the development of chemical knowledge. Its basis was laid primarily by the chemical research of Justus Liebig and the research and agricultural field experiments of Sir John Lawes and Sir Henry Gilbert.

In 1840 Liebig made his famous report to the British Association for the Advancement of Science upon the state of organic chemistry (subsequently published as *Organic Chemistry in Its Applications to Agriculture and Physiology*, London 1840, 4th ed. 1847). Therein he developed and gave quantitative expression to the theory that the maintenance of soil fertility depended upon the return in the form of manure of the mineral constituents and the nitrogen which had been taken away. He recognized as the basic plant foods nitrogen, potassium and phosphorus. He further developed the principle, later formulated as the Law of the Minimum, that "by the deficiency or absence of *one* necessary constituent, all the others being present, the soil is rendered barren for all those crops to the life of which *that one* constituent is indispensable." Before he had finished his experiments the fun-

damental facts of plant nutrition had been established.

Some years before Liebig's report John Bennet Lawes had begun research and experimentation on soil conditions at his farm at Rothamsted, England. He found that apatite and other mineral phosphates when treated with sulphuric acid formed a superphosphate of lime which proved to be a very effective manure. In 1843 he established the first factory for the manufacture of superphosphates. In the same year he was joined by Joseph Henry Gilbert in his experimental work at Rothamsted. This fruitful association continued without interruption until the death of Lawes in 1900. More recent contributions to the knowledge of plant nutrition and growth have been made for the most part in the study of soil bacteriology and soil physiology.

The researches of Liebig, Lawes and Gilbert and those who have followed in their footsteps have helped to revolutionize agriculture, particularly in regions where long exploitation had exhausted the soils of their plant foods. They have necessitated modifications in the implications of the Malthusian principle of population and the Ricardian doctrine of rent. The importance of the work of these scientists is indicated roughly by the fact that the estimated world's consumption of commercial fertilizer in 1928 measured in net tons of plant food—nitrogen, phosphoric acid and potash—approximated 7,700,000 tons.

Around these three plant foods the modern fertilizer industry has developed. In the location of the basic industries for supplying the raw materials for the fertilizer industry, geologic and geographic circumstances played the major role at the outset. For many years the Peruvian and Chilean coasts of South America supplied large quantities of guano, derived from the excrement of sea birds, rich in nitrogen and phosphorus and containing small amounts of potassium. Before the end of the nineteenth century guano as a source of commercial fertilizer had been largely replaced by the Chilean deposits of sodium nitrate, the American and French deposits of mineral phosphates and the German deposits of potash salts.

Shipments of nitrates from Chile had begun as early as 1830, although they remained small until the middle of the nineteenth century. By 1875 Chile had become the world's most important source of inorganic nitrates through exploitation of her unique deposits of caliche—

a mixture primarily of sodium nitrate and sodium chloride—which extend irregularly just below the surface of a strip five hundred miles long and from five to forty miles wide. The industry consists of the mining and refining of the crude salts and the sale of the refined product, sodium nitrate, to distributors in the major fertilizer consuming and industrial areas of the world. In 1913 the Chilean output represented approximately 55 percent of the world's nitrogen consumption. Germany was the leading consumer of the Chilean product, taking more than 32 percent of the total, while the United States consumed about 23 percent.

The World War by demonstrating the danger of dependence upon the Chilean source of supply of nitrates for fertilizer and explosives hastened the development and expansion of the by-product and synthetic nitrogen industry. Completely cut off from the Chilean industry during hostilities, Germany took the lead in this development. The German industry assisted by the government advanced with such rapidity that it not only attained the goal of economic self-sufficiency but became an important exporter of nitrogen products. France, England and Italy, although not so hard pressed as Germany, also took steps during the war to fill their nitrogen needs independently of Chilean supply. In the United States the government constructed a cyanamide plant at Muscle Shoals, Alabama, which was intended to furnish nitrates but was not completed until 1919 nor operated save for a trial run in that year. As a result of the war's influence in bringing new capacity into existence and the subsequent development by private enterprise of the by-product and synthetic nitrogen industry Chile in 1929 was supplying less than one fourth of the world's consumption of nitrogen. The restrictive taxation policy pursued by the Chilean government and the quasi-monopoly conditions under which the product has been marketed have contributed to this development.

As a pre-war source of nitrogen, ammonium sulphate, a by-product of the distillation of coal, ranked next in importance to the Chilean deposits of sodium nitrate; but in 1929 only one fifth of the world's nitrogen supply came from this source. In the production of by-product nitrogen the United States has held first place for some years; in 1929 American output represented approximately 40 percent of the world total. Far more important today, however, than by-product and Chilean nitrogen is atmospheric

nitrogen secured by fixation from the atmosphere either by the Haber synthetic ammonia process developed by the Germans during the war, by the cyanamide or by the arc process. German industry has taken the lead in this whole field. Of a total world capacity for fixation of atmospheric nitrogen amounting to 2,203,900 net tons in 1929 Germany ranked first with 938,500 tons and the United States was second with a tonnage of 195,600.

TABLE I
WORLD PRODUCTION OF INORGANIC NITROGEN,
1913 AND 1928-29.
(Net Tons)

SOURCE OR PRODUCTION PROCESS	1913	YEAR ENDING MAY 31, 1929
Chilean nitrate	429,000	539,000
By-product ammonia	377,300	469,700
Air fixation:		
Arc process	19,800	33,000
Cyanamide process	66,000	264,000
Synthetic process	7,700	1,018,600
Total	899,800	2,324,300

Source: United States, Department of Agriculture, "Survey of the Fertilizer Industry" by P. E. Howard, *Circular*, no. 129 (1931).

Of the total world production of fixed nitrogen in 1929 about 87 percent was used in agriculture. The bulk of the Chilean natural nitrate output is similarly consumed; before the war it was estimated that three fourths of the output was used in fertilizers.

Just as Chile prior to the development of a by-product and synthetic nitrogen industry enjoyed virtually a world monopoly in the production of nitrates for the fertilizer industry, so Germany at the outbreak of the World War enjoyed a world monopoly in the production of potassium fertilizer salts. The German deposits of potassium salts were discovered accidentally in 1859 in a mine sunk by the Prussian fisc in the neighborhood of Stassfurt in a search for additional supplies of rock salt. From the five major producing areas subsequently delimited in pre-war German territory came virtually the entire world output of potash for fertilizers. The industry involved the mining, refining and marketing of potash salts from these sources. The mining process is similar in its fundamentals to that of coal. To eliminate unnecessary freight charges most of the crude salts are put through a refining process at plants located near the mines. The crude salts consist for the most part of carnallite, hartsalz and sylvite. The task of refining is to separate the potash salts from the other ingredients by precipitation. The potash

salts are then dried and stored in bulk or sacked for shipment. The process is highly mechanical and is conducted on a large scale basis.

In 1913 approximately 90 percent of the German potash production was utilized as fertilizer. About 46 percent was exported. The World War was accompanied by an almost complete cessation of German exports and the customary foreign users of potash were hard pressed to find substitute sources of potash not only for fertilizer but for explosives, in the manufacture of which it is an essential ingredient. A variety of American sources were tapped. Giant seaweed on the Pacific coast, lake brines in California and Nebraska, and cement and blast furnace dust were made to yield potash in commercial quantities. These sources were adequate to meet essential war needs but insufficient for customary agricultural consumption.

Since the war the German world monopoly has been broken by the cession to France of Alsace, which has abundant deposits of sylvite. Of the American war born industries most have succumbed to the vigorous post-war onslaught of the more mature foreign industry. An exception is the Searles Lake plant in California, which supplied approximately 15 percent of the entire American consumption of potash in 1928. Salts from the promising deposits in southeastern New Mexico were first placed on the market in 1931. Although in the Atlantic coast and southern states, where most of the potash is now consumed, the foreign product would seem to have an advantage in freight rates, the American product is likely to supply an increasingly large percentage of the domestic demand. Since the war, deposits of water soluble potash salts have been mined and refined on a small scale in Poland and Spain. Output from these areas has shown a continuous increase, and it is not unlikely that these two countries may assume a more important place in future production. Among other countries Soviet Russia has announced the discovery of potash deposits, but it is now using sunflower plants to produce fertilizer rich in potash. World production of potash, exclusive of Spanish output, for which specific figures are not available, increased 67 percent from 1913 to 1928 as indicated in Table II.

The major commercial source of the third essential plant food, phosphorus, is phosphate rock. Phosphate rock, containing high percentages of tribasic phosphate of lime, is available in practically unlimited quantities and deposits

TABLE II
WORLD PRODUCTION OF POTASH BY COUNTRIES,
1913 AND 1928
(Metric Tons)

	1913	1928
Germany	1,328,000	1,691,000
France		447,000
United States		54,000
Poland		53,000
Others	20,000	10,000
Total	1,348,000	2,255,000

are widely distributed throughout the world. American production of phosphate rock dates from 1868. The output of the mines of Florida and Tennessee has made the United States the largest single producing country, but since the World War the combined output of France and of mines in Tunis and Algeria has come to exceed that of the United States. French and American production in 1928 amounted to about 85 percent of the world total. Most of the remainder came from the island of Nauru ceded by Germany to England under the Treaty of Versailles. Deposits of phosphate rock occur for the most part near the surface and are mined by the open pit method. Small amounts of phosphate rock are used directly in agriculture after fine grinding; but because of its slight solubility in raw form the bulk of the output is subjected to treatment with sulphuric acid to form the so-called superphosphates, or acid phosphates. These are prepared for the most part in the consuming countries. In 1928 the United States, France, Italy, Japan and Germany were the leading producers. The United States' output represented 29 percent of the total.

Secondary to phosphate rock as a source of phosphorus for fertilizing purposes is basic slag, a by-product in the manufacture of steel from ores containing phosphorus. This source furnished more than one fourth of the world's fertilizer phosphates in 1928, the leading producing countries being France, Germany, Belgium and Luxemburg.

It is estimated that in 1928 a total of 43,000,000 tons of fertilizer salts containing approximately 7,700,000 tons of the three essential plant foods was consumed throughout the entire world. Germany, the United States and France were the largest consumers, using more than one half the world total. On a per acreage basis the Netherlands and Germany were the largest consumers. The lead taken by these two countries is in part a reflection of the natural deficiency of

TABLE III
WORLD PRODUCTION OF SUPERPHOSPHATES OF LIME AND BASIC SLAG, 1913 AND 1928
(Metric Tons)

COUNTRY	SUPERPHOSPHATES OF LIME		BASIC SLAG	
	1913	1928	1913	1928
United States	3,248,000	4,057,241	—	18,144
France	1,920,000	2,265,000	730,000	1,475,000

the central European soils in plant food, particularly potash; in part a reflection of the intensive character of the farming which has developed with population increase; and in part a reflection of the intensive propaganda carried on by the German potash syndicate in these areas. American consumption is confined largely to the Atlantic coast and southern states in the production of truck crops, tobacco and cotton.

For the most part the European consumer uses the major commercial fertilizers in an un-mixed form, applying each separately to the soil in such quantities as his judgment or knowledge dictates. The American consumer, on the other hand, generally applies his plant foods to the soil in the form of a mixed fertilizer. The organization of the fertilizer industry has conformed in a rough way to these contrasting practises. In the United States it has been organized primarily around the manufacture of superphosphates by companies who own and operate plants for the production of mixed fertilizers, located for the most part in the major fertilizer consuming areas. The manufacturers have been the purchasers of nitrates and potash and the distributors of the finished mixed fertilizer. In numerous instances they are also producers of the raw phosphate. The bulk of the American fertilizer output is in the hands of a few large companies, such as the Virginia Carolina Chemical Corporation, the American Agricultural Chemical Company, the International Agricultural Corporation and the Davison Chemical Company, engaged in these several integrated processes. In addition there are several hundred manufacturers of mixed fertilizers, who purchase finished fertilizer salts and mix them for

sale under trade names. Some of the post-war manufacturers of nitrogen, particularly the Allied Chemical and Dye Company, the American Cyanamid Company and Du Pont de Nemours Company, likewise produce mixed fertilizers. These mixed fertilizer manufacturers purchase most of their potash through the exclusive selling agency of the German and French potash syndicates. In the past they have secured their nitrogen salts primarily through an exclusive selling agency serving the by-product nitrogen industry or direct from importers. The marketing of mixed fertilizers is a highly competitive business, one of the chief characteristics of which has been the confusing multiplicity of brands and trade names. Sales are made direct to the farmers, to agricultural associations and to local retailers, who are frequently seed or implement dealers. The manufacture of branded mixed fertilizers has made the American consumer, uninformed and ignorant as he frequently is, peculiarly subject to deception and abuse. For his protection by March 1, 1930, all but seven states had enacted laws regulating the manufacture and sale of fertilizers. In general these laws have provided for the periodic registration of brands, accurate and not misleading labeling, minimum plant food contents and inspection and analysis of fertilizers by state officials. American manufactured mixed fertilizers have been customarily of low plant food content, containing until recently as little as 160 pounds of plant food to a ton of fertilizer, the remainder consisting of the associated salts of the original raw materials, chlorine, sodium, calcium and the like, and inert material such as sand added by the manufacturer to bring the product to the

desired consistency. As a result of education and legislation the plant food content has been raised until at the present time it approximates 16 per cent of the total. With the manufacture of more concentrated constituent salts and an increase in the knowledge of their proper use the trend toward a more concentrated mixed product is likely to persist for some time.

In addition to the inorganic salts utilized by the American fertilizer industry a considerable volume of organic nitrates is furnished by the packing industry from tannage, dried blood and fish scrap and of phosphates from bones. These are marketed under a variety of trade names by organizations which are affiliated with the large packers.

The American fertilizer industry is closely associated with the chemical industry. It is the largest consumer of sulphuric acid, accounting for approximately one third the total consumption; it furnishes an outlet for sulphate of ammonia secured in the distillation of coal and petroleum; it is dependent upon the cement industry, the copper industry and other chemical industries for raw materials and finished products.

In contrast to the American industry, shaped around the manufacture of mixed fertilizers, the European industry until very recently has consisted of three separate branches specializing respectively in the manufacture of potash, nitrogen and phosphate fertilizer salts. The latter two are subdivisions of the chemical industry, with which the manufacture of potash is also closely associated. In Germany the potash industry is under the control of the Deutsches Kali-Syndikat. Before the World War the actual production, mining and refining, of potash salts was distributed among a large number of producers who were members of the syndicate. Since the war production has been much more concentrated, approximately 80 per cent of the total being produced by three large companies. Of some half dozen additional producers the Prussian fisc is the most important. The salts are placed on the market as muriate of potash, sulphate of potash and the so-called manure salts and sold by K_2O content. They are sold exclusively through the syndicate direct to agricultural associations, fertilizer dealers or fertilizer manufacturers.

In 1925 the German potash syndicate and the French syndicate organized after the war entered into an agreement for the division of the world's markets, for the conduct of a joint prop-

aganda program and a common price policy, under the terms of which competition in the sale of their products is effectively eliminated. The agreements as extended and modified have resulted in the stabilization of prices both in the foreign and domestic markets at levels somewhat higher than are likely to have prevailed in the absence of such agreements.

The German manufacture of synthetic nitrogen is concentrated in the hands of a few large companies, the most important of which is the I. G. Farbenindustrie, the German dye trust. These several companies are associated for the sale of their products into the Stickstoff-Syndikat. In 1929 an agreement was entered into by the German nitrogen syndicate, Imperial Chemical Industries, Ltd. (controlling the bulk of the English output of synthetic nitrogen) and Chilean nitrate producers for the purpose of joint propaganda and uniformity of price policy in the sale of nitrogen salts in the world's major markets.

In recent years the I. G. Farbenindustrie in addition to its manufacture of nitrates has engaged in the production of a mixed fertilizer, a precedent that has been followed by several producers of potash. Inasmuch as savings in freight are effected through the production of a more concentrated product, it is possible that this practise may undergo considerable expansion in the future.

Thus far the manufacture and sale of superphosphates have experienced no such concentration of control as that to which the nitrogen and potash industries have been subjected. Nevertheless, a tendency in this direction has been manifest. In the United States a few companies control the bulk of the output. In France from 60 to 70 per cent of the output is in the hands of two large companies. In Germany, although the manufacture has been relatively decentralized, producers have united for marketing purposes in a sales cartel. Moreover, the leading producers of the world are associated for purposes of mutual benefit in the International Superphosphate Manufacturers' Association with headquarters in London. Twenty-four countries with about 70 per cent of the total world output are said to be represented in this organization, one of the primary functions of which seems to be joint activity in scientific agricultural research and joint propaganda in the sale of phosphate fertilizers.

It is a long step from the early activities of Liebig and Lawes in the small scale manufacture

Encyclopaedia of the Social Sciences

of artificial fertilizers to the modern fertilizer industry, world wide in its character and of fundamental importance to permanent agriculture. Despite the increased dependence of agriculture upon this basic industry, however, the earlier fears regarding an inadequacy of fertilizer materials have given way to a realization that a surplus of producing capacity and an excess of output of its basic materials are apt to become the major problem confronting the fertilizer industry. Developments in the field of synthetic nitrogen manufacture during the war and in the decade following have resulted in a plant capacity far in excess of current demands. Meanwhile it has become evident that the Chilean natural nitrate deposits have as yet been scarcely touched. Phosphate deposits richer in content and larger in volume than were presumed to have existed have been discovered, and new potash deposits threaten to break the post-war Franco-German potash monopoly. The most pressing future needs of the industry may prove to be a mechanism for control of capacity and an appropriate distribution of world markets.

FESTIVALS derive for the most part from collective ritual. The tendency of primitive behavior to rely upon magic involves the participation of the social group—clan, tribe or family—in activities which are held to affect the interests of the whole group. Hence the greater proportion of primitive ritual is collective, and most activities involve collective rituals. Meals partaken of in common assume the character of religious ceremonies. The admission of new members to the tribe, the disposal of the dead, ceremonies for the propitiation or placation of supernatural powers, for relief from sickness and epidemics, for the preparation of warriors, hunters and fishermen before an expedition, are occasions for collective rituals, or festivals, in which the entire community joins. Agricultural operations are associated with a series of ritual festivals.

Primitive collective rituals are often governed in their incidence by the phases of the moon. The *intichiuma* of central Australia and the majority of ritual dances take place at the full moon. The new moon and the interlunary days, on the other hand, usually regarded as unpropitious periods, are the occasion for the observance of rites of mourning and aversion. Agricultural civilizations observe seasonal feasts, the chief of which usually take place at the time of the summer and winter solstices. The dates of the observances are subject to considerable variation. The Celtic festival of Samhain, for instance, which was celebrated in Ireland on the thirtieth of October, was observed in Gaul at the beginning of January. In several instances the rites which were originally related to the monthly cycle have become transferred to the yearly cycle, the dates being, however, still determined by the older lunar calendar and not by the later solar reckoning. Sometimes the incidence of periodic festivals is determined by the rotation of crops, necessary in early stages of agriculture, as in the instance of the Greek *trieterica*, or three-yearly festival.

Primitive collective rituals, primarily designed as magical operations to influence supernatural agencies, have sometimes retained that character in the later phases of cultures, as in the majority of purely religious festivals and in those connected with agriculture. Rites of abstinence,

penance and mourning, such as the celebration of passions, lamentations, *agneia*, fasts and rogation days, have for obvious reasons tended to preserve their religious character. Commonly, however, the magical function of collective ritual has undergone decay, and other purposes have come to acquire greater interest and importance. Funeral feasts, primarily characterized by abnegation and mortification, and intended to exercise a placatory action and to avert envy, often assume even in primitive cultures the avowed character of carousals and of occasions for social conviviality and indulgence. The transition from magico-religious functions to simple festivity and revelry is generally favored by the nature of collective rites, which commonly include orgies of eating and drinking and the removal of customary restraints, particularly sexual tabus and class distinctions. The Jews were fond of regarding their religious festivals as manifestations of joy, and indeed the term *chag* (Arabic *hadj*) by which their ceremonial festivals were denoted comes from the root which means to dance in a circle, and the *pesach*, or Passover, is the "feast of leaping." The license common in fertility rites, which was originally magic in intention, is also indulged in for its own sake. Rituals connected with agricultural and other cults have given rise to theatrical drama and comedy. Festivals originally intended to promote the activity of nature by sympathetic exertion on the part of the participants have tended to be valued for their own sakes as dances, athletic contests and sports. The vestments, disguises and ritual symbols, which at first possessed a functional magical significance, have given rise to pomp, decoration, ceremonial and display that are enjoyed on their own account. Dispositions generally disavowed and inhibited, such as the interest in bloodshed and cruelty, are afforded in primitive ritual an outlet which has long survived in popular festivals, as, for instance, in the Roman gladiatorial games, in the baiting of animals, in bullfights, in the torturing and burning of heretics, which formed a part of popular, religious and dynastic festivals in Spain, and in public executions, which were until late times occasions for festive popular holidays in England and on the continent. The potent appeal of license, festivity, merrymaking and the "holiday spirit" has naturally contributed in a large measure to the survival of what were originally ritualistic observances. Clement of Alexandria denounced the attachment shown by Greco-Roman populations to pagan cults as

due to the opportunity which those cults afforded of indulging their passions. It is largely owing to the impossibility of inducing the multitude to forego those opportunities that the church felt compelled to adopt the policy formulated by Pope Gregory VII of transferring pagan festivals to Christian auspices and of bestowing an outward sanction on the gratification of deep seated yearnings, which were afforded an outlet in the occasional release from the austerity of social and moral restrictions.

The social utility of such relaxations of social codes in safeguarding the established order is acknowledged in formulae like *panem et circenses*. The popularity of Roman officeholders was largely dependent upon their liberality in furnishing popular festivals. The utilitarian purpose of festivals is even emphasized in religious doctrine, as in the chartered license of the carnival as a preparation for the mortifications and privations of Lent or the *'id es-saghir* following the Moslem fast of Ramadan. The temporary obliteration of class distinctions, the innocuous fraternization of masters and slaves, characteristic of the Roman Saturnalia and Lupercalia and paralleled in the servants' ball and similar feudal institutions of England, the transitory illusion of affluence and luxury afforded by largess to the populace, the relaxation of rigid sexual codes, all operate as powerful elements in the appeal of chartered festivities and serve at the same time as safety valves against the dangerous effects of continuous restraint. The professedly benevolent concern of established authorities in the supplying of amusements and pleasures suited to the tastes of the multitude is recognized as a valuable means of allaying disaffection, of turning the edge of disloyalty and of distracting the popular mind from more dangerous, if more serious, interests. Organized sports, nearly all of which may be traced to primitive rituals having a magic purpose, are overtly preconized, in the English public school system, for instance, as the most suitable outlet for exuberant vitality that would naturally tend to flow in more perilous channels. And the gravity of periods of political and social unrest may be gauged by the amount of attention devoted by the authorities and the official press to sporting events and festive pageantry.

The extreme license and orgiastic character of festivals directly derived from primitive ritual were from an early date subjected to moderating regulations on the part of religious and political authorities. The drunkenness and disorder which

characterized the Jewish harvest festival of *chag hasucloth*, the Feast of Tabernacles, called forth the denunciations of the prophets. A similar ascetic disparagement of feasting is found in Buddhism. In Athens the phallic symbols in the Iesmophoria and Dionysian festivals had to be covered or disguised, the obscene hymns submitted to censorship, and Solonic laws, according to Plutarch, regulated the outgoings of the women and their festivals, forbidding all disorder and excess. The corresponding ritual feasts in southern Italy and Rome, the Bacchanalia, were during the second century B.C. the object of much fierce state opposition, amounting to persecution.

In both the Attic and the Italian festivals the image of the god was drawn in a chariot shaped like a ship—originally, as in Egyptian processions, the ship in which the deity navigated the waters of the celestial ocean—and the engine, similar to the floats in modern pageantry, was known as the *currus navalis*, an expression which has given rise to the term *carnival*. An identical usage obtained in Flanders, the deity being in this instance the goddess Bertha (the Nerthus of Tacitus) whose wheeled ship was followed in torchlight processions by disorderly crowds of scantily dressed women. The festival despite its extremely licentious character was, like other pagan observances, adopted by the Catholic church. The Teutonic feast of *Fastnacht* (*Fasnacht*, or Vigil of Folly) and the Celtic brandon feast were similar, although less pronounced in their license. The carnival feasts, in which the participants wore masks and were often dressed in white shrouds to represent ghosts (the pierrots and the punchinellos of later times), excited, notwithstanding their adoption by the church authorities, the repeated denunciations of the clergy.

The Roman feast of sowing, known as the Saturnalia, or *Libertas Decembri*, was of a like character. It began on the seventeenth of December and originally lasted three days but was gradually extended to the first days in January. In their Christian form the December or Christmas festivities constituted what was known as the Feast of Fools, the revels being under the mock presidency of a personage variously known as the Lord of Misrule, the Abbot of Unreason, the Boy Bishop, some of whose traits have been transferred to the adopted Teutonic Santa Claus. The guisers, or Christmas waits, of Scotland still wear miter shaped caps of brown paper. The adopted pagan festival was, like the carnival, the

constant object of ecclesiastical denunciations. The Lord of Misrule was suppressed in Scotland in 1555, and the Feast of Fools succumbed to the repeated condemnations of ecclesiastical councils. Protestantism, fundamentally hostile to all festive manifestations, was keen in scenting out the pagan character of church festivals and in waging war against their chartered license. May Day festivals, once among the most popular in England, were all but suppressed by Puritan zeal. In like manner the weekly feast of rejoicing, or Day of the Sun, taken over by the early church from current Roman Mithraic usage has, like the continental Sunday, been the object of the fierce denunciations of Puritanism; and the observance of the Sabbath or Saturday, which had been severely condemned by the early Christian church and tradition for its Judaizing tendency, was adopted and with strange inconsistency transferred to Sunday. Early Puritan opposition to Christmas and other church festivals led for a time to their neglect. The commercial interests involved in the observance of those festive seasons has, however, operated as a potent factor in preserving them from obsolescence. The celebration of Christmas and the New Year, of Easter and of minor feasts, such as St. Valentine's Day and April First in France, is encouraged on account of the benefits which accrue to trade. New festive occasions, such as Mother's Day, have been promoted from similar motives.

Secular authorities have never neglected the many social advantages to be derived from the encouragement of festivals, pageants and holidays. State festivals, although deriving their pattern from religious ritual, have commonly been purely secular and political in origin. In China the utmost importance was attached to the celebration of the birthdays of the emperor and of the empress, to the day of receiving the imperial message at the monastery and to the anniversaries of the deaths of all the emperors of the reigning dynasty. The feasts of the new moon and the full moon were likewise associated with concern for the welfare of the Son of Heaven. Democratic, republican and even communist states have taken over much of the tradition of civic policy from autocratic and theocratic states and have shown themselves no less eager to use the solemnity and pageantry of festivals as means for cultivating civic loyalty and patriotism. The pomp and circumstance that had been devoted to inspiring martial ardor and to stimulating loyalty to the throne have come to be used to

inculcate enthusiasm for peace, for liberty, equality and fraternity and for the social revolution against capitalism and militarism.

Collective festivals, the symbolism of pagantry and ceremonials are among the most powerful means influencing the psychology of crowds and will doubtless always serve their purpose as the most concrete expression of collective emotions and loyalties. The chief disadvantage attaching to such collective expressions lies in the inevitable tendency of formalism and ritual to take the place of genuine feeling and conviction and in the hypocrisy which frequently attends the customary, formal or compulsory participation of the individual in regulated expressions of sentiments which he may not always truly share. The wasteful expenditure lavished on frivolous occasions of festivity has, since the Middle Ages, been the object of protest and criticism.

FETISHISM is the magico-religious belief in and use of material objects held to possess supernatural virtue either in their own right

or because of the presence of a spirit. In a more popular sense the term stands for any sort of materialism in religion, any tendency to treat divine power or mind as having a body or as operating like a physical force. The word was first used by the Portuguese, who reached west Africa in 1481 and classed the cult objects of the natives under the loose and general head of *feiticos*, or charms.

At first the term and its derivatives referred only to west African practises. Purchas in his *Pilgrimage* (1613) described "strawen rings called *Fatissos* or Gods," and used *fetissan* for fetichlike and *fetiséro* for the fetish-man. Dapper (*Naukeurige beschrijvinge der afrikaensche*, Amsterdam 1668; French translation Amsterdam 1686, p. 307, 313) wrote of *fetisis* and the *fetiséro*, the former including "idols of wood and green herbs" and an "old earthenware pot." Bosman (*Naukeurige beschrijving van de guinese Gond-Tand-en slave-kust*, Utrecht 1704; English translation 2nd ed. London 1721, p. 348), while allowing a general belief in "one true God," supposed it to have been acquired through contact with Europeans and contrasted with it the fetish as represented by "the false god Bossum," as also by animals, plants and stones. Most ethnographers dealing with this part of Africa have been wont to refer in the same indiscriminate way to the fetishes, or jujus, without trying to indicate how far such terms of purely European origin and of decidedly dyslogistic import have any precise counterpart in the indigenous vocabulary or scheme of thought. Rattray, however, in *Religion and Art in Ashanti* (ch. ii, p. 322-24), while vigorously protesting against fetishism as a suitable description of Ashanti religion in general, is prepared to identify the fetish with the *suman*, defined as "an object which is the potential dwelling-place of a spirit or spirits of inferior status, generally belonging to the vegetable kingdom; this object is also closely associated with the control of the powers of evil or black magic, for personal ends, but not necessarily to assist the owner to work evil, since it is used as much for defensive as offensive purposes." The power of such objects is not derived from the gods (*abosom*—Bosman's Bossum) but from spirits of an inferior order such as the *sunsum* of plants and the *mmoatia*, or "fairies." The priest of the high god Ta Kora would have no *suman* in his temple, declaring that "*suman* spoils the gods." The *samanfo*, or ancestral ghosts, which Rattray regards as "the predominant influences

in the Ashanti religion," have nothing to do with *suman*. The latter, in short, are the instruments of a supernatural power conceived as relatively blind and unmoral in its workings, whereas gods and ancestors are definitely beneficent beings. The word ought then to be used only in reference to the *suman* even when strictly confined to west African phenomena. Its use as a technical term is hampered by the fact that it belongs to the slang of the coast and having a derogatory implication leads to an undervaluation of the higher elements undoubtedly present in the complex of native beliefs.

Fetishism was first promoted to the status of a general category of comparative religion when President C. de Brosses published his famous work, *Du culte des dieux fétiches* (Paris 1760). Until Tylor's animism displaced it fetishism stood as the established name for the most primitive type of cult, treated as a stage through which humanity as a whole had passed and regarded as a sort of lower idolatry, in which the idol is rather the embodiment than the symbol of the associated spiritual power. De Brosses thought *fétiche* to be connected with *chose fée*, *fatum*—an etymological error which may have helped to invest the phrase with additional vagueness. By the time that Comte tried to envisage it as the initial stage of human religion it had become equivalent to the veneration of the powers of nature as revealed in any of its forms and manifestations. It is in accordance with this sweeping conception that McLennan, the discoverer of totemism, described the latter as "fetishism with certain peculiarities." When Tylor in *Primitive Culture* (1871) proposed animism, "the belief in Spiritual Beings," as a minimum definition of religion he virtually sounded the death knell of fetishism as a classificatory term by directing attention to the principle that causes a given object to be accounted sacred. Tylor, who believed that in all cases an indwelling spirit of some kind is held to be implicated, retained the term fetishism as a "subordinate department" of animism, which consists in "the doctrine of spirits embodied in, or attached to, or conveying influence through, certain material objects" including the worship of "stocks and stones" and passing "by an imperceptible gradation into Idolatry" (vol. ii, p. 144). He denied, however, that all objects "to which ignorant men ascribe mysterious power" amount to "real fetishes" and excluded "symbolic charms working by imagined conveyance of their special

properties, as an iron ring to give firmness, or a kite's foot to give swift flight." He restricted the use of the term fetish to an object which "is treated as having personal consciousness and power, is talked with, worshipped, prayed to, sacrificed to, petted or ill-treated with reference to its past or future behaviour to its votaries." By this definition the word which originally meant charm now had that very meaning expressly disallowed.

Tylor's authority held undisputed sway until the end of the century, when his doctrine of animism was attacked or rather supplemented from two sides at once. It was urged that room must be found within the complex of primitive religion both for a dynamism involving notions of the type of mana—a contagious wonder working power of a more or less impersonal kind—and for an anthropomorphic theism involving high gods conceived as "magnified non-natural men," not wholly explicable in terms of animism.

Modern anthropology would do well to treat fetishism as an obsolete term for ethnological purposes. Moreover, the scientific ethnographer might be wise to dispense with the word fetish even in its historic sense, namely, as it applies to "a limited class of magico-religious objects in Africa." Meanwhile popular writers will doubtless continue to use fetishism and fetish, together with phrases such as "making fetish" (i.e. holding a ceremony) and "taking fetish" (i.e. swearing an oath), without regard to consistency of meaning and as if concerned with one dead level of base superstition.

CHINESE.....	O. FRANKE
JAPANESE.....	K. ASAKAWA

EUROPEAN. The adjective *feodalis* (relating to the fief) and the French substantive *féodalité*, used in the restricted sense of a quality peculiar to a fief, date the first from the Middle Ages, the second probably from the sixteenth century. But it was not before the eighteenth century that the custom arose of using for the designation of a whole system of social organization either compound expressions like feudal regime, government or system or, a little later, abstract substantives such as *féodalité* or feudalism. German historians in general have adopted *Lehnwesen* from *Lehn*, the German equivalent of fief. The extension of the use of a word derived from a particular institution, the fief, which can scarcely be considered the central and only significant institution of feudalism, to characterize the social regime prevailing widely during the Middle Ages, and more particularly from the tenth to the thirteenth centuries, in the greater part of western and central Europe is mainly attributable to the influence of Montesquieu. Although Montesquieu considered the establishment in Europe of "feudal laws" a phenomenon *sui generis*, "an event occurring once in the world and destined perhaps never to occur again," modern sociologists and comparative historians have detected in other civilizations the existence of institutions analogous to those of the Middle Ages. Consequently the term feudalism has come to be applied to a mode of social organization that may recur in divers forms in differing periods and environments. Mediaeval European feudalism nevertheless remains the model of all feudal systems as well as the best known.

The origins of the European feudal regime have too frequently been discussed under the form of an ethnic dilemma: are they Roman or Germanic? As a matter of fact the social type that is called feudalism was born in Europe of conditions peculiar to the society from which it sprang. Since feudal society did not stamp itself upon a clean slate, but evolved little by little through the slow adaptation and modification of older usages, it is not difficult to discover in it traces of earlier systems of organization. But these elements were borrowed from very diverse environments. The feudal vocabulary itself, which combines Roman elements—one of

them, the term vassal, taken by the Romans from the Celts—with Germanic elements by its very mediocrity represents the singularly mixed character of the society in which feudalism took its rise.

The most remarkable characteristic of the western world at the beginning of the Middle Ages was the fact that it had been constituted by the encounter and fusion of civilizations existing at very unequal stages of evolution. On the one hand, there was the Roman or Romano-Greek world, itself hardly a unit in its foundations. For under the apparent uniformity of the imperial façade many local usages persisted which imposed conditions of life at times quite dissimilar upon the various social groups. On the other hand, there was the still comparatively primitive civilization of the peoples of ancient Germany, who had invaded the Roman domains and carved kingdoms out of it.

The bankruptcy of the state represents the most potent fact during this period. Whatever care the kingdoms of the barbarians may have taken to turn to their profit the formidable administrative system of ancient Rome—already, moreover, far advanced in decay at the time of the great invasions—however remarkable an effort at rehabilitation the monarchy of the first Carolingians may have represented after a century of extreme disorder, the powerlessness of the central government to exercise an effective control over a territory much too extensive for the forces at its disposal betrayed itself more and more glaringly, and for a long period after the middle of the ninth century, in a manner truly irremediable. Undoubtedly the reinforcement accruing from the Germanic traditions was not in this regard entirely negligible; the conception of royalty as the appanage of a sacred family, which derived from the most primitive notions of ancient Germany, resulted in a dynastic perpetuity better established than any that the Roman Empire had ever known. The idea of the state—or, more accurately, the idea of royalty—never entirely vanished. Likewise the institutions codified by the Carolingians long continued, more or less deformed, to exercise an influence. Men, however, lost the habit of expecting protection from a too distant sov-

ereign. They sought it elsewhere and supplanted their obedience to the more remote ruler by other ties of dependence. The state tax ceased to be collected and the administration of justice was parceled out among a crowd of local authorities that had little or no connection with a central organism.

Less apparent but not less grave was the disturbance among social groups founded but lately upon a kinship more or less remote and fictitious, such as clan or tribe. It is impossible to ascertain to what degree the tradition of the old clannish relations had been able to survive in Roman Gaul and Italy, although in Great Britain the history of the imperfectly Romanized Celtic lands at the beginning of the Middle Ages shows them still very strong. On the other hand, it cannot be doubted that this kind of social group was of great importance among the German peoples during the period immediately preceding that of the invasions. But the great turmoil of the conquest, together, no doubt, with certain tendencies from within, weakened these ties. Not that kinship relations ceased during the entire Middle Ages to be a human bond of immense strength. The numerous family feuds which jeopardized the active and passive solidarity of groups in all grades of the social hierarchy bear witness to the strength of these ties. So do various institutions juridical and economic. But these ties came to apply only to a comparatively restricted group whose common descent was easy to establish, namely, the family in the strict sense of the word and no longer the clan or the tribe. This group, which made room for paternal as well as maternal kinship, was not very clearly defined and most of the obligations or modes of living imposed upon its members resulted rather from habits and feelings than from legally defined constraints. The ties of kinship continued to exist very powerfully in the feudal society but they took their place beside new ties after which they tended to pattern themselves and to which they were at times considered inferior.

The social environment in which the feudal relations developed was characterized by an economic system in which exchange although not entirely absent was comparatively rare and in which the not very abundant specie played but a restricted role. It has sometimes been said that at that time land was the only form of wealth. This statement needs explanation and qualification. It cannot be denied that the paucity of commercial relations caused the very

existence of every man to depend narrowly upon his possibility of disposing in some way of the resources furnished by a portion of the soil placed under his control. But an important fraction of the population drew its revenue from the land only indirectly under the form of personal service in money or in kind for the use of the land. Moreover, the possession of superior rights to the land was for the possessor in many respects but a means of exercising an effective power of command over the men to whom he conceded or permitted the direct enjoyment of the fields. One of the essential characteristics of feudalism is that prestige and social worth sprang less from the free disposal of property than from the free disposal of human forces. But the difficulty of commercial exchange had a considerable effect upon the structure of society. The absence of an easy flow of sales and purchases such as exists in present day societies prevented the formation of agricultural or industrial salaried classes and of any body of functionaries remunerated periodically in money.

In the absence then of a strong state, of blood ties capable of dominating the whole life and of an economic system founded upon money payments there grew up in Carolingian and post-Carolingian society relations of man to man of a peculiar type. The superior individual granted his protection and divers material advantages that assured a subsistence to the dependent directly or indirectly; the inferior pledged various prestations or various services and was under a general obligation to render aid. These relations were not always freely assumed nor did they imply a universally satisfactory equilibrium between the two parties. Built upon authority, the feudal regime never ceased to contain a great number of constraints, violences and abuses. However, this idea of the personal bond, hierarchic and synallagmatic in character, dominated European feudalism.

Societies before the rise of feudalism already contained examples of relations of this sort. These did not, however, play the preponderant role that they were to assume later. Rural lordship existed in the Roman world and also at least in germ in the Germanic world. Roman society never ceased to give a large place to patron and client relationship. Around the powerful surged a great crowd of persons—at times themselves of high rank—who commended themselves to them. In addition these clientele included as a general rule numerous former slaves freed by their masters in exchange for certain obligations

of an economic nature and a general duty of fidelity (*obsequium*). Celtic society before the conquest also contained similar groups. In Germany alongside the normal relations that united the freeman to his family, his clan and his people others more transitory had grown up in the form of bands of faithful men of every origin gathered around a chief. Nourished in his dwelling, receiving from him horses and armor, they accompanied him to battle and constituted his strength and prestige. In this way people became accustomed to a certain conception of social bonds which developing in a favorable environment were to give rise to feudalism proper.

The leading features of feudalism in its fully developed form are the system of vassalage and the institution of the fief. As early as the Frankish and Lombard periods a great number of freemen of all ranks felt the need of seeking the protection of someone more powerful than themselves or of securing a decent livelihood by offering their military services to a superior. The poorest became slaves or simply tenants. But all who could cling to their dignity as men legally free and preferred not to lower themselves to the less honorable services which burdened the tenant liable to the *corvée*. They "commended" themselves *ingeniuli ordine*. Exalted persons, on the other hand, sought to surround themselves with loyal people who should be attached to them by solid bonds. Thus arose the contract of dependence most characteristic of the feudal system.

In Frankish law, at least, the relations of vassalage were established by means of a formal act to which a little later the name homage was applied (in German *Mannschaft* or *Hulde*). The future vassal placed his hands in the lord's joined hands while repeating a few words promising loyalty, after which lord and vassal kissed each other on the mouth. As this ceremony, probably borrowed from old German traditions, gave no place to any religious elements, the custom early arose of following it up with an oath of fealty taken by the vassal on the Gospel or on relics.

The obligations created by homage and fealty held as long as both contracting parties were alive. They were extinguished upon the death of either. When heredity later came into play it undermined the whole system of vassalage. But heredity itself, as applying to the vassalic bonds, always remained rather a matter of practice than of law. In case of the death of lord or vassal a new offer of homage was in every case

considered necessary to revive the tie. Being attached to concrete forms the vassalic right held bound only the two persons whom the ceremony brought face to face.

The reciprocal obligations of lord and vassal rested upon general simple principles susceptible in their details of infinite modifications and regulated with an increasing precision by local custom. The vassal owed the lord fidelity, obedience in the face of the whole world and aid in all circumstances in which the lord might need it. He supported him with his counsel, assisted him on occasion in his judicial functions and opened his purse to him in case of necessity. Little by little the cases in which this pecuniary aid—also called *tallage*—was legitimately exactable tended to become more defined and restricted to such occasions as the celebration of the knighthood of the lord's eldest son and of the marriage of his eldest daughter, ransom and so on. Above all the vassal owed the lord military service. This form of aid gradually came to predominate over all others.

In return the lord owed his man his protection; he assumed his defense before the tribunals, when there still were state tribunals; he avenged his wrongs and cared for his orphans until they became of age. Besides he assured him a livelihood in various ways and especially in the form of an economic grant generally known as a fief.

In the absence of a salary system there existed but two means of remunerating services. The master could receive his dependents in his own house, assure them food and shelter (*provende*), even clothe them; or he could assign them a piece of land upon which they might support themselves either directly or through returns received from those allowed to work it.

Of "provided" vassals nurtured in the lord's dwelling there were certainly a great number in the ninth and tenth centuries. They were still to be met with in the France of Philip Augustus. But vassals and lords early agreed in preferring the system of allotments of land, which provided the former with a greater independence and relieved the latter from the responsibility of looking after the support—particularly difficult under a rudimentary economic regime—of numerous and at times turbulent bands. Gradually most of the vassals found themselves "housed" (*chasés, casati*). The land assigned to them derived its peculiar features from the fact that it carried with it certain clearly defined services that were to be performed for the grantor. The property thus granted was at first called

beneficium. Then little by little in the countries of Romanic speech which had adopted Frankish customs this term was supplanted (to such an extent that it has left not a trace in the Gallo-Roman dialects) by a term of Germanic origin: *fief* (*fevum* or *feodum*). The possession of land without obligation to any superior was, after the Frankish period, called alodial tenure. When a freeholder of this kind felt the need of commending himself he was in most cases forced to turn over his holding to the lord and receive it back as a fief. With the more complete feudalization of society these alodia decreased in number.

As the tenure service was a general institution of the economy of the period, there always existed a very great number of fiefs whose holders were not vassals: fiefs of artisans attached to the lord, such as painters and carpenters; of servants, such as cooks and doorkeepers; of officials charged with the administration of the manors, such as mayors and provosts. But any land granted to a vassal could be only a fief. Little by little, in proportion as the class of vassals tended to be transformed into nobility their fiefs appeared of a superior condition to those that were encumbered with humbler services, and eventually the jurists inclined to regard them as the only true fiefs. The institution of the fief, like that of homage, retained its personal character and was effective only for the lifetime of the contracting parties. Whenever either of them died the concession had to be renewed in the form of the symbolic tradition of investiture. With the establishment of the hereditary principle this ceremony became the means whereby the lord collected a sum of money (relief) as the price for the renewal of the fief.

On the other hand, it frequently happened that the vassal himself disposed of the very fiefs he held from a superior lord as fiefs for his own men. This subinfeudation, in principle, presumed the assent of the grantor of the original fief, but social necessities made it more and more customary to dispense with this. Thus alongside of and to a large extent parallel to the chains of personal dependence there arose chains of landed dependence. Mediaeval law in contrast with the Roman and modern notions of landed property conceived the soil as being subject to a great number of real rights differing among themselves and superimposed. Each of them had the value of a possession protected by custom (*saisine*, *seisin*, *Gewehr*) and none was clothed with that absolute character which the word property carries with it.

The seignior, or manor, was the fundamental unit of the feudal regime. Under the name of villa it was very widespread in Gaul and in Roman Italy and in both cases doubtless went back to very old traditions such as those of village or clan chieftains. The seignior usually consisted of several small farms. The cultivators were not the owners of the land but owed various duties and services to a lord who exercised over them a general power of command and from whom they held their lands on condition of a renewal of the investiture and the payment of a certain sum with every mutation. Generally in the Frankish period the lord also possessed a vast farm, the demesne, whose cultivation was assured in large part by the corvées due from the tenants. After the twelfth century these demesnes, chopped up into small farms, decreased in importance, first in France and Italy, more slowly in Germany, and the lord tended to become a mere receiver of land rents.

In gathering round the seignior humble folk obeyed the same need of protection that men of a higher rank sought to satisfy in vassalage. The small peasant handed over his alodium to the lord and received it back under the form of a tenure with dues and corvées attached. Often he pledged his person and that of his descendants by the same act, thus entering into personal service. The life of the seignior was regulated by custom. As the lords had every interest in keeping their lands peopled, the habit speedily arose of considering the peasant tenures, even the servile ones, as hereditary. Again, the seignior fortified itself in the feudal period by appropriating a great number of state functions and by assuring the remuneration of the military class, which tended to rise above the others.

The churches figured among the principal possessors of seigniories. Some of them from the end of the Roman Empire obtained the right to retain the taxes levied upon their subjects. These privileges, confirmed and extended to churches more and more by the Frankish sovereigns, were the first form of immunity. This soon carried with it another advantage: the prohibition of representatives of the law—exactors and prone to be tyrannical—from trespassing upon immunized land to exercise their functions, notably their judicial powers. Analogous immunities were early obtained by lay lords.

In theory the men who lived upon a seignior thus privileged remained answerable to the royal courts; their lord was responsible for their appearance. In reality the lord more and more

tended to become a judge; he always had been so for his slaves, who at least in their relations to one another and to their master were answerable by the nature of things only to him. On the other hand, his role as protector seemed to confer upon him the right to maintain good order among his free tenants and his vassals. Under Charlemagne the state itself considered his intervention a guaranty of good order. After the fall of the Carolingian state the judicial power of the lord found a new lease of life in the usurpation of public functions, itself the consequence of the utilization of vassalage by the sovereigns.

In the Frankish period all freemen were liable to military service. But more and more the strength of armies seemed to center in horsemen equipped with complete armor and serving as leaders for little bands of other horsemen and of footmen. To remunerate the services of these knights, who accompanied them to the royal army or aided them in their blood feuds, the noblemen had acquired the habit of distributing fiefs among them; and, to make sure of their fidelity, of requesting homage. The sovereigns soon did the same. Notably Charles Martel, engrossed in his struggle against the Arabs and domestic enemies, created numerous military fiefs, carved largely from the domains of the churches which he usurped. Commendation, which had in the beginning been a sure means for men of every class to find a protector, tended thus to become a social tie peculiar to a class of military vassals (of the king or the nobles), who were at the same time possessors of seigniories. By a parallel tendency the old ceremony of the delivery of arms, a heritage from Germanic traditions originally distinguishing the majority of all freemen, now applied only to specialized warriors. This was the "dubbing"; whoever had received it could give it in his turn and thereby make knights. This class, until the twelfth century still open to adventurers of every origin, had an ethics of its own, a code of honor and fidelity tinged more and more with religious ideas, and felt itself to be virtually an order.

On the other hand, to reward their representatives throughout the country, in particular the counts, the kings, not being able to put them on salary, distributed fiefs among them consisting either of lands or of a share of the royal revenues in the provinces. To bind them by a tie that had some strength they chose them from among their vassals or exacted homage of them. The royal vassals in their turn and the churches surrounded themselves with their own vassals and

confided to them a part of their functions and the administration of a part of their property.

Social and economic conditions thus made for decentralization and produced a veritable parceling out of all the powers of the state, such as justice, the right to coin money, tolls and the like. The profits accruing from these powers fell not only to the former direct representatives of the state, such as the counts, or to the immunized churches, but also by a sort of secondary appropriation to the representatives of these first usurpers.

The introduction of the principle of heredity into the feudal system was of paramount importance. The lord, who had need of men, sought to retain the services of the dead vassal's sons. The vassal's son was usually quite willing to do homage to his father's lord, in whom he found a natural protector. Above all it was at this price alone that he could keep the ancestral fief. In fact heredity was adopted little by little as a rule of conduct demanded first by public opinion, then by custom, and the lord who demurred ran the risk of offending his men. Charles the Bald considered it to be normal. In Italy the emperor Conrad II established it as law for fiefs below those of a count. Neither in France nor in Germany was it ever the subject of any legislation. In France it was early made general with but few exceptions and in Germany it was adopted more quickly for fiefs of a lower order and more slowly for fiefs of greater importance.

At the same time that they became hereditary the fiefs tended to become alienable. Of course the lord's assent would always be necessary for alienation. But it became less and less admissible to refuse it. The fiefs, together with the authority attaching to them and with the fragments of state functions that often went along with them, became hereditary, resulting in a confusion of powers over men and things. Heredity, however, while it put a seal on the feudal system certainly compromised its very foundations.

In all consistency the vassal system would have required each vassal to have but one lord. That was the very condition of the entire devotion which was the first of his duties, and the Carolingian legislation had so decided. But it was a great temptation to take fiefs wherever one could get them; when the fiefs had become patrimonial it sometimes happened that a vassal received by inheritance or purchase a fief that was held from some lord other than the one to whom he had first done homage. Cases of vassals of

two or more lords are found from the tenth century and they become more numerous in the later period. How was one to apportion obligations to the various masters? In France in the eleventh century the custom arose of choosing one of these allegiances as more binding than the others. This was called liege (pure) homage. But in the thirteenth century this system, in its turn, was rendered ineffectual by the very multiplication of the liege homages offered by the same vassal to different lords. One was then reduced to consider, among the liege homages, which always took the first place, and, among the simple ones, the first homage in date, or sometimes the one attached to the greater fief as the strongest. In Germany and Italy, where the liege homage never took root, these classifications by dates or according to the importance of the fiefs had always been in vogue. But such multifarious allegiances could no longer count for much.

An essential characteristic of the feudal contract was the theory that if one of the two contracting parties broke his pledges he thereby freed the other party from all obligations. But precise definition as to the circumstances under which non-fulfilment of the contract, whether on the part of the lord or of the vassal, justified the rupture was completely wanting. In spite of the efforts of Carolingian legislation this salient point remained vague. The absence of all recognized superior authority left it to the interested parties to arbitrate the particular case. This uncertainty, the unforeseen consequence of the synallagmatic character of the bond, smoothed the way for all kinds of felony.

Although the salient features of the feudal regime were very nearly the same in all countries of western Europe there were, nevertheless, certain national differences and peculiarities. Thus in France the parceling out of the powers of the state, notably the appropriation of justice, was carried farthest. There too the military class became most solidly constituted and developed its chivalrous code, which from there spread over all Europe. In Germany feudal conceptions did not pervade the judicial life so profoundly, and two codes of customary law developed side by side, the general laws of the different countries (*Landrecht*) and the laws of fiefs (*Lehnrecht*). The *allodia* there, as in Italy and the south of France, persisted in greater numbers than elsewhere. The exclusive right to invest the superior judges who dealt with criminal cases involving the death penalty remained in

the hands of the royal power. The emperors also maintained a long and effective struggle against the inheritance of the great fiefs. But they had to accept the obligation to enfeoff again the fiefs having the powers of earldoms when they were left without heirs or had been confiscated. This, unlike the case of France, prevented the increase of the royal domain itself. In Italy the previous importance of the cities and the urban habits of a great part of the knights themselves early created a formidable rivalry to the powers of the landed lords.

In Russia a real feudal regime was in full process of development up to the moment when it was stifled by the power of the Muscovite state. As in the west, the vassalage of the boyars became transformed into a state nobility. They were, however, more strictly subject to the czar since the synallagmatic character of the contract of service had always been less marked than in the west. The seignior, vigorously constituted, survived for a long time. In the Byzantine state of the first centuries there existed tenures burdened with military service for the state but these were tenures of peasant soldiers. The emperors viewed these free peasants as constituting the strength of the army and struggled against their being crushed by the seigniories. From the eleventh century their resistance weakened and finally the seignior, favored with immunities and obliged by way of compensation to furnish soldiers to the state, became the keystone of the military organization. But these seigniories were not themselves subdivided in hierarchical form by bonds of fiefs and vassalage; so that one of the essential characteristics of feudalism—that gradation of obligations which in Europe preserved the homogeneity of the political organization—was always lacking in Byzantium. The Scandinavian peninsula offers a clear case of a country in which for want of one of the primary elements of feudal organization, that of seigniorial economy, a real feudalism failed to arise.

Much more significant is the distinction between countries in which feudalism had grown up spontaneously and those in which it had been planted by conquest. In the former the feudal regime was never able to attain that systematic character that hardly belongs to any but institutions formed fully accoutered and thereby unembarrassed with survivals. It appears, on the contrary, as a much more symmetrical edifice in the countries in which it was planted by conquest, such as the Latin states of the Holy

Land, the Norman kingdom of southern Italy and especially England.

The social condition of England at the time of the conquest was in many respects analogous to that of Frankish Gaul at the time when the feudal system began to take shape. Both were marked by a slow absorption of the free peasants in the framework of a seignioriness whose dependents still obeyed juridical statutes of extreme variety, by a tendency toward the generalization of dependent relations, by the appropriation of justice by the powerful, by the existence of tenures burdened with military service and called as in Germany *Laen*, and by the importance of the thanes, a class fairly similar to that of the Frankish royal vassals. But all that was poorly coordinated and the fusion of the relations of fief and vassalage had not been effected. The Norman kings imposed upon the country a feudal system conceived to their advantage. The boundaries of the seignioriness (called manors) were definitely fixed; a sort of serfdom was introduced which, however, was in the course of time to evolve in a very different direction from the French; in spite of the much greater power of royal justice than in France the English lords were considered the exclusive judges of their tenants in their relations with them, which was finally to prevent the inheritance of tenures. Above all, the kings divided the whole country into military fiefs according to a system brought over from their Norman duchy. The tenants in chief were each to furnish the king with a certain number of knights. To be able to do so they distributed fiefs in their turn. But these chains of dependence soon becoming practically hereditary all led back to the king, from whom in the last analysis all land was held, even that of the church (under the form of the "free alms"). The alodium, a foreign body in the feudal world of the continent, did not exist at all in England. Finally, the king could demand the oath of fealty of his vassals' vassals.

At the end of the twelfth century a profound change took place in European society characterized by the formation of classes, economic transformations and the development of the state. In the tenth or eleventh century society consisted primarily of groups of dependents. As the sense of personal ties wore away, the human mass tended to organize itself in large classes arranged in a hierarchy. Knighthood became hereditary and changed into nobility. In England indeed the noble never had precise lawful privileges clearly separating him from the free-

man. In Italy, habituated to a kind of life increasingly urban, he was hardly to be distinguished from the rich burgher. In France, on the contrary, the nobility made of itself a single closed class to which only the king could introduce new members. In Germany a whole hierarchy established itself within the nobility, and according to the theory of the *Heerschild* no member of one of these subclasses could without derogation accept a fief from a man occupying a lower grade.

Beginning in the twelfth century economic exchange became more active. The cities developed and relations quite foreign to the feudal type came to light. Bound to his fellow townsmen by an oath of mutual aid, which unlike the vassal oath united equals, the townsman needed no other protector than the community to which he belonged. His social code too was quite different from that of the military vassal. Moreover, the advent of a new economic regime founded upon exchange and money payment permitted the extension of the salaried class and at every step of the social scale took away from the fief and the enfeoffment any *raison d'être* for their functions.

This economic transformation in turn contributed to the rebirth of the state. Hired troops took the place of the vassals, who nearly everywhere had greatly succeeded in limiting their obligations. Corps of salaried officials subject to dismissal were formed. Such concentration of power did not redound solely to the advantage of the kings. In France and Germany certain royal vassals had brought under their control a great number of earldoms and multiform seigniorial rights and exalted their power above the crowd of lesser seignioriness. While in France the great principalities thus formed were at last absorbed by the royal power, in Germany they well nigh annihilated it. In Italy the states formed around and by leading cities chiefly benefited from this movement. Everywhere the state, whatever its nature, was henceforth a master and protector. He who now depended only on it without "commending" himself to anyone no longer felt isolated.

The rural seignioriness lasted much longer. Being adapted to the needs of the capitalistic era it still continued to flourish throughout the sixteenth, seventeenth and eighteenth centuries; it was transplanted by Europeans into various colonies, notably French Canada. It was not abolished in France until the revolution; it disappeared definitely from Germany—aside from a

few survivals—in 1848; in England it disappeared but very slowly from the statute book and left behind a very strong imprint on the constitution of rural society.

The same needs from which vassalage took its rise long continued to make themselves felt, at least intermittently in troubled periods. The homage, now but an empty rite, had its substitutes. The English liverymen in the time of the Wars of the Roses are reminiscent of the mesne tenants of the early Middle Ages. In the France of the seventeenth century to belong to a great lord afforded the gentry the best means of getting on. The orders of knighthood were invented by the princes at the close of the Middle Ages to insure the fidelity of those admitted to them; Napoleon himself in establishing the Legion of Honor had much the same idea. But those orders that have survived, as well as their contemporary imitations, have lost every role but that of honorific distinction.

In the last centuries of the Middle Ages the states had sought to turn to account the old feudal organization, requiring of vassals if not an active military service at least a compensatory tax. But these attempts had little success. In England a law of the Commonwealth in 1656, confirmed by the Restoration in 1660, abolished all distinction between the fiefs of knights and the free tenures (*socages*). The fiction that all land is held from the crown, the use of the word *fee* to designate the highest form of landed rights, are relics of the systematic organization introduced by the Norman kings; primogeniture applied in the absence of a will to all succession in real estate is a legacy of the law of fiefs. In certain German states, such as Prussia under Frederick William I, the fiefs were transformed into *alodia* in the eighteenth century by legislative action. France waited until the revolution of 1789 to abolish fiefs and vassalage, which had ceased to bring any considerable revenue to the coffers of lords and king. In the nineteenth century these antiquated institutions finally disappeared in Europe. The class of military vassals had given birth to the nobility. In France the latter saw its privileges completely abolished along with the feudal organization itself, and by the same act its social role was doomed to extinction. But in some other countries it has long outlived the fiefs both in fact and in law.

The clearest legacy of feudalism to modern societies is the emphasis placed upon the notion of the political contract. The reciprocity of obligations which united lord and vassal and caused

with every grave dereliction by the superior the release of the inferior in the eyes of the law was transferred in the thirteenth century to the state. Practically everywhere, but with peculiar clearness in England and Aragon, the idea was expressed that the subject is bound to the king only so long as the latter remains a loyal protector. This sentiment counterbalanced the tradition of royal sanctity and finally triumphed over it.

MARC BLOCH

SARACEN AND OTTOMAN. The conditions which gave rise to feudalism in Moslem countries varied fundamentally from those under which it arose in western Europe. The economic basis of western feudalism was a natural economy, while the economic organization of the East resembled more closely a money economy. In the West the feudal system had its roots in the problem of military protection, whereas the Moslem military fiefs developed not as a means of insuring military protection, but as an abuse of the existing system of revenue collection. In the Saracen Empire of the ninth century feudal disintegration was apparently more an effect than a cause and was the result of a decline of capacity in the ruling house, corruption in the central government and the influence of mercenary soldiers.

Feudalism in Moslem countries grew out of the administration and the disposition of lands conquered by the Arabs. Governors were appointed to rule over the conquered provinces, which were known as the governors' *ikṭā'*. At first fiscal and political administration were kept distinct. The provinces paid a fixed tribute which was farmed and was in charge of the financial administrator, called the *'āmil*. With the weakening of the central government the provincial governors succeeded in becoming financial administrators as well, and as soon as this fusion occurred independent states and dynasties grew up. Egypt under the Tulunids is the most outstanding example of this process.

A similar disintegration was taking place within the provinces. In the tax districts the administration of taxes was divided between the village communities, which were collectively responsible for their taxes, and the great Arab landholders, called *muktas*, to whom the government had assigned in return for a fixed rent or tax the uncultivated lands and those deserted by their former owners. The tax farming system extended through the districts and village com-

munities. There was very little difference between the tax farmer and the large landholder who guaranteed the taxes on the land granted him by the state, for both derived their revenue from the coloni. Gradually the great landholders became the tax farmers of the districts and the two spheres of activity grew closer together. Unlike the fiefs of the West, however, these grants, or *ikṭā'*, entailed no military service; the only dues which the grantees owed were money dues.

In the course of time, however, a process of militarization took place within the empire. The Turkish slave guards with whom the Abbasides surrounded themselves grew very powerful, raided the treasury and threw the empire into a state of anarchy. The Turkish generals took over wide districts as tax farmers and great estates as emphyteuticaries, rarely turning the revenue into the state treasury. The mercenary soldiers had formerly been paid in wages, but it gradually became the custom, whenever the treasury was depleted and the soldiers grew unruly in demanding their pay, to reimburse them by assigning to them the collection of revenue in various localities. These grants to the soldiery were also known as *ikṭā'*. Gradually the estates granted to the military formed the great majority. Although technically the grants were for a limited period and only for the surplus over the required tax, in practise it became increasingly difficult to regain control of the district or to collect any funds whatsoever from the grantees. Gradually also the distinction between giving the revenue of the land and giving the land itself tended to disappear. This process went on during the tenth and eleventh centuries; toward the end of the latter century the Seljuk Turks legalized the existing state of affairs by acknowledging the right of the grantees to the entire tax or rent collection, not merely to the surplus, and by making the fiefs hereditary in return for continued military service by the heirs of the holders. This practise was introduced into Egypt by Saladin. The grantees of the fiefs were primarily, however, the beneficiaries of the revenue; their interest was not so much in the land as in the rents and taxes. The changed legal status of the fief holders tended, on the one hand, to settle the nomads and fix their allegiance; on the other, it permitted an escape from the control of the central government and became a strong force working toward the break up of the Seljuk Empire.

In Egypt under the Mamelukes the whole

country apart from private property, endowments and fallow or desert land was regarded as the feudal property of the sultan. Beginning with the reign of Kalāun (1279-90) Egypt was divided into twenty-four parts, of which four were reserved to the sultan. Out of these he gave fiefs to his personal guards, while ten were similarly assigned to the great amirs and ten bestowed upon mercenary soldiers. Redistribution was supposed to take place at least once in thirty years after a survey. Some sultans took as many as ten or even fourteen parts for their own troops.

Once perfected, the institutions of the Moslem feudal regime were analogous in many instances to those of western feudalism. In both military service became the basis of tenure and the fief holders had similar political rights over tenants. But Moslem feudalism, by reason partly of geography and climate, partly of Arab traditions embodying looser organization and partly of Moslem allegiance to the central government as succeeding to the authority of Mohammed, never developed the close knit and durable hierarchy of western feudalism. The complexity of feudal dues, prestations, succession and marriage fees did not approach that of the West.

Saracen feudalism was superseded in time by the feudal system of the Ottoman Turks. From an early date the Ottoman sultans granted land in return for military service, establishing a system which avoided the Seljuk disintegration and continued through five centuries. Practically all of the conquered territories in Anatolia and southeastern Europe were made into fiefs not only in conformity with Saracen and Seljuk custom but responding also to the Byzantine feudalism which preceded the Turkish conquest. The acquisition of Mesopotamia, Syria and the Arabian borderlands provided territory held under older arrangements, much of which was already in smaller and greater fiefs as *ikṭā'* of the *kharāj*, or tribute lands. In Egypt the lands were resurveyed and divided again as imperial estates and fiefs according to Ottoman principles. The lands in Arabia over which the sultans came to rule were tithe lands and so not subject to the feudal system. In case of the acquisition of original tithe lands by Christians such lands might be classified temporarily as tribute lands.

In the formation of the Ottoman feudal system rigid rules were laid down and were administered for some generations with considerable exactness. Fief holders, regularly called spahis, had the right of receiving the public revenues

from the lands assigned to them. With this went seigniorial jurisdiction over tenants residing on the land. The unitary fief, which was called a *kilij*, was one whose revenue amounted to 3000 aspers. Fiefs whose yearly revenue was less than 20,000 aspers were called timars; those with an annual revenue of from 20,000 to 100,000 aspers were called ziamets, and the larger fiefs with annual revenues above 100,000 aspers were called khasses, or treasures. Holders of timars were timariots and holders of ziamets were zaims. The fief holder must render military service on horseback when summoned by the sultan. From the smallest fiefs he might come alone; from the larger he must bring additional cavalymen in proportion to the amount of revenue from the lands.

The system was controlled through a hierarchy of officers who belonged to the sultan's slave family. The spahis were commanded by subbassi, who in time of peace governed the towns and whose rank in the army resembled that of captain. Next were the alai-beys, or colonels, and above these the sanjakbeys, or brigadier generals, who governed the important cities and held superior rule over the district in which they were located. The sanjakbeys were under the rule of beylerbeys, or *mirimürans*, comparable to major generals. The first beylerbey was Lala Shahin, appointed in 1362 and commanding all the feudal spahis. From 1376 this office became that of beylerbey of Anatolia, and a beylerbey of Rumelia was appointed. As the empire grew, other beylerbeys, regularly called pashas, having under them similar organizations, were appointed; but the first two, advanced to a position similar to that of full general, commanded all the beylerbeys on their own sides of the Bosphorus. At the head of the entire military organization was the sultan. In its fully developed form this system produced two great territorial armies, one in Asia and one in Europe, all of whose officers lived from lands held in fief and in time of peace exercised functions of local government.

From 1376 fiefs were made hereditary in the male line. No crime of a possessor could impair the rights of his children to succeed him. In the absence of male descendants the property reverted to the state and the beylerbey could bestow such a fief on another spahi of the same province or on some veteran soldier. There was a tendency for fiefs to increase in size, as the law permitted the timars to be united into ziamets but forbade the division of the latter. In the case

of small fiefs one son only had the right to succeed to the fief; other sons received nothing. In the case of large fiefs not more than three sons of the holder might receive small fiefs. In time of war deaths in battle led to frequent changes. Volunteers accompanying the armies competed for the fiefs of slain men by conspicuously brave deeds. The feudal spahis of Anatolia were more obedient than those of Europe, but were not so well paid, had less practise in fighting and were not so highly esteemed as soldiers.

When the Ottoman feudal system was working properly the country gentry were kept under control, the hereditary accumulation of estates was prevented and any tendency toward independence could easily be thwarted. The sultan, moreover, obtained regularly the service for which the lands were granted. In addition most of the subject Christian population was governed locally without any trouble to the sultan and was held down well and uniformly by resident seigniors. A great advantage of the system was that by the granting of new fiefs in newly conquered lands the territorial army was automatically increased in proportion to the increase of the empire.

In the sixteenth century the great Suleiman found that serious disorders had arisen through favoritism and venality in the disposal of fiefs, the distribution of which had been left to the local governors. To correct this he issued decrees that the pashas could dispose of only the smaller fiefs and that all others were to be bestowed only by imperial orders, thus once more attaching the control of the large fiefs to the central government. The central treasury took charge of such estates when they were vacant. At this time the feudal armies contained about 200,000 men. By the time of Murad III enormous abuses had appeared. Feudatories did not answer the call to arms and yet remained unpunished; pashas sold fiefs at auction, sometimes to several persons, with resulting quarrels and murders. The empire was then divided into forty-four eyalets under pashas and subdivided into 220 livas under sanjakbeys. These offices were given at first for three years, later for two and finally for one year. Theoretically this was intended to prevent too great strengthening of governors, but it also made the fortunes of ministers, who exacted heavy bribes at each of the frequent changes of office. In the course of time the pashas resumed the distribution of the larger fiefs. Mustapha II endeavored to improve the situation by again enforcing distribution

from the central government, but corruption was so deep seated that the abuse only changed its location, appearing in the office of the minister rather than in that of the pasha. When war broke out in 1768 only 20,000 feudal troops came together, the remainder of the fiefs having passed to the palace, to civil officials and to private citizens. In 1776 'Abdul-Hamid I tried to restore the old system, but such tremendous clamors arose that the plan had to be abandoned. After that time many fief holders provided payment for substitutes. The reorganization of the army on European lines hastened the end of the system. Sultan Mahmud II delivered the final blow to the military fiefs by adopting the policy of converting the fiefs, as they fell vacant by the death of their holders, into wakf, or religious foundation lands. The situation was definitely settled by the land legislation of 1856. In Egypt all the land had been taken over for the government during Mehmet Ali's reign and had been leased out again with the abolition of military tenure.

ALBERT H. LYBYER

CHINESE. Nothing is known of the beginnings of feudalism in China. According to the earliest literary sources feudalism was already in existence in the third millennium B.C. These sources, however, have little claim to real authenticity. The earliest definite and credible information concerning feudal tenures refers to the time of King Wu Wang, the founder of the Chou dynasty (about 1100 B.C. according to the corrected chronology). After that date it is possible to observe over a very long period of Chinese history the feudal principles and customs which played so important a role in shaping the character and evolution of the empire.

The form of the first grant of fiefs under Wu Wang shows clearly the character of the system. Immediately after the conquest of the kingdom of the Shang dynasty the king distributed large territories to his relatives, to several of his deserving generals and ministers, to the descendants of certain ancient rulers and to the son of the last king of the fallen dynasty. Not full ownership but unrestricted use of these tracts of land was granted, and the grantees were under certain obligations to the emperor; the grants were accordingly very similar to the fiefs of western Europe. All the fiefs were situated within the borderlands of the newly founded empire, a circumstance which cannot have been entirely fortuitous.

There were several reasons for the granting of these fiefs. The customary law of the clan obviously demanded that its members share in the newly acquired possessions of the chief. Another factor was the sacred rules of ancestor worship; a landed estate was necessary for the maintenance of the ancestral temple and its sacrifices; and generally this was conceded even to a subdued enemy. There was also the problem of defending the borderlands, and the location of the larger fiefs along the frontiers shows clearly that the feudal lords had to undertake the protection of the newly conquered territories against the warlike outer tribes.

The underlying principles of feudalism as it appeared in this period were very ancient elements in the social organization of China. They cannot have come into existence as late as the time of the foundation of the new Chou state, but must date back to a much earlier period. The constitution of the clan, demanding on the one hand the unrestricted power of the eldest in distributing the common property to the members under his supreme control, and on the other the common right of usufruct on the part of all the members together with the maintenance of the ancestral sacrifices, forms the bases upon which Chinese feudalism developed. The old Chinese state was conceived as a large family, and its character was shaped according to this notion. Thus the ruler, as the paterfamilias, distributed the territories as fiefs to his relatives and adherents, while he himself, according to the theocratic theory of the state, held the empire as a fief from God. To these religious and ethical elements were added practical political considerations. The distances in the country were too great, the means of communication too defective, to allow the collection of taxes, the administration of justice and the protection of frontiers to be controlled directly from the capital. It was necessary to decentralize the administration, and this decentralization was effected most simply by feudalism. The feudal lords were responsible for the discharge of taxes in the form of a fixed tribute and for the safety of their territories. The exigencies of administration and the protection of the country were the two powerful incentives in the development of feudalism in China as elsewhere. Part of the obligations of the feudal tenant was undoubtedly, as in European feudalism, the rendition of military service; i.e. the raising at the king's order of a fixed contingent of troops, the size of which was proportional to the size of the fief.

The legal character of the Chinese feudal system is rather difficult to define. Some scholars, influenced by the concepts of European feudalism, have been inclined to regard the Chinese feudal relationship as a legal contract by which the sovereign and the grantee were bound to mutual obligations. Such a conclusion, however, is scarcely tenable. In the light of Chinese thought it is contradictory to hold that the "son of heaven" dealt on a contractual basis with ordinary mortals; for the king or emperor of China was always not only the political ruler but also the highest priest, the mediator between God and men, a position to which no other mortal could attain. The duty of protection was rather a one-sided obligation which was enjoined upon the feudal tenants by the king, who could moreover alter or withdraw at any time the grants he had made. It must be remembered that feudal relations in China had not only a juridical but also an ethico-religious basis and that therefore they cannot be explained solely by the legal stipulations of a constitution or contract.

In the course of time, however, the ethico-religious elements in feudalism were more and more undermined and almost entirely displaced by political and social ones. The growing weakness of the central power, caused by the inability of its incumbents as well as by geographical political conditions, resulted in the feudal tenants becoming independent princes who practically refused to recognize their feudal relationship to the sovereign. Politically although not in religious theory they became his equals or even his superiors, a development similar to that which occurred in the German Empire of the Middle Ages. This course of evolution led to the overthrow of the dynasty and the thorough reorganization of the old state in the third century B.C. The earlier type of feudalism disappeared and was replaced by a unified empire under the control of a much stronger central power, whose public functionaries were in charge of the administration of the different provinces. Nevertheless, feudalism constantly endeavored to reassert itself. According to the tradition of Confucianism feudalism on account of its ethico-religious character was essential to the imperial-papal conception of the state; on the other hand, past experience had shown what an actual or at least possible danger to imperial rule its further development might prove. This inconsistency between theory and reality enabled feudalism to continue for a long time although in an en-

tirely altered form within the body politic of China. Only gradually did it disappear as a constituent element in the organization of the state. Grants of land to members of the imperial family or high functionaries after the second century B.C. were of another nature and were intended only to provide the tenant with subsistence worthy of his rank. The official's entire salary or at least part of it came from the revenues of his land grant, but sovereign powers were no longer connected with the grant or at least were no longer supposed to be. The maintenance of the ancestral temple also naturally influenced the situation.

In the course of time even this later kind of feudalism disappeared entirely. The great provinces of the empire were placed under the administration of governors who, although their legal powers were of a very wide scope, always remained mere public officials and might at any time be transferred from one province to another by the central government. The former feudal lords became the provincial satraps; this fact explains the latter's unusually wide independence.

O. FRANKÉ

JAPANESE. The ultimate origin of Japanese feudalism must be sought in the maladjustment between the Chinese regime, which was introduced in the seventh and early eighth centuries, and the primitive social habits of the nation, which reacted upon the alien institutions. Heretofore Japan's polity had in general been built upon the patriarchal organization of her ruling tribe, having its hereditary sovereign in the house father of the family, which was believed to be the main trunk of the whole tribe, and its subordinate chiefs in the heads of clans and families, which were arranged more or less in the order of kinship. As the population had grown and the territory expanded, the tribal system had become increasingly untenable; and an immense growth of clientage and of the aggrandizement of land at the hands of great families had brought the whole political scheme to the verge of dissolution. With a view to saving the country from the impending danger and once again securing the imperial power, the entire fabric of the state and society was now remade from top to bottom in a most daring and thorough program of reforms, which was almost wholly patterned after the centralized government of the T'ang empire of China.

The reforms made the emperor the apex of an elaborate system of bureaucratic administra-

tion cast in a logical and hierarchical mold. The entire free population was freed from private control and placed under the direct rule of the government. All the economic land of the country was rescued from the domanial lords and put under the ownership or at least the superior right of the state; and nearly all the rice land under cultivation was allotted equally to the people according to a plan of periodical redistribution. Immediately the ingrained native habits of the people began to react upon the artificial structure: the powerful would regain control over the persons and lands of the weak; the peasants would cling to their lots of rice land, for the success of its cultivation depended upon intensive care of long duration. These forces had to work through and around the new regime; nevertheless, they succeeded during the next four or five centuries in remodeling the elaborate organization bit by bit until at last a new sort of national life utterly unforeseen by the reformers emerged. In the eleventh century one may observe two groups of phenomena which had resulted: the progress of great private domains called *shō* and the rise of the private warrior, the two factors which were destined to be combined in this and the following ages.

The typical *shō* at its full maturity was an extensive landed possession of a noble personage or of a religious institution, which was more or less exempt from public taxation and exercised more or less jurisdiction upon its inhabitants. These domains grew immensely in number and in extent and steadily absorbed into themselves the publicly controlled lands and people, whether by purchase or exchange, by gift or commendation or by compulsion. Moreover, the private as opposed to the public point of view, which was at once the cause and the effect of the *shō*, prevailed over the country so much that even public lands and public offices came to be regarded in the light of private possessions and tended to become patrimonies of influential families. It was thus that *shō*, as also the diminishing public "domains," came to include among their tenants of lands and offices the private warriors who had also come into being.

These warriors like the *shō* were a spontaneous product of the age. The social unrest caused by the very failure of the reformed polity had increased and had compelled capable people to arm themselves for self-protection. At the same time ambitious sons of noble families, who had chafed under the enervating life at Kyoto, the capital, had descended upon the country as offi-

cials of the *shō* or of the local government; they had already multiplied and formed well organized groups of families. Among the most influential were the two clans, the Minamoto and the Taira, both descended from the imperial house. Men of this new local nobility were also armed; and between them and local warriors there gradually arose relations of vassalage much in the same manner as in the Frankish commendation and benefice. At first the innumerable groups of lord and vassal that had thus sprung into being were largely independent of one another and in that ill organized form took part in small wars that occurred in many places whether as soldiers of fortune or in the service of public expeditions. While so serving, the separate bands were by the exigencies of war and by the increasing coherence of the clan organization among the lords welded into larger and larger bodies of vassalage, at first slowly and then from the middle of the twelfth century more rapidly. Thus arose new classes, with their new moral code of fidelity and valor, which in the next ages were to be the real political masters of the nation.

In this era of scarce currency the warriors like other people could subsist only upon the land. Did the institutions of fief and infeudation therefore come into existence? Here was a singular state of things. Most of the lands that supported the warriors were neither their own alodia nor fiefs granted by their military chiefs, but, on the contrary, tenures of land and office held under the local government or under the owners of *shō*; and on this material basis the vassals served their lords in war. So the typical warrior had two masters, non-military and military; to the former he as a tenant did official service or rendered merely pecuniary dues, but to the latter he as a vassal owed personal faith and gave services of life and death; from the former he received material support, while from the latter he enjoyed the necessary armed protection and sometimes also a benefice by way of subgrant made out of the tenure which the chief himself held of a landlord or the local administration. These early forms of the fief, which would remind one of the tenures of church land that were held *pro verbo regis* by the vassals of Pepin or Charlemagne, continued in Japan far longer than in Europe and did not cease until the prolonged civil war after the fourteenth century gradually crushed the non-military domanial lordship out of existence.

In this state of fief and vassalage the feudal

control of Japan passed in 1186 into the hands of the head of the Minamoto clan, Yoritomo; for in that year the imperial government permitted Yoritomo to instal his vassals throughout the country as military governors and as collectors of local taxes and domanical dues. In 1192 Yoritomo was granted the old title *shogun* ("leader of the army," originally, sent against rebellious aborigines of the north), the title which henceforth came to be identified save for brief interruptions with the supreme suzerainty of all the vassals and rear vassals of the country. Since Yoritomo was the first chieftain who succeeded in introducing an effective control of the nation through vassal relationships, the feudal ages of Japanese history in the political sense, which were to continue for nearly seven hundred years, may be said to have begun in 1186 or 1192.

Before attempting a discussion of feudal institutions it is necessary to make clear the sequence of the political history of the successive feudal ages. Yoritomo established the seat of his feudal government at Kamakura, near the present Tokyo. The Minamoto line of shogunate continued only for three short generations until 1219, but the rule of Kamakura was maintained a century longer until 1333 under the real control of the seven successive *shikken*, or lieutenants, of the Hōjō family; they upheld nominal shoguns of the imperial or a noble house. Then followed a brief period from 1333 to 1336 in which the imperial court at Kyoto succeeded in recovering the actual government but immediately lost its control through the dissatisfaction of the feudal classes. Again was established a shogunate, this time at Muromachi in Kyoto by the Ashikaga branch of the Minamoto clan; fifteen shoguns succeeded one another until 1573; meanwhile their easy going rule and loose organization plunged the country into a period of civil war. The Muromachi period may be divided into two parts: from 1336 until 1392 the struggle for supremacy between rival factions of warriors caused the imperial house to be divided against itself into two dynasties of emperors; in 1392 the dynasty supported by the Ashikaga shogun prevailed over the other and the imperial court was again united, although its fortunes as also those of the civil nobles in Kyoto sank to the lowest depths. The civil war which now raged with increasing fury for more than two centuries and wearied and exhausted all classes of people finally produced three leaders of superior ability; Nobunaga Oda

from 1573 to 1582, Hideyoshi Toyotomi from 1582 to 1598 and Iéyasu Tokugawa from 1600 to 1616 successively carried forward the heroic work of subduing disorder and unifying feudal control. It was Iéyasu who finally gave the nation the peace it sorely needed and founded at Edo, the present Tokyo, the Tokugawa shogunate which lasted through fifteen shoguns until 1867. Their administration rigidly bound as it was by rules and precedents could not cope with the political and economic troubles that gradually accumulated nor with the unforeseen difficulties caused by the advent of foreign powers demanding diplomatic dealings with a responsible central government. The years after the visits of Commodore Perry in 1853 and 1854 saw a tremendous upheaval of reform movements, which at last brought about the downfall of the feudal regime and the restoration of the emperor as the true sovereign. With this summary sketch of the political history as a background we shall glance at a few of the larger institutions which developed and then decayed during these seven centuries.

Many a singular aspect of Japanese vassalage was due to the abiding presence of the emperor as the sole fountain of all sovereign rights. This fact had constituted the basis of the great reforms of the seventh century; when the reformed polity had slowly died, the theory of imperial power survived. It was the sovereign who sanctioned the office of shogun and enabled the latter to give his feudal rule a hierarchical organization; and whenever that structure was weakened it was again loyalty to the imperial authority which was invoked as the justification of all movements for feudal unity and control and finally for the overthrow of the feudal regime itself.

When the shogunate first made its appearance its control over the warrior classes was very incomplete, for the suzerain's immediate vassals still held tenures under non-military lords and rear vassalage was still poorly developed. Then vassalage slowly advanced and embraced more warriors hitherto unattached. Feudal evolution was, however, much confused in the middle of the fourteenth century, when many opponents of the suzerain followed the non-military government of the rival imperial court. The shogun of the Muromachi age proper saw for a moment a perfect feudal hierarchy formed under his supreme command; for now almost all warriors had become vassals of some lord or other, while at the same time the domanical lords of the *shō*

and the local civil governors had nearly disappeared under the impact of war. The shogun and the baron, who had formerly been mere protectors of their vassals' fiefs, had gradually become their real grantors; the true fief—that is, the fief which was given by the lord out of his own fief or alodium to the vassal—had thus come slowly to prevail. Soon, however, the shogun lost hold of the political situation and the unitary hierarchy split into many regional hierarchies under warring lords; these ruled over vassals and peasants like autonomous princes. The worst state of anarchy was reached in the sixteenth century.

When Nobunaga and then Hideyoshi rapidly gathered up the military forces under their unified control they built their regime upon the existing state of society, in which men and land had been as completely feudalized as was possible; but they, especially Hideyoshi, held down the local barons with a strong hand, while permitting them to retain their seigniorial powers so long as their fidelity and service toward the suzerain were irreproachable. The public powers of suzerain and baron were firmly established, but the personal rights of the vassal in relation to the lord, which had risen hopefully during the civil war, were rudely curbed.

Such was the regime which Iéyasu, the Tokugawa shogun, inherited and perfected. He and his immediate successors carefully elaborated rules and institutions of government and built up a polity in which feudal and centralizing forces were combined and balanced with great ingenuity. Under this system the baronies (*han*) remained throughout as self-governing as before; but at the same time the shogun's autocratic control over them was even more thorough and effective than that of Hideyoshi. The shogun also created large domains for his immediate support, which he administered bureaucratically, not feudally. The barons (*daimyō*), on their part, generally copied this pattern in their respective spheres: they too became more or less autocratic lords and therewith combined the capacity of territorial princes.

It has been intimated that the true fief developed and prevailed in the period of civil war. The full differentiation of the warrior class from the peasantry took place somewhat earlier, in the course of the Kamakura age; and then its special privileges as a class rose steadily until it was during the shogunate of Edo raised in legal status far above the commoners. There are certain peculiarities of the class of warriors, or

samurai (literally, attendants or servitors), as they were called, in comparison with the chevaliers in mediaeval Europe. In Europe, generally speaking, the vassal and the chevalier were after a time one and the same person, and then from the thirteenth century there were a great many vassals who were not chevaliers; in Japan, on the contrary, once vassalage had triumphed, there existed few samurai who were not vassals, save the men who were by chance momentarily thrown out of feudal relations. Nor were there, as was usual in Europe, vassals who had plural lords at the same time; questions of ligeance were here practically non-existent. The samurai's moral tenets, called sometimes in late feudal ages *bushidō* (the way of the warrior), present at once similarities to and differences from the attributes of European chivalry. The fundamental principles of personal faith and of personal honor in relation to it were common in both, for their origins and causes were much the same tradition and the same social needs and class interests, and the principles of *fides* were by no means a peculiar heritage of the Germanic races only. But the special virtues based upon personal faith which were demanded of the samurai and the chevalier were singularly different. The former was bound to far more than his contractual obligations and owed to his lord an absolute and unlimited devotion. As for lapses from mere duties, they were many and flagrant during the civil wars but were, particularly in the last period, swiftly and severely punished by a relentless system of sanction. Such one-sided emphasis upon the vassal's virtues is a proof of the peculiar spiritual heritage of the race, as also of the peculiar character of the Japanese feudal contract, a discussion of which would take us too far afield. A corollary of the doctrine of duty was the accurate control of detail in the daily life of the samurai: he should at all times have a perfect mastery of the circumstances which were within his control, so that when a supreme moment of sacrifice supervened he should instantly accept it without leaving to lord or peer any possible cause for embarrassment. Finally, a remarkable contrast with European chivalry is seen in the absence of the cult of the woman. What may be said to have taken its place in the *bushidō* was a ready understanding of and sympathy for the feelings of one's comrade and enemy—the enemy always included. This the samurai had inherited from the earlier ages when men and women of the court nobility cultivated what they termed *mono*

no aware (feelings of things); the warrior deepened its meaning into a code of *bushi no nasaké* (the samurai's compassion). The resultant discipline of these and other moral qualities, strongly fused as they were in the crucible of war and of rigorous mutual sanction, was, when the feudal regime had passed away, translated into a staunch loyalty to the emperor and devotion to the country and has in this new form proved thus far an invaluable asset of the nation in its new career of struggle and ascent.

From the middle of the nineteenth century Japan saw a great national upheaval which after a bewildering succession of events swiftly and completely swept away feudal institutions and laid the foundations of a totally different regime. The primary motive force for the general change was the imperious need which was universally felt of effecting national unity in the face of foreign aggression; this was immediately followed by an ardent desire to compete with the western powers with the very weapons with which they confronted Japan. But the feudal system could hardly have been broken with such rapidity and thoroughness had it not been for the fact that it had been long outworn: the use of money and the growth of commerce and capital had for centuries been slowly loosening the feudal fabric of society; and the institution of the emperor, which had often seemed incompatible with the shogunate ever since its beginning, had remained as a potential rallying ground upon which the elements of discontent could find a common justification. The rigid structure of the Tokugawa shogunate after more than two hundred and fifty years of existence had grown out of joint at some crucial points, especially in the balance of power between the baronies and in the hierarchical order of the vassal classes: some baronies had passed beyond the central control, and almost everywhere the ability and courage for action were found much more in the lower strata of the samurai than in the higher and also in the men of dispossessed fiefs, whose numbers the autocratic shogunate had been multiplying, as it now saw, to its own injury. *Bushidō* had trained loyalty at the expense of initiative and the spirit of adventure, but it was precisely these latter qualities of which the lower and outlawed samurai appeared as an embodiment; and with these they combined that disciplined sense of sacrifice which in its new forms often meant a desire fearlessly to go about doing things, no matter what, which they considered as disinterested. At first extremely confused,

their motives and aims gradually clarified themselves and impelled them to the accomplishment of definite ends, first destructive and then constructive.

The first great destructive effort was directed against the shogunate. The movement was inspired chiefly by men of the two strong baronies of the south, Satsuma and Chōshū (Nagato), which had long been half hearted in their allegiance to the suzerain; often at odds with each other, they were finally united. Men of some other southern baronies and many unattached samurai bent their energies in the same direction, using whatever pretext they could seize upon to embarrass the authorities at Edo, although not always in concert and not always under the leadership of Satsuma and Chōshū. At length in 1867 the last Tokugawa shogun, Yoshinobu (Keiki), surrendered his governmental powers to the emperor; he was at once deprived of his office and rank and in the next year retired into a pension fief which the imperial government granted him.

The shogunate was no more, but there still continued the old baronies and vassalage; in them were vested the entrenched interests of half a million armed samurai and their dependents. The surprising success with which these formidable historic institutions were obliterated must be attributed to the enlightened public spirit with which their long training in *bushidō* inspired many lords and vassals. In 1869 the barons of Satsuma, Chōshū, Hizen and Tosa, all of the south, voluntarily returned to the emperor their land and their public powers, which they declared their forefathers had "usurped" from him; the example was followed by many others and then forced upon the rest in 1871. The 263 baronies were reorganized upon a semifederal basis under imperial control, and the men of the old feudal classes were left as administrators and as holders of fiefs and pensions in the improvised seigniories. This system, whose incongruity with true national unity was obvious, was soon destroyed root and branch and replaced by a radically reconstructed, centralized system of administration. Between 1871 and 1874 a national army was created by conscription of all classes of people; beginnings were made of a new law and a new system of courts completely replacing the feudal jurisdiction; the currency, the land tax and popular education were likewise started on novel principles; and preparations for a new national constitution and even agitations for the establishment of representative assemblies be-

gan. Soon after, the samurai were disarmed and their revenues were redeemed by public bonds representing a total capitalization which, based as it was upon the samurai's own claims, was far below the real value of their old fiefs and pensions. Thus was the historic feudal regime of Japan eradicated rapidly and thoroughly and without great injustice.

The sweeping revolution was not accomplished altogether peacefully. The shogunate offered feeble armed resistance near Kyoto, but the great battle which impended at Edo in 1868 was happily averted by a remarkable personal understanding between a few men on the imperial and the feudal sides. Certain conservative baronies of the north which still held out against the new government were easily reduced by force in the same year.

FEUDS are relations of mutual animosity among intimate groups in which a resort to violence is anticipated on both sides. The historical blood vengeance feud (*q.v.*), common in primitive society, constitutes the most characteristic feud pattern. The family feuds which are to this day frequent in certain isolated regions are closely related to it, and many other forms of violence in contemporary society are also complicated by elements highly reminiscent of the true feud. While there is no actual historical continuity between the primitive and the modern feud, there is in many respects a continuity of pattern. The chief difference is that while the blood vengeance feud was itself the expression of primitive law, the modern feud is at least formally illegal and characteristically fills the interstices left in the functioning of the prevailing system of legal organization. A feud element is to be found in racketeering, which abounds where an opportunity exists to organize a market which remains active although under the ban of the law or which cannot be organized due to legal obstacles in the path of organization. The inspection of the racketeer and his mob frequently discloses the presence of many intimate ties which add to the business of violence the fillip of inter-racial or interfamily rivalry. Italian gangs in bootlegging wars in Chicago are often aligned against Irish gangs and the members of one clan battle the members of another. Personal loyalties to particular gang chiefs or to members of an old club stand out prominently in the history of organized violence. Armed conflict between the warring business factions becomes glorified and not infrequently distorted by the complicating motives of a more intimate and less calculated nature. Those who fall by the wayside are often those who have allowed "sentimental" considerations to mislead them into overestimating their power and into refusing to accept a working arrangement while yet there was time and opportunity.

The family feud is distributed chiefly where isolation and sparseness of population have developed a tradition of legal self-help. It is characteristically associated with the Balkans, Corsica, Sicily, Scotland and the southern mountain areas of the United States. The latter, the most spectacular feud areas in the United States, are isolated localities where self-help was once the dominating necessity and where decentralized judicial administration has enfeebled the enforcement of the law. The notorious Hatfield-McCoy feud may be taken as typical. It was fought out between families which lived on opposite sides of a small river fork which separated Kentucky from West Virginia. The land where they lived had been prized by several Indian tribes for its game, and the early settlers unprotected by any official authority did their own hunting, farming and fighting. They adopted the fighting tactics of the Indians, who shrewdly took advantage of the cover offered by the forests. During the Civil War property was endangered by marauders from both armies and the Hatfields and the McCoy's organized separate bands to protect themselves and their neighbors. Although on the same side of the conflict, these bands frequently brushed with one another, but it was not until fifteen years after the war at an election quarrel that the feud broke out. Each family had been so long isolated that it was related to nearly everyone in its own vicinity, and it was utterly impossible to secure the punishment of a Hatfield on the Kentucky side or of a McCoy on the West Virginia side of the line. Each side was reenforced by desperadoes who were fugitives from justice in more settled communities. They all gloried in the unbounded freedom of their lives; indeed, one reason for the rekindling of the feud pattern is precisely the vivid excitement which accompanies the release of primitive human impulses and the revival of the code of an earlier epoch.

Something of the primitive immediacy of the feud appears also in the relations between races and nationalities whose relative status is undergoing rapid change. If the former slave challenges the economic position of the master, if the foreign wage earner applies for a job, if the foreign cultivator possessing a low standard of life bids for a farm, if the foreign manager operates a plantation and disregards local law and custom, if, in short, any sudden upset occurs in the existing pattern of claims for freedom of movement, for income or for deference, there arise the probability of violence and the growth

of malignant hostilities between the opposing groups. Wherever social change begets social conflict the way is open for the appearance of primitive ways of adjusting grievances. Only a few individuals may be adversely affected to start with, and their claims for aid through regular channels have small chance of success in the confusions of the novel situation. The difficulties which arise piecemeal from the exigencies of those who are early affected and who are inequitably burdened by the strain of social development are those which provoke the appearance of local violence, in which personal, family and other intimate differences and affiliations may reinforce the motives to assertive action.

Quarrels within a group pass by easy stages into feuds, which are particularly intense just prior to the dissolution of the unity of the group. The controversy may be essentially trivial in its origins, yet it may occur at a time when the energies of the group are nicely balanced, and thus at once threaten the integrity of the whole. Under these circumstances virulent hatreds are aroused and directed against factional opponents or contending parties. The general sense of danger to the whole fabric of the social order renders it more difficult for each individual to keep his own repressed disloyalties in check. This leads him to project his own disloyalty upon his opponent, thus aggravating the situation.

It is notorious that feuds continue long after the precipitating episodes are lost in oblivion and that every participant is keenly sensitive to matters of honor. A by-product of the feud relation is the relatively permanent concentration of affects upon non-practical matters. There arises a state of continuing sensitiveness about ceremonious deference to emblems, names and associated prestige symbols. The members of each party to the feud are intimately locked together in the bonds of mutual identification, able to get on unusually well with one another just so long as they are able to externalize their aggressions against an outside party. Instances of failure to accept opportunities for aggression threaten the whole structure of intimate understanding, and the aggression turns back against those closely connected with the group. The relinquishment of personal autonomy which is necessitated by the feud can be sustained only when ample targets and occasions of aggression against the outside group are offered. Hence the supporting motives to the cult of honor.

Although it is possible to point to isolated remnants of the feud, modern society has many

elements which are radically incompatible with it and which have contributed to its decline. Industrialism, intercommunication and urbanization have altered both the geographical and the imaginative worlds in which men live. Loyalties to primary associations have been disintegrated through the scattering of families, the growth of new preoccupations and the emergence of larger social aggregates. The decline in the feud pattern can be traced among peoples who have shifted their habitat from rural oppression to comparative urban independence. After a spectacular flare up in the United States the "Molly McGuires" decayed among the Irish immigrants, as did the Mafia among the later Italian immigrants.

The enterprises of those who promote the large secondary patterns of society may be cut across by "private feuds." State and church are consequently hostile to the "petty" loyalties which sustain the feud. Even in the field of international relations, once marked by "private war," violence has been regularized to conform to the exactions of the modern state system and to diminish the role of spontaneous efforts for "justice" and "honor."

FEUERBACH, LUDWIG ANDREAS (1804-72), German philosopher. In initiating the naturalistic reaction to the absolute idealism of

Hegel, Feuerbach fathered various schools of aggressive materialism which profoundly influenced the tenor of philosophical, political and social thought in Germany. He began his career as a Hegelian but soon rejected the system as a disguised theology which sought to deduce and justify by dubious logic the empirical, non-rational facts of experience. Proclaiming the necessity for a reform of philosophy he urged that man and man's psychological needs be taken as the starting point of all social and philosophical thinking.

Feuerbach's *Das Wesen des Christenthums* (Leipsic 1841, 2nd ed. 1843; tr. by M. Evans, 2nd ed. London 1877) contained a revolutionary interpretation of theology and converted the left Hegelians to a vague humanistic materialism. He contended that the essence of religion is human feeling, that man in worshiping God is unconsciously worshiping an idealization of himself. Theology is an intellectual sublimation by which man attempts to gratify his feeling of want. Marx and Engels criticized Feuerbach's psychology of religion on the grounds that it was unable to explain the fact that men have different religions at different times and places and that religious feeling itself is a social product. They also took Feuerbach to task for substituting a new religion of humanity for outmoded theology.

Feuerbach's sensationalistic materialism was even more influential in combating orthodox religion than was his religious psychology. Mole-schott, Büchner, Vogt and other scientific popularizers who played important roles in the free thought movement avowed themselves his disciples. Mind was declared to be a derivative product of the body and the whole content of man's consciousness was explained as the automatic effect of the external world upon his sense organs. Marx criticized the static nature of Feuerbach's materialism and upheld the activity of the mind and the power of human beings to react upon their environment and transform it. Feuerbach's "vulgar materialism" prevented him from adequately explaining social and historical events. The incidence of the Feuerbachian doctrine that man is a creature of his physical environment was primarily political, as is shown by his attempt to offer a food chemistry as a social panacea: "We can see the important ethical and political significance which the doctrine of foods has for humanity . . . Human fare is the foundation of human culture and sentiment. Do you want to improve the people? Then in-

stead of preaching against sin give them better food. Man is what he eats" (Review of Mole-schott's *Lehre der Nahrungsmittel*, reprinted in *Sämmtliche Werke*, vol. x, p. 22).

Feuerbach's social epistemology and anthropomorphic metaphysics contain in *nuce* many of the views later developed by Dilthey, Durkheim and more recently Heidegger.

FEUERBACH, PAUL JOHANN ANSELM VON (1775-1833), German jurist. Feuerbach studied at the University of Jena, where he became first an instructor and later a professor of law. Subsequently he taught at Kiel and at the Bavarian University of Landshut. In 1805 he was appointed to the Bavarian Ministry of Justice and commissioned to draft the new criminal code. He resigned in 1814 to become second president of the Court of Appeals in Bamberg; from 1817 until his death he was first president of the Court of Appeals in Ansbach.

Feuerbach was an outstanding figure in the history of German criminal law. His scientific works bear the imprint of the great intellectual currents of his time and he was obviously influenced by the theory of natural law and by the zeal for rational reform which characterized the Enlightenment. It was to Kant's method of critical philosophy, however, that he was most responsive. Kant's sharp distinction between legality and morality was reflected in Feuerbach's *Kritik des natürlichen Rechts* (Hamburg 1796), which attempted to establish the fundamental independence of law as against morality and which opposed the claims of the criminal law to punish the immoral state of mind as such. This point of view accounts for his passionate opposition to Stübel and Grolman's doctrine

of prevention, which made a precautionary defense against dangerous characters the goal of criminal law.

Feuerbach's attitude toward legislative reform was expressed in his *Revision der Grundsätze und Grundbegriffe des positiven peinlichen Rechts* (2 vols., Giessen 1799–1800), a work based upon a narrowly juristic conception of criminal law. Penalties were to be inflicted only where there was an infringement of law, and strict legal retribution was justified by its double aim of protecting the community through its deterrent effect upon crime and of fixing limits for the state's punitive power. Thus the categorical imperative of the Kantian criminal law of retribution found with Feuerbach its justification in the aims and tasks of positive law.

Feuerbach's principles were embodied in the Bavarian criminal code of 1813, which he prepared. It was an epoch making work in German criminal law and was adopted by several other German states. Based upon the theory that a penalty can be meted out only where the law actually provides for it, the code was a logically articulated penal system with graduated penalties and with a clear legal statement of the grounds for mitigating or increasing them; each statement of facts with its fixed concepts and relative penal categories was couched in unambiguous language and left little room for judicial discretion. Feuerbach secured the abolition of torture in Bavaria in 1806, but his plans for a thorough reform of the traditional inquisitorial proceedings met with no success. Through his writings, however, he was successful in arousing an intelligent appreciation of the importance of comparative law in relation to procedure and in preparing the way for the impending turning point in penal procedure which brought with it public arraignment proceedings.

Feuerbach was also the author of masterly studies of individual criminal psychology, of which the account of Kaspar Hauser (*Kaspar Hauser, Beispiel eines Verbrechens am Seelenleben des Menschen*, Ansbach 1832; tr. by H. G. Linberg, 3rd ed. London 1834) aroused the most widespread interest. These searching literary studies of crime did not, however, suggest to their author that any psychological differentiation was necessary in the rigid schematization of criminal acts. The limitations of his aims grow increasingly apparent with the development of modern social and social-pedagogical impulses. Nevertheless, the germ of the now widely accepted indeterminate sentence is found

in the Bavarian criminal code with its provision for possible release before the termination of the penitentiary sentence. Feuerbach was the first German jurist to direct effectively the science and legislation of criminal law into the paths needed by the modern constitutional state. He insisted upon unconditional maintenance of the authority of the law and upon respect for the legal guaranties which protect individual freedom and without which protective law degenerates into lawlessness.

FICHTE, JOHANN GOTTLIEB (1762–1814), German philosopher. Fichte was born at Rammenau, the son of a ribbon weaver. He studied at Jena and Zurich and taught at Jena from 1794 to 1799. When he was dismissed on charges of atheism he took up residence in Berlin; there he helped to found the University of Berlin, of which he became the first rector in 1810. After he resigned from this position in 1812 he continued to teach at the university until his sudden death.

The originality of Fichte's ethical system consisted in the synthesis it established between the autonomous ethics originating in Kant and the French Revolution, and social and anti-individualistic ethics. At the opposite pole from the hierarchic superindividualism of

Hegel and the traditionalistic impersonalism of the romanticists and Schelling, Fichte went beyond the individualism of Kant in a transpersonalistic conception which made all moral consciousness participate in a supraconscious flux of autonomous creative activity (mind conceived as "we"). The totality derived from transpersonal activity he considered to be antihierarchical and founded on the equivalency of all the members, who were strictly individualized and indispensable; it was a totality of integration and collaboration, not of domination and subordination. The activististic transpersonalism of Fichte ended in a synthesis between universalism and individualism. He held it to be erroneous to identify the moral ideal totality with the state and not to distinguish between the society and the state as empirical reality. Society opposed as an entity to the state had specific positive values superior to those represented by the state. He insisted that the state was only a relative organization whose end was to render itself useless and to annihilate itself. In his *Reden an die deutsche Nation* (Berlin 1808, new ed. Munich 1929; tr. by R. F. Jones and G. F. Turnbull, Chicago 1922), which has been wrongly interpreted as the source of pan-Germanism while in fact the work combated it, Fichte declared that it was infinitely more important for the Germans to develop their national culture whose support was society than to dominate by external victories obtained by their state. Since he urged that the national genius be realized in the objective and unpersonifiable community and not in the will of a state, there was nothing aggressive about Fichte's nationalism; it harmonized with his cosmopolitan ideal of humanity—in which all nations were to collaborate in original ways—and with his pacifism.

Fichte was led to socialism, of which he was one of the first representatives in modern times, as a logical consequence of his activististic and at the same time anti-individualistic ethics. In interpreting liberty as a continuous creation and in considering labor as the medium through which this creation was to be realized he was led to demand positive guaranties that every man should be in a position to exercise creative liberty by his labor. Socialistic property should be, according to Fichte, identical with labor and be constituted according to the exigencies of its division: it consisted primarily in the right to follow one's professional bent freely backed by the right to the instruments of production

and the whole product of labor. Property should belong to the guilds into which the three essential professions were divided according to their specialties. The functioning of production was to be ordered by the self-government of these corporate associations and their mutual agreements. The opposition between society and the state thus played an essential role in Fichte's socialistic constructions. The closed state was neither proprietor nor producer. The autonomous economic society governed itself through the mediation of the corporate associations. Fichte's thought tended in the direction of a synthesis between liberalism and socialism, toward an anti-individualistic liberalism and an antistate socialism. It ended, however, in a state socialism and he finally attributed to the corporations a monopoly instituted by the state which uses the corporate associations as its organs. This may be explained by the fact that when Fichte elaborated his socialist theory he was under the influence of juridical individualism, which reduced every positive right to the will of the individual or the state. In perceiving that every economic organization must be regulated by law Fichte held that it must be controlled by the commands of a state, which was in contradiction to his predictions concerning the future disappearance of the state. When later Fichte rejected juridical individualism and prepared the way for a new and larger conception of law directly attached to unpersonifiable objective communities (a conception of social law which later under the influence of the Fichtean ideas was developed by the historical school of jurists, by Christian Krause and the Germanists with their theories of *Volksrecht*), he no longer had time to recast his socialistic constructions. Fichte's ideas have, therefore, acquired a double influence in the history of socialist doctrines. Through the instrumentality of Krause and his pupils, Ahrens and Darimon, who published in French, they influenced Proudhon (whose philosophy of work is entirely Fichtean) and their traces may be found in syndicalist and guild socialist doctrine. On the other hand, state socialism in Germany, not only of Lassalle but also of Rodbertus, has claimed the authority of Fichte.

GEORGES GURVITCH

Works: Sämmtliche Werke, ed. by I. H. Fichte, 8 vols. (Berlin 1845-46), together with *Nachgelassene Werke*, ed. by I. H. Fichte, 3 vols. (Bonn 1834-35), and *Fichtes Briefwechsel*, ed. by Hans Schulz, 2 vols. (2nd ed. Leipsic 1920), represent a complete collec-

tion of Fichte's writings. An edition of his selected works is that by Fritz Medicus, 6 vols. (Leipsic 1911-12).

Consult: Medicus, F., *Fichtes Leben* (Leipsic 1914); Lask, E., *Fichtes Idealismus und die Geschichte* (Tübingen 1902); Léon, Xavier, *Fichte et son temps*, 3 vols. FICKER, CASPAR JULIUS VON (1826-1902), German historian. Ficker studied jurisprudence and history in Bonn, Münster and Berlin and was a pupil of Johann Friedrich Böhmer in Frankfurt. In politics he was pan-German and deeply regretted the exclusion of Austria from the German Confederation. At the age of twenty-six he became a professor at the University of Innsbruck and taught there in the faculty of philosophy until 1862 and again from 1877 until 1879. From 1862 to 1877 he was a member of the faculty of law.

Ficker's special fields of research were mediæval history and German and Italian legal history. His knowledge of the archives of Germany and Italy was unsurpassed and his editions and critiques of these sources were contributions of lasting value. Ficker was equally important as a teacher, particularly of the auxiliary sciences and of historical methodology. He was the founder of the Innsbruck historical school and was Count Thun's most valued adviser when the latter as minister of education undertook the reform of Austria's university administration. In later years he boldly attempted to show through comparative law, independently of comparative philology, the kinship of the German peoples, maintaining that law is as characteristic of a nation as language. He saw the chief key to the genealogy of German law in matriarchy. Through his studies in comparative law he established connections between Spanish and German law. He anticipated philological-geographical research and reached fundamental conclusions concerning the relationship of law and custom and concerning the influence of custom on the development of law.

FICTIONS. In the recent reaction against physical science and its assumption of an independent reality to which ideas must conform if they are to be true, idealistic philosophers and theologians, aided by some humanistic pragmatists and dogmatic positivists, have pressed the point that the concepts of natural science such as law, cause, atom, ether and the like are mere fictions having no correspondence in nature, although they are of aid in controlling things for practical purposes. Among social scientists too there has grown up a tendency to regard abstractions like social law, the economic motive, legal sovereignty, social order and so on as fictions that have no objective significance in real life.

The subject was brought to the fore in 1911 when Vaihinger published his *Philosophie des Als Ob*, in which he attempted a survey and analysis of the fictions of the various sciences and of practical and religious thought. Interest in this field was further stimulated by the *Annalen der Philosophie*, which contained contributions from diverse specialists, especially jurists. Aside from the inaccuracy and superficiality of Vaihinger's wide learning the chief weakness of his position is that in trying to stretch the notion of fiction to cover everything he leaves no room for a valid distinction between truth and falsehood, between fiction and reality. If identity and difference, unity and plurality, and all the other fundamental categories are fictional, then every one of Vaihinger's assertions about reality, the order of sensations, convenience and fictions is itself fictional and results in a self-destructive nihilism. This, however, grows out of his unnecessary and mythical dualism between a purely

active thought and absolutely passive sensations, as if they belonged to two different worlds. If we realize that the abstract objects of thought, such as numbers, laws, perfectly straight lines, are real parts of nature, even though they do not exist as particular things but as the relations or transformations of such particulars, none of the so-called fictions of science in any way falsify its results. Because numbers or ratios are abstractions it does not follow that there is anything false or fictional in the assertion that the earth has one moon or that the rate of infant mortality has recently decreased.

The contentions of the fictionalists, however, furnish cautions against false interpretations of scientific procedures and results. Abstractions are real parts, phases or elements of things or else their relations. To identify them with things is a widespread fallacy which may be called reification.

The processes of abstraction and classification have been called neglective fictions because the class "man" does not exist and only individuals do. But it cannot be denied that such statements as "John is a man" can have significance only if the predicate denotes something really common to a number of individuals. Even an artificial classification of governments such as Aristotle's cannot be called fictional merely because particular governments do not conform to it. For existing governments may be mixed forms or combinations of the elements of monarchy, aristocracy and democracy and their perversions, and the classification helps us to recognize the significant elements of such mixed forms. Although certain elements always occur in conjunction with others and never in isolation, this is no argument against their reality. The fact that no one can be a brother or a creditor without being other things is no argument against the reality of the fraternal or the credit relation. Science must abstract some elements and neglect others because not all things that exist together are relevant to each other. Hence there is no fiction in talking about purely economic motives if we remember, as Adam Smith surely did, that in actual life these are associated with other motives.

If the reality of abstractions is recognized, then there is nothing fictional (in the sense of false) about perfectly straight or circular lines, perfectly free bodies, frictionless engines and other entities which seem imaginary and indeed are known to be impossible of separate existence. For the relation of distance between things ex-

ists in nature where the things are and is independent of the thickness of chord or chain by which it is measured; while there exist no free bodies (i.e. bodies not acted upon by any forces), all existing bodies do move in such a way that we can detect the part played by inertia and can tell what would happen if all other forces ceased to act. Similarly, while no actual engine is frictionless, we can compute from certain data the part that friction plays in the total work of any engine. It is not true that "artificial" lines of latitude or longitude are fictional merely because such lines are not actually marked on the earth. They do represent certain actual geometric relations. No map is ever a perfect picture of the country it represents. It must neglect all except a very few traits. But it may be perfectly accurate or truthful within the required limits. Another way of looking at neglective fictions such as perfectly rigid bodies, perfect distribution and the like is to view them as ideal limits. No one thing in nature corresponds to them, but classes of things do differ in degrees of rigidity or homogeneity and there is no falsity in using the limit as a real characteristic of a series.

If there is no inherent falsification in abstraction, there is none in proper scientific "construction" out of such elements. Examples of such constructions are the typical vertebrate animal, the typical river valley, the manor or factory as an economic unit and the ideal of a government by law. Much abuse has been heaped on the "social contract" as a fiction. If asserted as a historical fact it is clearly a myth. But thinkers like Hobbes have not advanced it as a historical fact. To them it is rather a logical device for analyzing actual complex social processes. If we apply the term "state of nature" to human conduct apart from the influence of laws, we can regard our actual social relations as those of a state of nature modified in certain ways analogous to the way our conduct is modified by contract. The analogy is helpful only to the limited extent to which it is true.

In its search for the truth science must formulate some anticipation of what it expects to find. Such anticipation is clearly not fictional even if it turns out to be false, provided it has been held as a hypothesis to be tested. In trying to visualize the unknown the imagination must clothe it with attributes analogous to the known. Thus electricity was first conceived as a fluid, then as lines or tubes of force, and is now viewed as a current of mutually repellent "electrons."

Thus also the mind was viewed by British associationist psychologists as an associated group of "mental states" and by William James as a "stream of consciousness." Each of these, like the various mechanical models of the ether or of various unknown physical processes, suggests verifiable analogies and thus directs research. If these directions prove false, the analogy has acted like a false hypothesis. But the term fiction may properly be applied to certain imaginary and unverifiable entities that vivify our conceptions but are strictly irrelevant to the truth or falsity of our conclusions. Thus Helmholtz' and Poincaré's one or two dimensional beings, Maxwell's "sorting demon" and similar entities in social science are really metaphors to express abstract relations. Where one of these figures is used any one of an infinity of others could be substituted, just as according to Poincaré's proof wherever a mechanical model is used an infinity of others is possible. If these metaphors are taken literally we have the myths of which popular science is full.

It must be recognized, however, that metaphors are not always invented to vivify discourse. They are often the way in which creative minds perceive things, so that the explicit recognition that metaphors are implicit analogies comes later as a result of reflection or analysis. Although indiscriminating, such primitive perception is likely to be most vivid and its apt expression may become current coin, so that it becomes difficult if not impossible to discriminate between metaphor and literal truth. As the essence of science is the search for truth, it seeks to eliminate irrelevant fictions through the use of technical terms or symbols that denote the abstract relations studied and nothing else. But as no human terms can adequately express (although they can point to or adumbrate) the unknown, science is engaged in an endless process of self-correction and revision of its language. Such a process is irksome to popular discourse and to the social sciences that employ such discourse. Language itself is a prolific source of mythology.

The foregoing analysis of metaphors will clarify the role of fictions in the primitive mind. It is a pseudo-rationalism to explain primitive animism as the result of an explicit analogy, of attributing souls to inanimate objects because they sometimes move like animated ones. Human perception is vague in its beginnings and such discrimination as that between one's own "papa" and other "papas" comes later. Thus

when a child kicks a chair against which he stumbles he does not personify the chair on the basis of an analogy. His reaction is at first directly organic, and only later does he learn to discriminate between the chair and those who are to be punished. Now if primitive perception is intellectually indiscriminating it is also organically and emotionally vivid. When such metaphoric expressions get established by usage they lose their vividness, but like other habitual practices they are difficult to change. Also words as all symbols absorb the emotional value of the things they symbolize, just as the flag or the scroll of the law becomes sacred apart from that which it denotes.

This points the way to an understanding of the fictional element in ceremonial expressions. Just as the ritual of social life demands certain forms of dress or certain steps or gestures regardless of convenience, so it demands certain accredited expressions regardless of their literal truth. Thus the rules of courtesy among the Chinese and others require the host to say always that his house is mean and that his guest is distinguished and confers an honor. Even those who do not take such expressions literally may be offended at any departure from the social mode. The role of ceremonial expressions in the outer forms of make believe is as important in social life generally as in the games of children and primitive man. The social life of a country like England may be viewed as a game that requires among other things that people should speak of His Majesty's army, navy and treasury (although the debt is "national") or that the actual leaders of the government should speak of "advising" the king when the latter has in fact no choice but to obey. Similarly it is the fashion to speak of the United States as a democracy where the law is the will of the people made by its representatives, even though few know what laws are being made or have much control over those who make them.

These considerations will illumine the nature of fictions as they appear in the field of their greatest development: the law. Here fictions appear clearly as assertions that contain an element admittedly false but convenient and even indispensable to bring about certain desired results. Although fictions border on myths which are genuinely believed and on pious frauds which are intended to deceive in aid of good causes, they can be distinguished from them. Thus when a court asserts that for the purposes of a given suit the high seas are situated in a

given parish in London, no one believes the assertion to be literally true and no one is deceived. But the fiction makes it possible for the court to acquire jurisdiction and helps the parties to settle their case in a convenient court. The Roman jurists explained such fictions by means of the Greek philosophic distinction between convention and nature. In the nineteenth century Jhering called attention to the element of implicit analogy in them. An adopted child is like a natural child in his rights and the rights of a Roman citizen in captivity may be treated as if he were away on state business. So in our own law when a deed or mortgage is recorded a really innocent purchaser is said to have had notice and is not allowed to prove the contrary. For this really means that the act of recording makes the rights of all purchasers (innocent or not) alike, so that the fact of actual ignorance is irrelevant.

Why, however, does not the law use accurate expressions instead of asserting as a fact that which need not be so? Why assert that a corporation is a person, instead of saying that a certain group of rights and duties are analogous to some extent to those of a natural person? Why say that the United States embassy in China and an American boat at sea are on American soil, when we mean to assert that certain legal relations are to be determined by the law of the United States? The answer is partly that the practical convenience of brevity outweighs the theoretic gain of greater accuracy. But more important is the fact that at all times, and not merely (as Maine would have it) in "primitive" society where legislatures are not functioning, the law must grow by assimilating new situations to the old, and in moments of innovation we cling all the more to old linguistic forms. The latter minister to the general feeling of security especially where the prevailing myth or make believe is that the judge merely declares the law and cannot change or extend it. That we can obey the law even when making it grow is more than the legal profession itself can often grasp.

From the point of view of social policy fictions are, like eloquence, important in giving emotional drive to propositions that we wish to see accepted. They can be used, as indicated above, to soften the shock of innovation or to keep up a pleasant veneration for truths which have been abandoned, as when new allegoric or psychologic meaning is given to old theologic dogmas that we no longer believe. But if fictions some-

times facilitate change they often hinder it by cultivating undue regard for the past. If the social interest in truth were to prevail, we should in our educational and social policies encourage greater regard for literal accuracy even when it hurts national pride and social sensibilities. But no one has seriously suggested penalizing rhetoric and poetic eloquence in the discussion of social issues. The interest in truth is in fact not as great as in the preservation of cherished beliefs, even though the latter involve feelings which while temporarily pleasant prove ultimately to be illusions.

FIDELITY INSURANCE. *See* BONDING.

FIELD, DAVID DUDLEY (1805-94), American jurist. Field graduated from Williams College in 1825, studied law in Albany and New York and began a lucrative practise in the latter city in 1828. He continued as a leader of the bar until 1885, when he retired.

Beginning in 1836 Field devoted all his spare time to various phases of law reform. In 1847 he framed a code of civil procedure which simplified the actions of the law and united the courts

of law and equity. This code was adopted in New York and later in other American states and in England and her colonies. A code of criminal procedure and a penal code followed, although opposition from the bar delayed application of the latter. Field's *Draft Outlines of an International Code* (2 vols., New York 1872; 2nd ed. 1876) was well received and although intended merely as a tentative draft is still cited by supreme courts in all countries on questions of international law. In the same year Field participated in the establishment of the Institut de Droit International at Ghent and also the Association for Reform and Codification of the Law of Nations (now International Law Association) at Brussels, of which he was the first president.

Field was a Jeffersonian Democrat but turned in 1856 to support antislavery, union, Lincoln and the Republican party, to return to the Democratic fold only in 1876, with three months' service in Congress. He continued to the time of his death to labor in the activities of the Free Trade League, the International Law Association and other causes.

PITMAN B. POTTER

(New York 1884-90); Rolin, Albéric, in Institut de Droit International, *Annuaire*, vol. xiv (1895-96) 310-20; Field, Henry Martyn, *The Life of David Dudley Field* (New York 1898); Phelps, Christina, *The Anglo-American Peace Movement in the Mid-Nineteenth Century*, Columbia University, Studies in History, Economics and Public Law, no. 330 (New York 1930).

FIELD, MARSHALL (1834-1906), American merchant. Field was prominently identified with the evolution of modern merchandising practises. In 1856 he became clerk and traveling salesman in a Chicago dry goods firm and was made a partner in 1861. After a series of reorganizations, in which Potter Palmer and Levi Z. Leiter participated, the firm became in 1881 Marshall Field and Company, with separate retail and wholesale branches. The growth of the business was bound up with the economic expansion following the Civil War. Chicago was growing rapidly as the industrial and financial metropolis of the middle west, where villages, towns and stores sprang up almost overnight. These changes, bringing with them higher standards of living and new business practises, Field shrewdly measured and capitalized.

In his Chicago department store Field introduced all the new retail merchandising practises

characteristic of the period—the one-price system, exchange of goods, cash sales, limited credit and extensive advertising. He appreciated the value of patronage by the rising rich upper and middle classes and catered to their demands for exclusive service by displaying high class goods amid luxurious settings in separate rooms, where purchasers would be “undisturbed by the passing throng.” Department stores were becoming cathedrals of trade, and Field led in the introduction of meretricious splendor. But he did not neglect other classes: his store was one of the first to introduce in 1885 an “underprice” or “economy” basement.

Field was an innovator in his wholesale business as well. He practised intensively buying on a mass scale and for cash. The period was one of falling prices and reckless speculation; Field imposed stringent credit terms on his customers and developed a credit system adapted to the needs of merchandising in the rapidly growing middle west. As early as the seventies Field was contracting for the whole output of manufacturing plants, dictating quality and price; offices were established in the most important world centers, where buying agreements were concluded with local manufacturers; and the company finally established its own manufacturing plants in the United States, Europe and Asia. This system, the competitive advantages of which were enormous, is now in general use by chain store organizations.

In addition to his merchandising activities Field was a power in many other business enterprises; probate of his estate revealed ownership of securities in one hundred and fifty industrial, utility and financial corporations. He left \$120,000,000 to two grandsons, both minors. The business became completely institutionalized and after Field's death it expanded rapidly; in 1929 Marshall Field and Company did a business of \$179,659,000, more than twice the business of 1906.

W., *The University of Chicago Biographical Sketches*, vols. i- (Chicago 1922-) vol. i, p. 1-34; Myers, Gustavus, *History of the Great American Fortunes*, 3 vols. (Chicago 1910) vol. i, p. 259-96.

FIELDING, WILLIAM STEVENS (1848-1929), Canadian statesman and journalist. Fielding began work on the Halifax *Morning Chronicle* at the age of sixteen and eventually became its editor. In 1882 he was elected from

Halifax to the Nova Scotia legislature; in the same year he entered the cabinet and became head of the government in 1884. In 1896 after a successful premiership of twelve years he was made minister of finance in the dominion cabinet under Laurier, a post which he retained until the defeat of the Liberal party in 1911. His tenure of office synchronized with a period of unparalleled national expansion and development, in which his financial policies played an important part. His administration was marked by a generous expenditure which was never allowed to endanger a balanced budget, numerous tariff revisions embodying a mild protection, and a constant endeavor to develop wider markets by commercial treaties with foreign countries. A notable example of the latter was the abortive reciprocity agreement with the United States in 1911.

His greatest achievement was the introduction in 1897 of the preferential tariff, which gave British goods a substantial advantage in the Canadian market. This preference was gradually extended by Canada to other dominions and to many colonies; it was also incorporated in their tariffs and in that of Great Britain. In recent years the question of reciprocal preferences has become one of the most vital problems facing the British Commonwealth of Nations.

In 1921 Fielding again became minister of finance under Mackenzie King and began the task of rehabilitating the national finances, which had been badly crippled by the war and by heavy commitments on railways. He had realized his objective of a balanced budget when illness forced his retirement in 1924. In 1923 he was appointed member of the British Privy Council, an honor rarely conferred upon a Canadian who has not served as prime minister or chief justice.

ROBERT MACGREGOR DAWSON

FIGGIS, JOHN NEVILLE (1866–1919), English churchman, historian and political philosopher. Figgis was born in an evangelical family; had a brilliant undergraduate career at Cambridge, where he was influenced especially by Maitland and Creighton; and eventually entered the Anglo-Catholic Community of the Resurrection. Except for a few years in a rural parish his career was academic in the best English sense—Cambridge, lectures in England and the United States, active participation in the life of his church, writing for a cultivated but not narrowly

professional public. Figgis was the perfect example of an English type very puzzling to foreigners. He was a most sincere Christian, but his intellect was almost skeptical and his love of paradox extreme; he was an earnest moralist but certainly not a sober one; he carried his learning with a suspicious grace. The fundamentals which Figgis defended are to most men dull and useful and are apt to be corrupted if touched by lighter gifts.

As a historian of political ideas Figgis has few peers. His interest lay mainly in "the embryology of modern politics," in that period specifically in which the clash between church and state for dominance determined the direction of modern political theory. *The Divine Right of Kings* (Cambridge, Eng. 1896, 2nd ed. 1914) and *Studies of Political Thought from Gerson to Grotius* (Cambridge, Eng. 1907, 2nd ed. 1916) deal with various aspects of this central interest and *The Political Aspects of St. Augustine's "City of God"* (London 1921) approaches it less directly. In writing of political ideas he shows them in their setting of political and ecclesiastical institutions. But he is even more concerned to reveal their lack of absoluteness in other ways—how political convenience leads to sweeping doctrine, how general ideas originate in an attempt to rationalize one's aims and justify one's position, how a doctrine created by one camp may come in time to defend the intrenchments of an opposite one. Figgis was not haunted by the modern fear that ideas have no driving force. He was content to write of ideas in the grand manner, as part of a living tradition for men of culture. He is notably fair to outworn creeds, as in *The Divine Right of Kings*, where he shows how much knowledge of men as political animals the defenders of that lost cause possessed.

Figgis' own contribution to political theory, *The Churches in the Modern State* (London 1913, 2nd ed. 1914) is one of the most important sources of the pluralist movement. To Figgis any religious group is in itself a *societas perfecta*, a corporation with a group will of its own; it is a growth and no mere creation of the state. Just as the orthodox individualist holds that men have as human beings certain rights, infraction of which by state action is unethical (and Figgis, although he does not emphasize this view, at bottom accepts it), so Figgis holds that churches have certain rights upon which the state cannot morally—and therefore lawfully—infringe. A church must be respected because it is alive, because it fulfils functions the state cannot fulfil.

Indeed, it is in the church and in other forms of corporate life such as trade unions, clubs, colleges, families (here Figgis points the way to other pluralists) that individual rights become real. Erastianism of any sort—*Kulturkampf*, the Free Kirk, the Gorham case—must defeat itself, since it is based on a false theory of the sovereignty of the state. Figgis leaves undecided the question as to who is finally to arbitrate a dispute between church and state. He would admit that the possession of armed force often makes the state sovereign in fact; his book is primarily a plea that public opinion be sufficiently enlightened to deny ethical sovereignty to the state.

FILANGIERI, GAETANO (1752–88), Italian political scientist, lawyer and economist. Filangieri, who came of a noble family, was called to the court of Naples in 1777 as a result of a masterly defense of a royal decree. Through his contact with the royal court, which continued until his early death, he was able to exercise a practical influence upon the government of Naples. His great unfinished work, *La scienza della legislazione* (7 vols., Naples 1780–85; tr. by R. Clayton, 2 vols., London 1806), seeks to portray a complete reformatory system, describing the specific content of the laws where Montesquieu had limited himself to their spirit. The work is dominated by the antihistorical rationalism of illuminism. Legislation which makes for the happiness of nations must obey needs that are rational, enduring and universal, not historical, transitory and particular. To Filangieri the fundamental human needs are essentially the preservation and security of life, mutual confidence and cooperation. The state should realize the most perfect civil society; it must for that very reason recognize the solidarity of interests that binds together nations as well as classes and parties within the nation, for the prosperity and progress of one are inconsistent with the misery and degradation of the others. To this end Filangieri proposes: an equilibrium to be maintained by a class mediatory between people and sovereign; an increase in wealth, which equitably distributed is not corruptive but creative of social values; a physiocratic recognition of the preeminence of agriculture, the basis of arts, commerce and the financial system; a definite legal system prepared by a corps of magistrates; and a system of penal law formed upon the principles of Bec-

caria. The state must not only prevent crime; it must promote virtue. Hence its task of education—a public function differing for the two classes of workers, manual and intellectual, both of which Filangieri recognizes as essential, although he calls the one productive and the other sterile. The *Scienza* evoked wide approbation from liberals and condemnation in the ensuing reaction. Benjamin Franklin praised it and interested himself in making it known in America.

FILIBUSTER, LEGISLATIVE. *See* LEGISLATIVE ASSEMBLIES.

FILIBUSTERING. The term filibuster was originally synonymous with buccaneer or pirate and was applied to the adventurers who plundered the Spanish colonies in the Caribbean in the seventeenth century. About the middle of the nineteenth century the word came to be applied particularly to those who engaged in armed expeditions from the United States under private initiative against nations with which it was at peace. The Jameson raid in South Africa in 1895, however, indicates that filibustering was not a purely American practise.

Armed incursions into nearby territory were not uncommon in the colonial period, when England, France and Spain were disputing for possession of North America, and they continued after the attainment of American nationality. Early in the nineteenth century there was much plotting in the lower Mississippi valley by adventurers who had an eye on the Spanish possessions in Florida and Texas. The so-called Burr conspiracy from 1805 to 1807 is an example. In 1810, while west Florida was claimed by both Spain and the United States, a small band of Americans captured the Spanish fort at Baton Rouge in the disputed area and was planning to seize Mobile and Pensacola when the American government's effective assertion of its claims brought these operations to an end. The revolt of Texas in 1836 led to the organization of expeditions in various parts of the United States to aid the Texans in their struggle for independence from Mexico. None of these activities is referred to as filibustering, although they resemble the later movements so designated.

The period from 1850 to 1860, which may be called the filibustering decade of American history, presented conditions peculiarly favorable to filibustering. Since 1803 the American people had seen their western boundary pushed from the Mississippi River to the Pacific Ocean, and they had grown accustomed to taking the lands next to theirs in whatever way seemed most convenient. The isolation in which they had been reared had left them lacking in that sense of international obligation prevailing among peoples surrounded by stronger neighbors. In 1850 the prospect of further acquisition of contiguous territory by government action seemed remote, but the land hunger of Americans was not yet appeased. Firm in their belief in the "manifest destiny" of the United States eventually to control both continents of the Western Hemisphere, they looked toward the fertile lands of the American tropics. If the government was indisposed to take aggressive steps private enterprise would take matters into its own hands. This general expansionist sentiment was strengthened by the desire of southern political leaders for more slave territory, in order to maintain the balance of power in the Senate between the slave and free states.

The filibusters were a conglomerate lot. Western pioneers, soldiers of fortune, political exiles from Europe, banished "liberators" from Latin America and men who were idle and adrift in the seaboard cities made up most of the rank and file of the expeditions. They were actuated by the desire for power, by the love of adventure, by the opportunities which the weak countries seemed to offer for economic exploitation and the introduction of a new social and political order and in many cases by the mere need of an occupation.

In 1850 and 1851 Narciso Lopez, a disaffected Spanish general, led two abortive expeditions from New Orleans for the liberation of Cuba. Shortly thereafter two French expatriates in California, Charles de Pindray and Gaston de Raousset-Boulbon, organized companies of their stranded countrymen in San Francisco and conducted expeditions into the Mexican state of Sonora. The Mexican authorities were at first friendly, apparently hoping to use French colonists as a buffer against rumored filibustering incursions by Americans; but later the defenders were driven out.

That there was a basis for the Mexican fear of American filibusters was soon evident. In October, 1853, William Walker, a young lawyer and

editor of Marysville, California, landed with a small force in Lower California and proclaimed an independent republic with himself as president. The American authorities cut off reinforcements and supplies, and after a few months the filibusters were driven back across the border. Walker next organized an expedition to Nicaragua in 1855, where he had been invited by one of the revolutionary factions. The aid of the Accessory Transit Company, an American concern carrying freight and passengers between Atlantic ports and San Francisco by way of Nicaragua, assured a steady flow of supplies and recruits from the United States and Walker soon became master of the country, exercising his power as commander-in-chief while a native Nicaraguan served as provisional president. This government was recognized by the United States in May, 1856. A few weeks later Walker had himself elected president. Meanwhile in a contest for control of the transit company he sided with what proved to be the weaker faction, seized the company's property in Nicaragua on the ground that the company had violated its charter, and made a new grant to his favored group. Cornelius Vanderbilt, the head of the opposing group, immediately sent agents to aid a coalition of Central American states against Walker. Vanderbilt's agents cut off Walker's reinforcements, the filibusters were surrounded by the allied forces at Rivas, and on May 1, 1857, Walker surrendered to Commander Charles H. Davis of the United States Navy, who had intervened to prevent further bloodshed. In November Walker eluded the federal authorities at Mobile and landed by a ruse under the very eyes of an American naval force stationed at Greytown, Nicaragua, to apprehend him. Commodore Paulding thereupon landed an armed force on Nicaraguan soil and arrested him. Sent back to the United States as a paroled prisoner, Walker was released soon after his arrival. Still another attempt to return to Nicaragua led to his arrest in Honduras by Captain Salmon of the British navy. Salmon turned him over to the Honduran authorities, by whom he was condemned to death and shot on September 12, 1860.

Two other expeditions worth noting in this period were those of Henry L. Kinney from New York to Greytown in 1855 and of Henry A. Crabb from California into Sonora in 1857. Kinney found Walker already in control and unwilling to share his fortune with a rival. Many of his followers deserted to Walker, and he returned to the United States. Crabb was a schoolmate of

Walker and sought to emulate his example by accepting the invitation of a revolutionary leader in Sonora to bring a force of Americans into the country. The revolutionists turned against them, however, and the entire force was captured and shot.

Filibustering never again attained the importance that it had in the fifties. Yet the Fenian raids on Canada between 1866 and 1870 and the Virginian affair in Cuba in 1873 showed that conditions favorable to filibustering had not wholly disappeared. The growing sense of international obligations among the American people, the closer commercial and financial relations between the United States and Latin America, the development of aviation and radio communication and the complex mechanization of modern warfare have all contributed to make filibustering of the nineteenth century type less likely to recur.

It is the duty of the United States government under both international law and the federal statutes to prevent the organization within its jurisdiction of hostile expeditions against friendly nations. Although so many of these filibustering expeditions succeeded in leaving the country, positive evidence of official negligence or sympathy is lacking. Many filibusters, including Lopez, Walker and Kinney, were haled before the federal courts, but public sentiment was so strongly in their favor that evidence was difficult to obtain and even when the government's case was well established juries would not convict. The American public glorified the filibusters very much as did the British the Jameson raiders.

Walker's recruits were not organized on a military basis until they had left the jurisdiction of the United States; they usually carried tickets as regular passengers on the company's steamers and the government officers were practically helpless in preventing their departure, although they searched the ships repeatedly for evidence of neutrality law violations. When President Buchanan in 1857 placed American vessels in Central American ports to prevent the landing of filibusters he clearly went beyond what was required in enforcing the letter of the neutrality laws, but this plan was much simpler than the impossible task of keeping watch on the whole coast line of the United States, and the Central American governments did not regard it as a violation of their sovereignty. The president felt constrained, however, to characterize Commodore Paulding's action in landing armed American forces in Nicaragua as a "grave error" al-

though actuated by "pure and patriotic motives."

The filibustering incursions had evil consequences for all concerned: they were destructive of life and property; they caused European governments to distrust American professions of disinterestedness in the Caribbean; and they engendered a suspicion of the United States in Latin America which still persists.

WILLIAM O. SCROGGS

FILMER, SIR ROBERT (died 1653), English political pamphleteer. During Filmer's life his works remained little noticed, but after the Restoration the Tory party found in him their best defense. His *Patriarcha; or, the Natural Power of Kings* (London 1680; 2nd ed. by E. Bohun, 1685) has survived, however, chiefly because Locke and Sidney took him as representative of the views they were attacking. To Filmer, a champion of the divine right of kings and an enemy of the claim of the natural equality of men, the argument for the need of consent on the part of the governed was anathema. He agreed with Hobbes in his absolutism but felt that the contract was a dangerous weapon in its defense. Moreover, Hobbes ignored the question of legitimacy. To avoid these difficulties Filmer developed his patriarchal theory, endeavoring to show that the description of kings as fathers of their country was not mere metaphor but literal truth. To urge indeed that contemporary rulers traced back genealogically to Adam was absurd, as he soon perceived. Nor was he very convincing when quoting Scripture to prove that unlimited monarchy was God's will. Accordingly he chose to rely mainly on the argument that monarchy was natural, showing how it originated in the power of the father over his family in primitive times and developed from that into government in the wider sense. His contemporaries, lacking in historical mindedness and inclined to view men and rights abstractly, were not easily persuaded that an account of origins constituted a justification. In short, the process of development soon rendered antiquated

the views of Filmer and of the school which he epitomized. He retains one claim to merit: his theory was, as an account of the origin of the state, more correct historically and sociologically than the fiction of a social contract so widely used by the leading thinkers of the day.

FILOSOFOVA, ANNA PAVLOVNA (1837-1912), Russian feminist leader. Born and brought up in a family of the old nobility, the Diaghilevs, at a time when serfdom was still in full force, she was influenced by the liberal reforms of the sixties. After her marriage at the age of eighteen to a high government official she devoted herself entirely to public activities, chiefly in the field of the cultural emancipation of women. With the exception of exclusive boarding schools for the nobility there existed before 1861 no schools for women in Russia and their rights were extremely limited. Outstanding women resorted to fictitious marriage, as in the case of the celebrated mathematician Sophie Kovalevski, in order to be able to go abroad for their education. Mme. Filosofova, a woman of great beauty, wit and culture, made use of her husband's prominent position in government circles, but in 1863 she was allowed merely to give popular scientific lecture courses for women in a private home. Despite her social standing in 1879 she was exiled from Russia by the police for two years. Owing to her efforts and those of her associates, Mmes. Stasova, Konradi and Trubnikova, permission was finally granted in the seventies for the opening of the Bestuzhev College for Women and later of the Medical Institute for Women. She was also instrumental in founding a society to provide inexpensive living quarters for working women. Starting with a capital of 540 rubles the society later erected its own building and shops for large numbers of working women. It founded a model trade school and a kindergarten.

Beginning in the nineties Mme. Filosofova took an active part in the International Women's

Movement and in 1899 was elected honorary vice president of the Women's Council but was refused permission by the government to establish a Russian branch. After the revolution of 1905 she organized the All-Russian Women's Congress and became its permanent chairman. As leader of the liberal wing of feminism Filosofova opposed the militant tactics proposed by the more radical socialist groups.

FINANCE, PUBLIC. See PUBLIC FINANCE.

FINANCIAL ADMINISTRATION is that part of the government organization which deals with the collection, preservation and distribution of public funds, with the coordination of public revenues and expenditures, with the management of the credit operations on behalf of the state and with the general control of the financial affairs of the public household. The term also refers to that part of fiscal science which is concerned with the principles and practises involved in the proper administration of state finances.

Several factors have contributed to the increasing importance of the administrative aspects of public finance in modern times: first, the ever widening scope of state activities and consequent growth of public receipts and expenditures; second, the democratization of political institutions and the establishment of parliamentary control over the public purse; and, finally, the recent tendency of applying a more simplified and rationalized procedure to the business of public administration.

The main principles underlying a sound system of financial administration are: unity of organization and centralized responsibility; strict compliance with the will of the legislature as expressed and formulated in the budget; simplicity, promptness and regularity of functioning; and, finally, an effective but not too complicated system of control over all stages of the financial operations. No system of administration is complete without a trained and reliable personnel, the recruiting of which is a task equal in importance to that of proper organization itself.

The various systems of financial administration are products of slow growth; their develop-

ment is closely associated with that of political institutions. For a long time England and France were the only countries which endeavored to build up a satisfactory financial administration. The constitutional law which regulates the financial administration of England is the Exchequer and Audit Departments Act of June 28, 1866, "an Act to consolidate the duties of the Exchequer and Audit Departments, to regulate the Receipts, Custody and Issue of Public Moneys, and to provide for the Audit of the Accounts thereof," supplemented by regulations contained in the Treasury Minute of March 2, 1867. In France the laws which regulate the financial administration are included in the *Règlement général sur la comptabilité publique*, the first edition of which was published in the *Ordonnance royale du 31 Mai 1838* and the last edition on May 31, 1862. Other countries followed the French or the English example; the French, adopted chiefly on the continent, is more lucid and systematic than the English, but less satisfactory. In adopting it some countries profited from experience and improved on it; for example, Belgium in the law regarding public accounts of May 15, 1846, and the general regulation concerning public accounts of December 10, 1868; Italy in the laws of February 17, 1884, and the regulation of May 4, 1885, concerning the administration and the general public accounts; and Germany in the law of December 31, 1922, concerning the regulation of the budget of the Reich, the codified text of April 14, 1930, and the ordinance of August 6, 1927, concerning the service of the Treasury of the Reich.

Of all countries Great Britain has undoubtedly worked out the most detailed and unified system of handling her fiscal affairs. The central organ of administration is the Treasury. Since 1612 the Treasury has been organized in the form of a board, consisting of the first lord of the Treasury, a title ordinarily given to the prime minister, the chancellor of the Exchequer and a variable number of junior lords of the Treasury (usually three). Actually, however, the chancellor of the Exchequer is the only head of the Treasury. Under his supervision is a trained personnel whose cooperation insures the continuity of tradition and prevents technical errors. The most important members of the staff are the permanent secretary to the Treasury, whose task it is to direct the administration, and the permanent financial secretary, who controls the other governmental departments. These two

important officials also have carefully selected staffs.

The Treasury centralizes the estimates of expenditures of all governmental departments. The chancellor of the Exchequer is the official financial counselor of the crown; he requests the appropriations for all national expenditure from the House of Commons and thus exercises a strong control over the other ministers. The House merely votes on the estimates of expenditures; its members do not possess the right of initiating expenditures or of demanding an augmentation of the credits. The credits are always granted according to the demand of the chancellor of the Exchequer.

The Treasury exercises a continuous and direct control over the financial activities of all governmental departments. In fact, the House of Commons grants the credits to the crown and not to the ministers. It is incumbent upon the crown to state whether a credit is to be used or whether certain expenditures are to be made, and the Treasury is the organ through which the crown makes its will known. Accordingly, before making any expenditure a minister must obtain authorization from the Treasury. If it is found by a department that the credits which it had obtained are insufficient, it must forward a written statement to the Treasury in order that the latter may decide whether the expenditures might not possibly be deferred or whether it could present a "supplementary estimate" to the House of Commons. Finally, it is the task of the Treasury to supervise the efficiency of all governmental departments, to which it may issue instructions.

The Treasury supervises the collection of the public revenues and the public debt service, but separate agencies are charged directly with the two respective tasks. It supervises the preservation and distribution of the public funds, which are kept in the Bank of England. The Treasury maintains a current account with the Bank, to which all the receipts collected by the agents of the revenue departments are forwarded. Upon orders from the Treasury the Bank effects transfers to the accounts of the various accounting officers, especially the paymaster general. The practise of depositing the government funds with the Bank of England helps to keep the public funds in circulation and minimizes the restrictive effect of heavy tax payments on the money market.

The comptroller and auditor general, a very high and powerful public official, although nom-

inated by the crown is considered an agent of Parliament and not of the Treasury. He can be recalled only by Parliament, and his salary does not depend upon the annual vote of credit. He takes care that the Treasury withdraws funds from the account of the Exchequer with the Bank of England only in conformity with the will of Parliament; every withdrawal of funds requires his authorization, which is known as a grant of credit by the comptroller and auditor general.

The Treasury has the power of contracting short term loans in order to balance temporary deficits. These loans are either advanced by the Bank of England, in which case they are called ways and means advances, or raised by bankers through the agency of the Bank of England (through the sale of Treasury bills). In case of productive capital expenditures the Treasury may be authorized to issue Exchequer bonds, which are of greater duration than Treasury bills and are usually repaid from the earnings of the investment.

The Treasury does not directly audit the public accounts. It publishes weekly financial statements about receipts, payments and the status of the Exchequer. In addition each year it submits financial tables to Parliament informing it of the financial situation. The auditing of the accounts is performed by a committee of Parliament, the Committee on Public Accounts, chiefly with the assistance of the comptroller and auditor general and one official of the Treasury. This committee also supervises the financial activities of the Treasury. The observations which it makes form the basis of the Treasury minutes, which are instructions forwarded by the Treasury to the various departments. A collection of all instructions given since 1857 has been published in the *Epitome of the Reports from the Committees on Public Accounts 1857 to 1910, and of the Treasury Minutes Thereon* and forms an excellent digest of English public accounting.

In France the system of financial administration is directed by the minister of finance. Until 1925 there existed unity of administration, but in that year for reasons of political opportunism there was established side by side with the Ministry of Finance a Ministry of the Budget, the principal duty of which is to prepare the budget and present it to parliament. This dualism has not produced good results. The minister of the budget is inferior in position to the minister of finance and is not superior to the other ministers. Although the latter submit to him a proposal of

their expenditures, the minister of the budget has no special power to control them. The authority and responsibility of the minister of the budget and the minister of finance are impaired by the finance commissions of the Chamber of Deputies and the Senate, which possess the right to modify the financial measures of the government. The proposals discussed by parliament are more often those of the commissions rather than those of the government. Finally, every deputy has the right to propose new expenditures as well as additional credits. The legal restrictions intended to prevent gross abuse are ineffectual. According to the constitution senators do not possess the right to propose an increase in the credits, but in practise the Senate circumvents the constitution by voting a nominal reduction of the credit. When the modified budget is again submitted to the Chamber any deputy can propose the additional credit desired by the Senate. Under such conditions the authority of the minister of finance and the minister of the budget depends entirely upon their personalities. The French budget has no responsible author; it is the offspring of an unknown father.

The Ministry of Finance does not exercise a direct, permanent and effective control over the financial activities of the other ministerial departments. Each minister uses the credits granted to him without interference from the minister of finance. Where additional appropriations are necessary, the minister of the budget demands them from parliament in agreement with the interested minister. Because of the weak position of the minister of the budget and the preponderant influence of financial commissions, deputies and senators additional credits are of considerable importance in France. In 1890 the legal power of controlling expenditure was granted to the minister of finance. An official of the Ministry of Finance, a *contrôleur des dépenses engagées*, supervises the expenditures of each minister. Every project which involves expenditures must be submitted for the countersignature of that official, who examines its conformity with the law and the credits voted by parliament, but not its expediency. The *contrôleur* has the right to comment on the efficiency of the methods employed. In case the countersignature is refused an appeal is taken to the minister of finance, who renders the final decision. A minister who knowingly incurs expenditures without the indorsement of the *contrôleur* is held civilly and criminally responsible for his action according to the law of August 10, 1922; the law, however, has

never been enforced. The *contrôleur* does useful work but lacks the authority necessary to render his services effective.

The minister of finance is in charge of the collection and distribution of the public revenues. The custody of the public funds, however, is entrusted to the Bank of France, and the money thus remains in circulation. The Treasury has a current account with the Bank, to which the revenue collectors forward the public funds. The minister of finance, on the other hand, gives instructions to the Bank for placing the necessary amounts at the disposal of the paymasters. The creditors of the state receive pay orders from the respective ministers, which are honored by the accountants only if they bear the countersignatures of the *contrôleur* and the Direction du Mouvement Général des Fonds du Ministère des Finances. The first confirms the authority of the minister in regard to this expenditure, while the second guarantees that no creditor is given a pay order without previous verification of the fact that the national Treasury contains the amount necessary for honoring it. Every month after calculating the funds at his disposal the minister of finance informs each minister of the amount up to which he may issue pay orders during the following month. The accountants are held personally responsible in case they honor orders which lack the correct form. The extent of their personal responsibility is, however, determined in the last instance by the minister of finance.

The minister of finance is the only authority charged with securing compliance with the law and the will of parliament. There exists no authority comparable to the office of the comptroller and auditor general in England to prevent the minister of finance from violating the will of parliament. He has the power to incur public expenditures regardless of their legality. His orders, even if unlawful, must be obeyed by the controllers of expenditures and the accountants. He has the power of releasing the accountants from their responsibility. Moreover, the law of August 10, 1922, authorizes the government to open credits, by a decree of the Council of the Ministers, for expenditures required in the interests of public security, providing the credits are subsequently ratified by the parliament; the fact that the government frequently makes use of this power considerably decreases the effectiveness of the parliamentary control. The legal prerequisites which insure the publicity of the financial transactions are disregarded. For in-

stance, in 1929 the public was astonished to learn that the national Treasury had at its disposal reserves of approximately 20,000,000,000 francs which were unknown to parliament. In 1930 a law was enacted which vainly tried to establish a control over the Treasury; its provisions, which are very poorly drawn, are not enforced.

The minister of finance is in charge of the administration of the national debt as well as of the issues of public loans. In order to balance the temporary deficits of the Treasury he floats short term loans in the form of Treasury certificates. Until 1928 the Bank of France gave the Treasury a standing non-interest bearing advance of 600,000,000 francs, which was indirectly abolished when the franc was stabilized.

The minister of finance supervises the public accounts of all ministerial departments and even examines the statements of the accountants before they are forwarded to the Cour des Comptes for the final verification. Actually, these statements are forwarded to the Cour des Comptes only after a delay of several years; the verification is therefore ineffective. Parliament is completely uninterested in the matter.

Although the financial administration of Germany is influenced by the French system, nevertheless German tradition favors the institution of powerful executives confronted by an impotent parliament. This tradition is evident in the very considerable power granted to the minister of finance as the head of the financial administration. His share in the preparation of the budget is larger than in France, although not so large as in England; he himself draws up the budget of the receipts and for the preparation of the budget of expenditures he utilizes the proposals which the other ministers submit to him, and which they formulate uniformly according to a model prescribed by him. He possesses the right to criticize the proposed expenditures of the other ministers. In the case of a conflict decision rests with the Council of Ministers; the minister of finance may, however, demand that the council take a new vote at a meeting at which all the ministers are required to be present. The credit requested by a minister against the advice of the minister of finance is granted only if the majority of the ministers are in favor of it and if the chancellor of the Reich votes with the majority. The plan of the budget approved by the Council of Ministers is then submitted to the Reichsrat, a body composed of delegates from the states, where it is examined by a commission headed by the minister of finance. The latter may ask that

modifications proposed by the Reichsrat be submitted to the Council of Ministers, who may approve or reject them. The project approved by the government is next submitted to the Reichstag. Although the budget commission of the Reichstag may tend to encroach upon the prerogative of the minister of finance, it lacks the power of the Finance Commission of the French Chamber and cannot propose a new budget. Every member of the Reichstag has the right to propose additional expenditures; actually, however, the right is exercised by the strong political parties in their negotiations with the government. In 1931 the regulations of the Reichstag were changed and its members prohibited from increasing credits or reducing receipts without indicating the ways and means of reestablishing a balance. If in order to comply with these regulations a reevaluation of the receipts is proposed, it must be submitted to the approval of the government. Moreover, if the Reichstag augments the credits demanded by the minister of finance, the increase must be submitted to the approval of the Reichsrat. If the latter does not render its decision or vetoes the increase the president of the Reich must either submit the matter to the referendum of the electoral body within three months or order the Reichstag to reconsider the matter; in the latter case the increase is sustained only if it is supported by a majority of two thirds. So far the second course has always been followed. Even if, as usually happens, two thirds of the members of the Reichstag vote for the increase, the president of the Reich may decree a referendum by the people. Finally, article 48 of the Weimar constitution of August 11, 1919, authorizes the president to promulgate the necessary ordinances in case the Reichstag should reject the budget or in case it should be dissolved before it can vote. Thus on July 18, 1930, when the Reichstag was dissolved after having rejected the budgetary proposals of the government, fiscal ordinances were promulgated by the president of the Reich and the budget for 1930 was established by decree subject to a subsequent law.

Actually the German method of financial administration has not been successful in securing a balanced budget. All budgets since that for 1924 have resulted in deficits. The deficit of an ordinary budget must figure as an ordinary expenditure in the second budget thereafter, which means that new taxes are to be raised in order to cover the deficit. In reality the deficits have been covered by loans, especially short term foreign

loans; this has given rise to a floating debt which in August, 1930, exceeded the sum of 1,300,000,000 marks.

The minister of finance does not possess the power, as does the chancellor of the Exchequer in England, to control his colleagues when the budget is carried into practise; his position in this respect resembles that of the French minister of finance. He is not even authorized, as in France, to place comptrollers of expenditures beside each minister; the ministers have their own special officials who account for their expenditures. The system of the monthly distribution of funds is modeled after the French pattern. The minister of finance decides upon the total amount to be passed for payment, but no control guarantees that the limit is not exceeded; the only check consists in a refusal of the accountants to honor orders beyond the amount determined.

The minister of finance is in charge of the collection of most revenues. In the Ministry of Finance there exist departments and subdepartments which direct the assessment and collection of taxes and other revenues subject to his jurisdiction. The local treasuries forward the funds at their disposal to the central Treasury, either by depositing them with the Reichsbank to the account of the Reich or by postal checks. The amount due the Reich from its postal checking account is cleared through the Reichsbank. Certain treasuries are authorized to maintain an account with the Reichsbank. On the whole the part played by the Reichsbank in financial administration is inferior to that of the Bank of England or the Bank of France.

The minister of finance issues the public loans authorized by the Parliament and has charge of the conversion of debt. The administration of the national debt is reserved to an independent organ, the Reichsschuldenverwaltung. Up to 1924 the temporary deficits of the Treasury were covered by advances from the Reichsbank against unlimited Treasury certificates; but since that date the Reichsbank has been permitted to open credits for a maximum period of three months up to the amount of 100,000,000 marks, which must be entirely refunded not later than July 15 following the end of the financial year (March 31). Furthermore, the Reichsbank may discount Treasury certificates of three months' maturity up to the amount of 400,000,000 marks, providing the certificates bear the signature of a solvent person. The Treasury may also grant short term loans to the Railroad Administration and the

Post Office Department, both of which enjoy a large degree of financial autonomy.

The financial administration possesses no organ whatever to insure compliance with the laws and decisions promulgated by the Reichstag, but in every administrative branch a "special budget officer" or a "budget office" nominated by the minister or by the head of the respective department has charge of that function and works under the supervision of the minister at the head of the respective administrative branch. The Reichstag itself is not interested in the compliance with its decrees. Expenditures exceeding the budgetary credits are made without authorization from the Reichstag and at times are submitted for approval only after the financial statements have been published. Yet even in such cases the Reichstag has given its approval without comment.

Since May, 1929, the minister of finance has published a monthly account of receipts and expenditures as well as a Treasury report and a statement concerning the floating debt. With the assistance of other departments he also draws up the budgetary accounts of the Reich which are published and submitted to the Reichstag. The accounts rendered by the accountants are submitted to the autonomous Rechnungshof, which has power to investigate the proper execution of the budget, the compliance with the law, the proper handling of expenditures by the administration and finally whether unnecessary or excessive expenditures were incurred. This body has also the right to decide on the introduction of reforms and incorporates its observations in an annual report addressed to the government. After the accounts and the report of the Rechnungshof have been submitted to the Reichsrat and Reichstag these bodies pass resolutions by which they release the government from responsibility. Actually the Reichstag is not interested in exercising control.

The financial administration of the United States was very deficient up to the passing of the Budget and Accounting Act of 1921. The preparation of the appropriation bills was in the hands of the numerous committees of the House of Representatives and the Senate. There was no interest in balancing receipts and expenditures. The Treasury did not possess the legal power to examine the demands for expenditures of the various departments, to prevent the grant of expenditures recognized as unnecessary or to check the misuse of credits granted. Congress maintained that the appropriations were com-

pulsory for the government and by no means optional and that the government was compelled to spend the amount it had been granted. Logrolling, the pork barrel, inconsistency and waste were the outstanding characteristics of the management of the finances of the United States.

The legislation of 1921 reorganized the entire system of financial administration. Although the English system was accepted as a model it was not followed in every detail. It would have been impossible, for example, to give to the secretary of the Treasury the power possessed by the chancellor of the Exchequer in England. The forces which resisted any radical change were the preponderant position of the president, the subordinate position of the ministers as simple assistants to the president, the large measure of financial control granted to Congress by the constitution and finally the strength of a tradition more than a century old.

The task and responsibility of preparing, elaborating and presenting the annual budget are vested in the president. In this task he is assisted by the Bureau of the Budget, created by the law of 1921. The function of the Bureau corresponds to that of the permanent secretaries to the Treasury in England; its task is to coordinate, revise and increase the estimates of the various departments and services, a function which practically amounts to a control of the entire administration. The Board of Estimates, a division of the Bureau of the Budget, is charged especially with maintaining the connections with all branches of the federal administration. In every branch of service there is a special official, the budget officer, nominated by the head of the service, whose task it is to prepare the estimates and to deal with the Bureau of the Budget. The executive departments are compelled to supply the Bureau of the Budget with all the information which it desires and the director, assistant director and duly authorized employees of the Bureau have the right to examine the books of all departments and services.

Credits are granted to each department or service. The head of a department or service has the right to employ them without consulting the Bureau of the Budget, but no official or administrative branch may use them for a new purpose without consulting the Bureau of the Budget and receiving its approval. On the other hand, immediately upon the publication of the budget and before June 30 each service must inform the Bureau as to the "Apportionment of Appropriations"—the monthly, trimestrial or other appor-

tionment of its credits which it intends to make. Any subsequent change in the apportionment must also be reported to the Bureau and endorsed by it. Besides, every service must inform the Bureau at the end of each trimester of the amount actually spent during the period. The coordinating agencies, commissions of officials headed by the chief coordinator and supervised by the director of the Bureau of the Budget, serve the purpose of finding the most economical way of using the credits granted by Congress, of insuring the most rapid and most simple functioning of the federal service and of eliminating friction and delay.

Because of the preeminence of the president and the Bureau of the Budget the position of the secretary of the Treasury cannot be compared with that of the chancellor of the Exchequer or of the ministers of finance of France or Germany. The secretary of the Treasury proposes to the president the creation or the reduction of taxes, loans and other financial measures. He has complete supervision and control of the collection and preservation of public funds. The absence of a central bank in the United States formerly raised great problems in the matter of the custody of the funds. At first they were deposited in various banks, but favoritism on the part of Treasury officials and frequent bank failures led to their segregation in Treasury vaults. The economic waste and disturbing effects caused by the withdrawal of large sums of money from circulation brought about, however, a gradual return to the bank deposit system in the years following the Civil War. With the passing of the Federal Reserve Act in 1913 the Federal Reserve Banks were designated as fiscal agents and government depositories, although the secretary of the Treasury retained the right to select other banks as well. In 1920 a division on deposits was created and charged with all matters pertaining to the designation of depositories. The present policy is to maintain the national banks as depositories only in places which are remote from Federal Reserve Banks or their branches and in which a depository is necessary for pay roll purposes. In 1928 the secretary of the Treasury was authorized to designate state banks and trust companies to carry public deposits and act as fiscal agents of the government.

The Treasury is also charged with carrying on credit operations on behalf of the government. The short term borrowing is effected through the sale of Treasury certificates and Treasury notes issued usually in anticipation of revenue.

These operations help the Treasury in distributing the public expenditure more evenly and to that extent have a stabilizing effect on the economic life of the country.

The control and auditing of financial operations are vested in the General Accounting Office established by the law of 1921. It is under the supervision of the comptroller general of the United States and the assistant comptroller general, both of whom are nominated by the president for fifteen years subject to the approval of the Senate. They may be recalled only with the consent of both houses of Congress. The General Accounting Office is to a certain extent an agent of Congress; its function may be compared with that of the comptroller and auditor general of England. Since 1921 its power has been considerably increased. It prescribes the forms and methods of accounting which must be employed by every department and service, as well as the forms of the accounts and the methods for their examination; actually, it has introduced very important simplifications by making uniform the methods of accounting and recording. It has the right to demand information from any office and to examine on the spot every ledger and document. It investigates whether expenditures and collections are effected in conformity with the law and the will of Congress. Similarly, upon the request of the services and particularly the paymasters it interprets the provisions of the laws governing the budget and decides whether a certain credit may be employed for a certain purpose. Congress alone possesses authority to change its interpretations. In spite of its extensive jurisdiction it does not exercise the same power as a comptroller of expenditure in France. Its control extends only to the orders issued by the chiefs of the various services previous to the actual making of payments, but even this sort of control is not general. The General Accounting Office forwards to the president of the United States and to Congress reports in which it proposes measures intended to render the working of the federal services more simple and economical. Both houses and their committees as well as the Bureau of the Budget frequently ask the Office to investigate certain problems and to report on its findings. If the Office discovers that certain expenditures or the terms of a contract infringe upon the law, it is its duty to notify Congress of this fact through a special report.

In addition to these functions the General Accounting Office exercises various competencies in the interest of which it is divided into several

sections. The Claims Division investigates private claims, based on administrative acts, which the services are unable to satisfy because of the lack of credit. If the General Accounting Office considers the claims justified, it makes recommendations in their favor to Congress. The Audit Division is in charge of the examination and the auditing of the accounts of all departments including the Post Office Department. The Office of the General Counsel has the task of giving legal advice, especially on questions of interpretation of the budget regarding the appeal taken by a service against the decision of other sections of the General Accounting Office. The Records Division is in charge of the archives. i.e. the preservation of accounts, contracts, checks and other documents.

FINANCIAL ORGANIZATION. The most intricate and delicate structural component of modern economic society is its financial organization, consisting of its financial institutions, the arteries through which flows credit, the life blood of the entire economic structure. The characteristics of the financial organization of a country depend upon the degree of its economic development. The more minute the division of labor, the more intensive the growth of industry and trade, the greater the dependence upon foreign

countries as sources of raw materials or as markets for finished goods, the more complex is the financial organization and the greater its significance in the economic system of the country. In highly industrialized and commercialized countries such as the United States, Great Britain, Germany and Holland the financial organization is therefore much more intricate and sensitive than that in predominantly agricultural countries.

Financial organization in a modern sense is of recent origin. So long as the larger part of the population was engaged in agriculture, with trade only local in character, financial organization was unnecessary. As the local communities became less and less self-sufficient and trade transcended local boundaries the use of money as a medium of exchange and as a standard of value became more widespread. With it there developed the new business of money changers and later of money lenders, the progenitors of modern bankers. Yet neither these nor the financial centers which flourished in northern Italy, southern Germany and certain parts of France in the later Middle Ages could at this stage be regarded as constituting a financial organization. The incipient bankers were primarily merchants whose banking activities were merely incidental to their commercial transactions and had no firm foundation in the law. Furthermore, the numerous coins then in use did not represent money in the true sense of the term. Since each sovereign had complete power to change the metallic content of the currency in his own territory, the coin was merely a particle of metal, whose value fluctuated with its fine gold or silver content.

The growth of international trade coupled with the great uncertainty involved in shipping coin and bullion from one market to another led of necessity to the development of credit instruments such as bills of exchange. These credit instruments could become widely used only if they attained unquestioned legal standing and if the rights of the drawers, drawees and holders were properly safeguarded by legal provisions. When this was secured through the development and codification of the law merchant, credit instruments acquired an increased circulatory power. Thus were laid the foundations for a development of the modern financial organization.

In the course of time the functions of banking institutions widened in scope; at first merely the safekeepers of the funds of their customers—as were the goldsmiths in England and the *kassiers* in Holland—they soon became bankers in the

modern sense, operating more with their customers' funds than with their own. At the same time as enterprises became larger the funds supplied by individual capitalists, whether they assumed the guise of silent partners or of outside money lenders, became insufficient. A larger investing public had to be drawn upon and the development of negotiable shares became one of the first prerequisites to the establishment of larger enterprises. The appearance of negotiable securities made necessary the creation of a trading center to make them marketable and to give them a market value. These new trading centers, the stock exchanges, are the earliest visible expression of a financial organization. Here for the first time one may clearly discern the nucleus of a financial community.

The development of credit instruments, the creation of stock exchanges and the gradual evolution of legal protection paved the way for the next step, the shift from a money to a credit economy. This unheralded change soon profoundly affected the economic development of nations. It freed economic activity from concern over the availability of precious metals for use as money and substituted therefor the transfer of claims between buyer and seller, creditor and debtor, on the books of financial institutions. Moreover, as the drafts or bills of exchange of merchants or banks of an established reputation became the equivalent of money, there appeared the possibility of increasing the volume of purchasing power by expanding loans. The placing of bank credit on an equal footing with money and the further development of credit instruments created wealth of a new type. Whereas up to this time immovable property, chattels, goods, precious metals and ships had been regarded as the principal forms of wealth, the latter were now frequently represented by credit instruments and particularly securities, which in the more advanced countries such as Holland soon constituted a considerable portion of the total national wealth.

The growth of financial institutions and the increased use of credit instruments, notably stocks and bonds, now began to exert a decided influence on the disposal of wealth. The liquid resources of a large number of individuals could be concentrated in the hands of a few, who although not the owners had the power of free disposal over them. This concentration of control, which is in part the result of organization of large enterprises and in part the cause of their further expansion, has transformed finance from

a subordinate aid of commerce and industry into an important force dominating an ever increasing area of the economic field. In their aggregate, financial institutions regulate the rate of flow and the distribution of capital among various branches of production and through their representatives on the board of directors of the various industrial enterprises they exercise a direct influence on the economic life of nations. To a large extent they have taken the place of the entrepreneur in the promotion and organization of new enterprises; in many instances they appear as the actual managers of large manufacturing, transportation and mining enterprises.

In assessing the significance of the financial control of economic activities it must be borne in mind that the interests of the financial institutions and those of the owners of the funds with which they operate do not always coincide. The banks, particularly when privately owned, are chiefly interested in earning large profits and will at times dispose of the funds under their control without much concern over the effect on the welfare of the country or of the depositors. The overexpansion of security and real estate loans may be cited as cases in point. Furthermore, since financial institutions are usually under the control of one or a few individuals they generally favor the enterprises in which those individuals are interested, often to the exclusion of the interests of the depositors. While depositors often borrow from the banks, the majority of them are not the real beneficiaries of the funds accumulated therein. While there is not accurate information on the subject for every country, a banking inquiry made by the German government in 1930 revealed that much more than half the total of loans made by the large German banks were issued to large industrial and commercial enterprises whose deposits did not exceed 20 percent of the total deposits of the banks. In general one may state that where banking is concentrated in the hands of a few institutions large enterprises are favored at the expense of small, which often find it difficult to obtain credit accommodations at moderate rates.

The development of the financial organization of individual countries was not uniform. In some cases it grew up concomitantly with the industrial expansion of the country, in others it was imposed from the outside in order to stimulate industrial development. Thus in Great Britain, the United States and Holland the financial organization developed slowly and more or less in

adjustment to the economic status of the country. In pre-war Russia and Japan, on the other hand, the financial structure was erected under the tutelage of the government and prior to the achievement of requisite status by industry and trade. But whatever their historical antecedents financial institutions soon made their influence felt in the economic life of every country. This applies not only to the continent of Europe, where a close relationship between banking and industry has existed for a number of years and where corporations are spoken of as belonging to the sphere of this or that bank, but also in a steadily increasing degree to the United States. It may be safely stated that the power of financial institutions at present rivals that of sovereign states; in fact the former have at times dictated the financial policies of the latter. It is not uncommon for bankers before making a loan to a government to insist that certain fiscal measures be adopted or that a foreign receiver of revenue be appointed with powers wider than those of the government. The financial history of the Central American countries and of post-war Europe is replete with such examples.

Modern financial organization is generally divided into commercial and investment banking. This division, however, is to a large extent arbitrary because both types of banking are closely related and greatly overlap. The distinctions between the two systems lie mainly in the length of time and the purpose for which funds are made available and in the method of operation. Commercial banking is concerned primarily with receiving deposits and with granting short term loans—through discounting for their customers and lending to them or through purchasing acceptances and commercial paper in the open market—to finance goods in process of manufacture and in the various stages of distribution. In general the functions of commercial banking are to meet the seasonal credit needs of industry, trade and agriculture and to provide a mechanism for facilitating national as well as international payments. Another function, the legitimacy of which is questioned by the more orthodox opinion, is the financing of the stock market through granting of security loans to brokers and individuals. Investment banks, on the other hand, have as their main function the furnishing of long term capital for investment in fixed assets such as plant and equipment or to serve as permanent working capital. They also float long term obligations of governments and their political subdivisions. While commercial banks

operate chiefly with the funds of their depositors, to whom they stand in the relationship of debtor to creditor, investment houses in the proper sense of the term act merely as middlemen between investor and borrower without assuming any obligation to the buyers of the securities.

The principal types of institutions engaged in commercial banking are commercial banks and trust companies, acceptance and discount houses, commercial paper houses, finance companies, industrial loan companies and credit unions. Of these, commercial banks and trust companies are the most important and represent by far the largest part of the banking resources of a country. Through the development of the trust function, which is exercised in many countries by both commercial banks and trust companies, these institutions have brought immense wealth under their control; their influence is much greater than their balance sheets would indicate. Acceptance, discount and commercial paper houses are merely auxiliaries to commercial banks and concern themselves almost exclusively with open market transactions, such as the acceptance of the drafts and the buying and selling of acceptances and commercial paper. These specialized functions are also carried out by the large commercial banks through their various departments. As opposed to these three classes of financial institutions which finance the producer and distributor of commodities engaged in domestic or foreign trade, finance companies, industrial loan companies and credit unions operate primarily as financial agencies for the consumer or small scale business.

On the continent of Europe the same institution ordinarily engages in both investment and commercial banking, but in the English speaking countries the two types of financial activity are nominally carried on by separate agencies. In the United States, however, the functional distinction is gradually disappearing; commercial banks are establishing security affiliates and bond departments, and large investment houses are gaining control over commercial banks. Investment banking comprises the following institutions: private investment houses, investment security affiliates of commercial banks, mortgage banks, savings banks, investment trusts and the institutions centering around the stock exchange, such as stock brokerage houses. Of these the private investment houses and the security affiliates are the most important because they take a leading part in floating a majority of the capital issues of the country. If their policies are prop-

erly coordinated they are able to exert a considerable influence on the flow of capital into the various channels. The savings banks must be classified as belonging to the investment banking group, for they invest their deposits in bonds or real estate mortgages, thereby directly or indirectly furnishing long term capital to industry, agriculture and political units. Yet unlike the investment house and the security affiliate, which act merely as middlemen between the borrower and the investor without guaranteeing the payment of principal and interest, the savings bank stands in a debtor and creditor relationship to its depositors. The mortgage bank although it represents the oldest form of investment banking is still further removed from the pure investment banking type. Having for its purpose either the financing of the long term needs of agriculture or the furnishing of loans secured by urban real estate, it lends money to individuals on mortgages and on the basis of these issues its own bonds, thus providing the link through which the mortgage credit of the individual is tied up with the capital market. Most countries have established agricultural mortgage banks which operate under special charters, very often with government funds or with government guaranty of their obligations.

The division of financial institutions into commercial and investment banking has led to the development of two separate markets, the short term money market and the long term capital market, although here too the distinction is more theoretical than practical. The capital market is the central meeting place of the demand and supply of long term capital. It embraces the activities of the various types of buyers and sellers of securities and effects the distribution of shares and bonds. The function of the capital market is to assist in the transformation of fixed assets which cannot as a rule be readily appraised nor easily marketed into securities which are not only easily appraised but can be converted into cash practically at a moment's notice. The capital market may be divided into two separate parts: the original distribution market, which embraces the issuance and distribution of new securities, and the secondary distribution market, which deals with the buying and selling of securities already issued and outstanding. The latter market is largely represented by the various stock exchanges. Whether the exchange functions under strict supervision by the government, as in France, or is organized as a more or less independent private association, as in the

United States, trading on the exchange is closely regulated and the number of traders is limited. Although stock exchanges have often been accused of fostering speculation they perform an important function in modern financial organization as the principal media for the trading of securities and the greatest factor in their marketability.

The money market plays a most important role in the modern financial organization of society. It functions as the equilibrator of the entire system, for it is the central meeting place of the demand and the supply of short term funds. On it the financial institutions dispose of their liquid funds or increase their cash reserves through the calling of loans, the selling of bills and short term government notes or, as is the case in central Europe, by obtaining day to day loans. The rates of interest on the open market move in harmony and have a decided influence on the rates charged to individual borrowers. The large money markets, notably New York and London, attract the surplus funds of the world because of the ease with which they can employ large volumes of short term funds and because of the high financial standing of their banking institutions. Balances kept in these centers and bills of exchange drawn on their large financial institutions represent a substantial part of the reserves of a number of countries on the gold and gold-exchange standards. The fact that London and New York are the bankers of the world places an added responsibility upon the agencies operating in these markets, particularly upon the respective central banks; their policies exercise an international influence. For this reason they are also more susceptible to world conditions; London in particular, which has always operated on a narrow gold margin, is exposed to grave dangers whenever a withdrawal of foreign funds takes place on a large scale.

The money market is divided into a number of individual markets, the most important of which are the call money market, the acceptance market, the commercial paper market, the market for short term government notes and bills and the foreign exchange market. Yet the mechanism and structure of money markets display considerable differences, since each is an outgrowth of the industrial and commercial development of the economic unit which it serves. In New York, for example, due to the preponderant influence of the stock market and the daily settlement of securities the call money market is by far the most important; in London, which for

over a century has financed the world's international trade, the acceptance market leads; while in Amsterdam the one-month loan *prolongatie* is most important. For this reason most of the liquid funds in London flow into the acceptance market, while in New York they are in normal times absorbed by the call market. Aside from the fact that this is partly responsible for the different relationship between the banks and the central banks, it has also an important economic bearing. In New York a large inflow of gold from abroad and easy money conditions lead in the long run to an increased absorption of funds for security transactions, while in London they lead to a lowering of the bill rate, which in turn makes cheaper the financing of international trade.

The activities of the various financial institutions on the money market as well as of the market itself are considerably influenced by the central banks. Despite differences in origin, historical development and legal framework central banks perform today more or less the same functions in every country. They are the custodians of the metallic reserve, they have in most countries the sole privilege of issuing notes, they are the fiscal agents of the government and it is their duty to regulate the volume of currency and credit. If before the World War the policies of central banks were conditioned chiefly by the stability of foreign exchange rates, in post-war years they have been determined to an increasing degree by the movement of prices of commodities and of securities as an indication of the state of industry and trade. While it is still a debated question to what extent central bank policy is able to influence business conditions, it is generally conceded that the central bank is an important factor in the money market and that through its discount and open market policy and through credit rationing it can exercise a powerful influence on the cost of money which in the long run does not fail to affect business. Central banks, particularly in the post-war period, have been looked upon as the nerve center and regulator of the credit structure of the various countries; and, in fact, their policies have exercised great influence over business conditions and at times have had tremendous social consequences. The currency and credit inflation pursued by most continental European countries in 1919-24 with the resulting pauperization of the middle class in these countries forms one of the most striking examples of the effects of a faulty central bank policy.

The great power wielded by the central banks and the strong influence exercised by them not only over the money market but also over the entire economic life of the country have induced most countries to regulate closely their activities and in many instances to direct their management. Whether the central bank is owned by the government, by member banks or by private stockholders, the governments have in practically all cases, with the notable exception of England, the right to appoint the governor of the bank and exercise control over its management. Even in England, although officially no connection exists between the Treasury and the Bank of England, it is well known that they co-operate very closely in all matters affecting the financial policy of Great Britain.

The regulative power of the government is not restricted to central banks but in a number of countries extends also to the commercial banks. Control is exercised through special bank laws regulating the chartering, organization and operation of banks and through government bureaus whose duty it is to examine the banks as to their solvency and their possible infringement upon the bank laws. Although direct government regulation concerns itself only with technical aspects of banking, in post-war years central banks have endeavored to influence also the distribution and use of bank credit.

European countries have for a long time been reluctant to establish government supervision over banks and in some countries the latter still operate as ordinary corporations. But the banking difficulties which set in after the war, the large number of bank failures with disastrous results to the entire national economy and the growing realization of the tremendous influence exercised by financial institutions have convinced many governments that banks are more than ordinary corporations and that government supervision is essential. The Scandinavian countries and Japan offer noteworthy examples of banking crises resulting in bank laws and rigid government regulations. The banking crisis in Germany during the summer of 1931 has not only strengthened the tendency to supervise the operation of banks but has resulted in the addition of two of the largest financial institutions of the country to the list of banks under direct or indirect government control. At the same time the growing concentration of private control over banking through mergers, the organization of chain and group banks and similar devices, both in Europe where branch banking has reached a

high degree of development and in the United States where nation wide branch banking is prohibited, has given an added impetus to the movement for strict government supervision. In fact proposals for the nationalization of banking have received serious attention in many quarters.

In contrast with commercial banking investment banking in almost all countries is carried on without any government supervision. Although the listing requirements of the stock exchanges, blue sky laws and similar enactments have endeavored to impose some control over the issue of securities and have removed some of the abuses, neither the interests of the investor nor of society are really safeguarded. Except during war periods governments have restricted themselves to the regulation of the flow of capital from and to other countries. Chiefly for political reasons embargoes on foreign loans, the requirement of government permission to list foreign securities on the stock exchanges and the exertion of direct pressure by the government have been used and are still being used with varied success by lending countries. In post-war years a number of borrowing countries have also endeavored to regulate the inflow of foreign capital either through special boards or by insisting that all foreign loans must be sanctioned by the minister of finance. So far, however, no capitalistic government has attempted to regulate the domestic flow of capital in normal times. This lack of interest is surprising in view of the fact that the influence exercised by the investment banks over the economic activities of a country is in many respects much greater than that of the commercial banks. Investment banks regulate the flow of long term capital and thus determine the channels into which it shall go. Since capital is the prime mover in any enterprise the careful direction of capital into industries where it is most needed and the cessation of the flow of capital to industries which are overbuilt would be one of the most effective means of eliminating business cycles. Furthermore, investment bankers determine to a considerable extent the type and quality of security in which investors place their savings, for most private investors are unable to judge security values accurately and rely on the advice of investment bankers or security dealers. In any system of planned economy, however little developed, the regulation of the flow of long term capital would be undertaken as one of the first steps. In Soviet Russia, for example, the distribution of long term capital is regulated and

planned in the same manner as the output of industry or foreign trade.

Capital is international in character and flows to centers where it can bring the highest return, provided the risk involved is not too great. Financial institutions, the channels through which capital and credit flow, have therefore for many decades been internationally oriented. This was accomplished through the establishment of branches and overseas banks in foreign countries, the creation of affiliates or the maintenance of special representatives and correspondence relationships. Irrespective of the motive for which these overseas connections were created and which caused the movement of capital from one country to another, the internationalization of financial organization had wide economic, social and political effects. It greatly facilitated the international interchange of commodities, it opened up the natural resources of undeveloped countries, thereby greatly affecting the social and economic habits of large groups of people who had hitherto remained unaffected by the blessings of the machine age, and it played an important role in the development of the policy of imperialism.

The close connection between the various leading financial centers has led to the development of the international money market, which links these centers together and through which a community of interest among them has been established. The international money market, however, embraces only those countries whose currencies are definitely linked up with gold, which have well organized banking systems and which are not handicapped by any foreign exchange restrictions. This market is not only the seat of settlement of all international financial transactions but through it is regulated the flow of funds to centers where the highest return can be secured. Thus the international money market levels out the volume of short term funds available in the various financial centers, brings about an equalization of interest rates and is an effective agent in maintaining the stability of the various exchanges. Under stable economic and political conditions the international money market has worked well. In post-war years, however, due to the abnormal economic and political situation and to the measures adopted by some of the leading central banks, notably the Federal Reserve system and the Bank of France, to offset the inflow of gold, the international money market has lost to a large extent its power of leveling out interest rates and of regulating the interna-

ional flow of funds and gold. Because of this and the great problems confronting the international money market, such as reparations, war debts, maldistribution of gold and the like, efforts were made to establish a concrete connection among the various central banks; this was effected through the creation of the Bank for International Settlements in 1929. While the powers of this institution are greatly limited since it cannot operate in any money market without the prior consent of the corresponding central bank, it has proved to be of real assistance to weaker central banks when the stability of their currencies was endangered.

Although the term international capital market is often used, its operations are in fact closely interwoven with those of the international money market. The term international capital market, however, is justly applied to certain individual centers such as London and New York, because through them a large part of the long term capital needs of the world is met. Transactions usually carried out on this market are the flotation of loans through international syndicates and arbitrage on securities listed on various exchanges. While the economic and political importance of foreign loans has led to government supervision and control in some countries, nothing has so far been done to provide a machinery for the regulation of the international flow of capital. This is left entirely to the initiative of a few large investment houses. While it has worked out more or less satisfactorily, there have grown out of it a number of defects and malpractices, such as overborrowing, creation of uneconomic public works and overexpansion of certain industries, which affect adversely not only the investors but also the borrowing countries. Furthermore, the international flow of capital usually breaks down almost completely at the time when it is most needed. At present there is therefore a movement afoot to establish under the auspices of the League of Nations an institution similar to the Bank for International Settlements, the duty of which would be to coordinate and supplement the international flow of long term capital.

FINANCIAL STATEMENTS by business concerns include balance sheets and profit and loss statements. Balance sheets or property statements are the accounting reflections of conditions found to exist in the dollar facts of business operation. They consist of a listing of values owned or owed by the subject, totaled by related groups. The owned values or assets consist in general of cash; notes or accounts receivable; merchandise in either a raw, a semifinished or a finished state; investments reflecting the ownership of securities; real estate, buildings, machinery and fixtures; and prepaid expense items for which the subject will receive services and the like. The owed values or liabilities consist primarily of notes or accounts payable; amounts due or estimated to be due in the payment of taxes; claims for moneys that may have been deposited with the subject; debts for machinery, real estate and buildings not due immediately. The excess of assets over liabilities is the net worth or owned capital of the subject. The net worth may be listed under this caption or it may be made up of capital, surplus and undivided profits. Another item may appear on the liability side of the statement, usually between the subtotal of the outside liabilities and the net worth, under the caption of "reserves." To be true reserves such items should represent sums set aside from net worth to take care of declines in value of any asset items.

Although frequently considered as a separate and distinct report the profit and loss statement is closely connected with the property statement. The two should not be separated as this often destroys the value of one or both. Management scanning the record of its past performance to detect errors in policy or execution or the banker analyzing financial statements to protect himself against an overextension of credit and to secure a basis of advice to the customer with a view to insuring the soundness of his business should combine the comparison of a series of balance sheet items, reflecting the condition at the end of a number of successive periods, with a study of the profit and loss statements for the same periods. While the property statements show changes in assets, liabilities and net worth items, the profit and loss statements indicating the gross and net profit yields of the various lines of business carried on by the subject explain how and why these changes occurred.

The practise of submitting financial statements to the bank together with application for a loan became established long before statement

analysis, as it is now understood, became prevalent. The early statements were frequently fragmentary memoranda lacking a great deal in accuracy and suggestive rather than convincing. They were read by loan officers and filed, perhaps with a penciled memorandum or two on their container.

The system of formal and recorded analysis of statements took form in the decade between 1895 and 1905. It was of slow growth and of great unevenness—here a record kept, there a mental reservation made. As business began to be nationalized and the contact between borrower and bank became less closely personal, a need developed for something more detailed and permanent in analysis. This led to the columnar comparison sheet on which the banker transcribed the memoranda of the statement under a more formal and regular nomenclature. The use of such comparison forms has been continued, although a great variety of styles has developed. Their chief advantage is that within any single bank they standardize comparison; their disadvantage is that they may overemphasize mere size and minimize the importance of proportion.

Shortly after the adoption of the comparison form a growing appreciation of the importance of proportion in or between statement items became evident. Analysts began to speak of "quick" and "current" assets and liabilities, funded or mortgage debts, fixed assets and the like. These phrases cover detailed segregation of assets or liabilities massed in totals for comparison. A confusion still remains in the use of the two terms quick and current as applied to assets. Frequently they are used as meaning the same thing and again as having distinctly different meanings. Quick assets are such values as may be turned into cash by immediate sale. It is obvious that in many instances an item may be both quick and current. A current asset is such an asset as will change into cash in the ordinary course of business. For example, raw material becomes merchandise in process or partly fabricated, then finished goods and later receivables; as these are collected they become cash with which current indebtedness may be paid.

At first analysts were content to compare the dollar amounts of current assets and liabilities, establish the fact of an asset margin and gauge the safety factor by this margin. But it was soon discovered that the relation rather than the difference between current assets and liabilities was the significant factor. From this point analysis acknowledged the importance of pro-

portion. The first such proportion to be adopted was the current ratio, derived by dividing the current assets by the current liabilities. It may well be said that this acknowledgment marked an epoch in analysis. But current ratio rating for credit strength brought upon its worshipers a host of dangers. One such danger was that a ratio of two to one was accepted as indicating satisfactory strength and no allowance was made for economic or trade variation. A second and greater danger lay in the tacit reliance on this one proportion, which could easily be window dressed; there was no general appreciation that other proportions or ratios might have almost as great indicative values. The significance of these other proportions has received tardy and as yet incomplete recognition, too many analysts treating them as general impressions rather than as facts susceptible of recording and comparison.

"Top heavy with debt" is an example of such an unrecordable stigma against credit strength. When the net worth is too small in its relation to debt, then the top heavy condition prevails. A ratio developed between net worth and debt, by dividing the first by the second, will produce a recordable figure. This will move up or down as the capital structure condition improves or weakens. A reading of these movements eliminates the misplaced confidence arising from an apparently small dollar figure for debt or the apprehension caused by an apparently large figure for debt. This ratio expresses capital structure strength in figures that can be compared year by year or as between two similar companies or as between any company and the average for the trade. It substitutes accuracy for impression and its use strengthens analysis.

Analysts used to rely on their intuitive belief in the merchandising capacity, tinged by sales volume only. Now sales volume as such may be a poor index of strength or weakness in merchandising capacity. There is a definite connection between sales and inventories, because merchandise is purchased or fabricated so that it may be sold. The merchant who can achieve sales of \$600 for each unit of \$100 of inventory is a better merchant than one who can develop only \$400 of sales on the same inventory, for he is able to balance his inventory more closely to current demand. A ratio as between sales and inventory reduced to a recordable percentage figure is much superior as a measure of merchandising to general impressions based on subjective judgments.

The figures for fixed assets, which generally

represent manufacturing and distributive equipment, form a component part of two significant ratios. By and large such equipment must be paid for in funds representing the owners' investment in the business. In some cases long time borrowed capital, or funded debt, is the source of purchase money for such assets; but this is sound only when resale value remains at all times sufficient to repay such loans. Therefore, the proportion between net worth and fixed assets is a recordable and comparable fact, measuring the reasonableness of fixed investment. Similarly any investment in fixed assets must be justified by a reasonable productivity on sales. The proportion between sales and fixed assets provides a definite figure by which this productivity can be measured and compared year by year or for several companies.

The absolute figure for sales, or the volume of business, is a measure of activity which may be worth while to the subject or simply an overtrading fever. It becomes more significant when related to profits. The ratio of net profits to sales is an illuminating measure of the effectiveness of sales. If this ratio is too low while volume is high, then a company is doing business simply for the joy of doing it. The ratio of sales to net worth is a related measure of the effectiveness with which owned capital is being used. The effectiveness of sales is reflected to some extent also in the figure for receivables, because it represents the still uncollected sediment of sales. But the amount in dollars is not as significant as is the relation of sales to this item. If this ratio is too small, then poor collecting or too great liberality in sales terms are indicated.

No set figure for any of these ratios can be a safe standard of strength, because each type of business is subject to different trading, fabricating, marketing and economic strains. These trade strains tend to produce differing relations in the component factors of any ratio. Yet it has been found possible to study a large group of statements within single trades and to evolve ratios that are sufficiently typical to offer a general criterion by which to estimate the relative soundness of a single company. This is different from the process of ordinary analysis only in that it uses as the standard of comparison a set of trade averages rather than the vague and unformulated notions of the analyst.

Analysis of Financial Statements (New York 1928); Bliss, James H., *Financial and Operating Ratios in Management* (New York 1923).

FINES. The fine is a pecuniary penalty paid to a public authority for the violation of a criminal law. In Roman law the term *multa* designated a public fine. In modern French law it is called *amende* and in modern German law *Geldstrafe*. The fine is usually distinguished from the penalty which is collectible by civil action for the benefit of a private party or by administrative order for the benefit of the state, and also from the primitive composition which went to the injured party or his kin. The modern fine is believed to have developed from the court fine, or peace money, of the system of composition, but it is not always clear that such sums were paid because of the breach of the public peace. The fine did not so much develop from the wite as replace it. Among the earliest public fines were the fines of judicial procedure so common in mediaeval French and English law. Because of its importance as revenue the modern fining system everywhere grew with the expansion of royal power. It was in effect a relaxation of the system of total confiscation. The king must have more than compensated himself for the loss in the forfeitures by the frequency of the fines; the former, moreover, often went not to him but to the lords; the subject preferred the lesser of two evils.

The early English amercement which replaced the forfeitures of Edward the Confessor illustrates this evolution. It came to be imposed for many minor offenses which caused the property but not the liberty of an offender to fall into mercy. In mediaeval England amercements were levied frequently, especially for missteps or defaults of procedure. The severity of the practise was mitigated by the fact that the amercement was enforceable by distress only. Moreover, the amercement had to be assessed by a jury of the offender's neighbors, a privilege which was preserved by Magna Carta, with the result that the king began to evade its provisions by resorting to fines.

The very term fine has an interesting history in the common law. In cases less than felony an offender was liable to imprisonment until he "made fine," or ended his imprisonment by paying an amount fixed not by any jury but by the judges. As Fox, who had delved thoroughly into the subject, put it, "the form of the judgment was not that the offender be imprisoned,

simply, nor that he be fined but that he be imprisoned for his fine . . . *capiatur pro fine*," or again, "It is not the Court that fines, but the offender." The active verb to fine dates from the sixteenth century. The power both to fine and imprison is now wrongly assumed to have existed at common law in cases of misdemeanors. The confusion arose because of the influence of the practise with respect to statutory fines, because the Star Chamber imposed fine and imprisonment, a practise which later was taken over by the King's Bench, and finally because the distinction between fines and amercements had fallen into obscurity.

The modern fining system, while it reveals some historical vestiges, has everywhere been of statutory formation. It took shape in the criminal codes and legislation of the era of Enlightenment. The ancient and mediaeval alternatives to the non-payment of a fine or a composition had usually been such harsh ones as slavery, loss of civil rights, banishment or corporal punishments. The predominant characteristic of the modern fining system became the commutation of unpaid fines into substituted terms of imprisonment of definite duration, calculated under a schedule establishing a ratio of days to the monetary value of the fine. Indeed, the development of the public fine coincided generally with the gradual introduction of imprisonment as a penalty in contradistinction to its earlier use as a means of preventive or subsidiary detention. While after the thirteenth century the first general use of imprisonment to compel the payment of pecuniary penalties was generally indefinite imprisonment, it was provided in some early laws of the Netherlands that a part of the penalty should be canceled by each day's imprisonment. Short terms of definite duration first appear in the Germanic countries in some north German town laws of the fourteenth century, as in Lübeck and Hamburg. The famous and very influential penal code of the empire, the *Carolina*, which still allowed half of a thief's penalty to go to the injured party, nevertheless limited the duration of imprisonment if penalties were not paid, for it was provided that imprisonment should last only *etliche zeit lange*. In at least one modern code, the French *Code pénal*, is contained a compromise with the older law in the institution of the *contrainte par corps*. The substituted imprisonment is limited to a definite term but it does not constitute a discharge of the fine, which may be subsequently collected from the offender if he comes into means. The

use of distress as a preliminary to imprisonment is now provided in most codes.

The assessment of the amount of fines within general maximums and minimums for specific offenses as well as for various classes of offenses, with discretion in the judges within the limits imposed, became another very marked feature of the fining system. One of the first continental provisions of this character was contained in the Prussian *Allgemeines Landrecht* of 1794. The provisions of maximums and minimums bespeak the general background of arbitrariness in the assessment of public fines, which, unlike the fixed tariffs of the system of composition, tended to be too large. Limitations upon the length of imprisonment in case of non-payment did not in themselves affect the severity of the fine. Provisions that the fine itself should be reasonable, i.e. proportioned to fault, had never been very effective. The provision of the English Bill of Rights against unreasonable fines has been copied in the American federal constitution and very widely in the American state constitutions, but in view of the all but universal statutory maximums and minimums these provisions may be regarded as largely anachronistic. Curiously, in some codes minimums without maximums are sometimes found.

The acceptance of the penalty of imprisonment first relegated the fine to a comparatively minor role as a punishment for slight misdemeanors and police offenses. In ancient and mediaeval times pecuniary penalties often had to be discharged in highly valuable domestic animals or agricultural goods; a money economy now made it particularly easy to measure and secure the fair price of an offense, but for that very reason it must have been felt that the deterrent value of such a punishment as the fine was bound to be small. Toward the latter half of the nineteenth century, however, the fine slowly gained in importance as a penal method. It came to be increasingly prescribed not only in serious misdemeanors but even in major crimes as a supplementary penalty. Such criminologists as Garofalo, Liszt, Wach, Rosenfeld, Wahlberg, Schmölder and others argued for its extension. There has generally been a great deal more preoccupation with the problem of the fine in continental countries than in England and the United States because judges in the former have not had very great discretion in imposing sentence. Among continental countries legislation since the World War has been most abundant in Germany, which from 1921 to 1924

accomplished important reforms in its fining system in accordance with the democratic spirit of the post-war German constitution.

The growing favor of the fine in recent decades may be ascribed largely to the realization of the great evils of short term imprisonment, which often results in converting casual offenders into confirmed criminals. Apart from the effect of prison conditions, the withdrawal of a worker from his livelihood frequently proves disastrous to him and his family under the competitive pressure of modern industrial organization. The social stigma that usually attaches to even a day's imprisonment also has its evil effect. The problem of avoiding short term imprisonment has received especially great attention in Germany, despite the fact that fines already were imposed in about fifty percent of all cases under the *Reichsstrafgesetzbuch* and supplementary criminal laws. The law of December 21, 1921, limiting short term imprisonments had the effect of almost cutting them in half in the same class of cases.

The problem of short term imprisonment, however, cannot be completely solved by the fine. Since imprisonment is the ordinary substitute for the unpaid fine, short term imprisonment may again result—a dilemma that works especially to the detriment of poor offenders. To avoid it some of the German codes of the era of Enlightenment provided curiously that the poor were not to be fined at all. In some countries, such as Italy, Norway and Mexico, the expedient has been tried of allowing fines to be earned by labor on public works, and a few American states in the south have even had laws providing that an offender might be put to work for a surety who would pay his fine, a practise that resulted in the involuntary servitude of many Negroes but has been declared unconstitutional by the United States Supreme Court. The prevailing remedy in recent times has been to permit the payment of fines in instalments. In England and the United States it is a common provision under the system of probation, and it is also permitted in many European countries.

The objection to the payment of fines upon the instalment plan lies in its tendency to undermine the deterrent value of the fine, which is never very great. While, however, fines certainly are not deterrent to the rich, the mere fact that they are pecuniary penalties must make them very impressive to the poor. Where professional criminals are concerned the fine presents one

of its most acute dilemmas. It has a tendency to lead to repetitions of criminal activity arising from efforts to balance the loss represented by the fine, a tendency most marked in crimes against morality, such as prostitution. In habitual crimes such as drunkenness the fine is also ineffective as a deterrent. Despite the fact that the fine is not much of a deterrent in the case of purely technical offenses such as traffic violations, it is not objectionable since it thus amounts to hardly more than a privilege tax. The fine in the nature of things can be the only possible penalty in countries where the criminal capacity of artificial persons is recognized, as in England and the United States. In the latter country at least one sensational fine of \$29,240,000 was imposed, on the Standard Oil Company of Indiana under the Elkins Act in 1907, although the decision was later reversed.

The fine as a mode of restitution for those injured by crime has been urged by the Italian positivists, especially Garofalo. They argue in effect for a reversion to some of the elements of the system of composition. Two fines are to be imposed, particularly in crimes of cupidity: one to go into the state's treasury and the other to the victim of the crime, the defaulting offender to be kept in prison until he has discharged his indebtedness through his labor. While the civil remedy of damages is often a failure even in the continental countries, which already permit the injured party to demand reparation in the criminal prosecution, the positivist proposal seems extreme. The discretionary power to order restitution as a condition of probation should suffice. A supplementary proposal of the positivists to concentrate all fines in a special state fund for the compensation of the victims of crime seems much more feasible.

At present practise with regard to the disposition of fines varies considerably. In their early history, where they did not go to the crown they went most frequently to the court as *fructus jurisdictionis*. They now generally inure to the benefit of the central government or one of its subdivisions. In Germany fines ordinarily go into the national or state treasury depending upon whether national or state courts impose them in the first instance. In France fines go into the national treasury in case of *crimes*, are divided in the case of *délits* between the national treasury, which gets twenty percent of the fine, and the department treasury, which gets eighty percent, and go to the commune in which the offense was committed in the case of *contra-*

ventions. A French peculiarity is the *décime*, a tax levied by the central government upon fines, which has been increased since the war. In England fines go into the Consolidated Fund and form part of the national revenue except in the case of summary offenses, when they inure to the Police Pension Fund. In American states fines frequently go to county and city as well as to state governments and also into special funds, determined usually by the character of the incurred violation; for instance, fines for violating the game laws may go into the state conservation fund.

The fine as a source of revenue has become of little importance to modern governments. Fines have rarely exceeded one half of one percent of the total revenue of the state and federal governments in the United States, where they are certainly imposed at least as frequently as in other countries. The percentages generally are higher for the city governments, probably because of the prominence of traffic fines. Indeed, in the smaller municipalities the authorities must often be tempted to equip a few more motor cycle traffic officers in preference to raising the tax rate a point or two.

Since the fine is a money penalty, it has at all times been subject to depreciation. In mediaeval times depreciation made the persisting harsh penalties of the old law relatively mild, so that their express abolition became unnecessary. In modern times, however, with fines generally low, legislation either increasing the amount of fines or establishing a new basis of payment has been more commonly necessary. The latter adjustment became imperative in Germany after the World War.

FINK, ALBERT (1827-97), American railroad manager and publicist. Fink was trained in Germany as a civil engineer, emigrated to the United States and acquired recognition as an early designer and builder of iron bridges. As general manager and vice president of the Louisville and Nashville Railroad from 1865 to 1875 he analyzed railway costs and rates, laying the basis for the classification of fixed and variable ex-

penditures and demonstrating the competitive origin of rate discriminations. His annual reports, one of which was reprinted in pamphlet form under the title *Cost of Railroad Transportation, Railroad Accounts, and Governmental Regulation of Railroads*, constituted an early and important contribution to the science of railway economics.

In 1875 Fink aided in organizing the Southern Railway and Steamship Association and became its general commissioner. This association of twenty-five competitive railways was one of the first successful pooling organizations in the United States. Two years later he was made head of a similar association among the four trunk line roads centering in New York City, formed to end a disastrous rate war. Fink's chief influence on railway affairs was exerted during the twelve years that he served as commissioner of the Trunk Line Association; his methods of organization and administration were followed by pooling and traffic associations throughout the country.

Fink was a strong advocate of voluntary association of railways as a defense against rate wars and unnecessary rate discriminations. He hoped to secure for railway pooling the legal authorization required for its effectiveness and opposed the legislative control of rate schedules. The program aroused opposition as tending to increase the arbitrary power of the railways. His reports as commissioner and the evidence he gave on numerous occasions before legislative committees, much of which circulated widely in pamphlet form, had an important educative effect, while his personal influence was instrumental in maintaining the precarious railway "peace" of the eighties and in developing the technique of railway cooperation. This cooperation was later realized through government regulation and the formation of a few great systems under centralized financial control.

FINLAY, GEORGE (1799-1875), English historian. Finlay was a philhellene who was profoundly impressed by the struggle of the Greeks for their independence and was convinced that after obtaining independence the Greek kingdom would enter a period of peaceful progress. Finlay went to Greece in 1823 and lived there for most of the remaining years of his life. He became absorbed in the history of

Greece and published numerous studies, which were later collected and edited by H. F. Tozer as *A History of Greece from Its Conquest by the Romans to the Present Time* (7 vols., Oxford 1877). The importance of this work rests on the fact that it turned the attention of English scholars toward the hitherto neglected and unpopular study of the history of the Byzantine Empire and of mediaeval Greece. Finlay was more a student of law and economics than of history, and his work reveals a greater emphasis on social and economic problems in the internal history of the Byzantine Empire. He emphasized the importance of the imperial laws to protect the poorer class of land proprietors from the encroachments of their wealthier neighbors; the significance of the middle class, which provided the emperors with money; and the importance of the Byzantine commerce with Genoa and Venice. He does, however, overestimate the importance of the reforms of Leo III (717-41), whom he considers the initiator of a mighty social revolution.

FINLEY, ROBERT (1772-1817), American educator and social worker. Finley held a Presbyterian pastorate at Basking Ridge, New Jersey, until he became president of the University of Georgia in 1817. In the early part of his career he taught school at Charleston, South Carolina, where his observations of slavery made a profound impression upon him. He never advocated emancipation, feeling that neither northern nor southern public opinion would support such a drastic proposal. He sought some way of relieving the country of the sometimes scorned and sometimes pitied free Negroes and, at the same time, of bringing about gradual and peaceful manumission. As a class, the free blacks were not wholly free; in the north their poverty caused them to be looked upon as public burdens, and in the south they were feared as a constant threat to the institution of slavery. In his *Thoughts on the Colonization of Free Blacks* (published anonymously, Washington 1816) Finley proposed the formation of colonies for

free Negroes on the African coast, a plan which had been discussed by the Virginia legislature as early as 1777. Finley's efforts, in conjunction with those of his brother-in-law, Elias B. Caldwell, led to the founding of the American Colonization Society in Washington in 1816.

FINOT, JEAN (Jean Finckelhaus) (1856-1922), French publicist. Finot was born in Poland. After studying at the University of Warsaw he became a naturalized citizen of France in 1897 and changed his name. He was editor of the *Cri de Paris* and later of a journal known successively as the *Revue des revues*, the *Revue* and the *Revue mondiale*. His persistent themes were the equality of races and of sexes, Franco-British solidarity and the quest for happiness. After 1914 he wrote with evident patriotic sentiment on war policies, war finances and European and world peace. He was unusually erudite and wrote trenchant and effective criticism of widely accepted doctrines, but his optimistic temperament and emotional intensity led him into frequent exaggeration and ill-supported generalization.

His most influential work was *Le préjugé des races*, which, translated into many languages like most of his other works, made him popular with darker skinned peoples everywhere and with race egalitarians in Europe and America. In this work he successfully combated many of the favorite contentions of the Gobineau-Chamberlain school of Teutonic racialists and of the related anthroposociologists. He showed that opinions as to the psychological traits of the great historical races were almost entirely subjective and deeply affected by social tradition and that the social milieu exerts a powerful influence on the mental traits of a race. He exaggerated the plasticity of human mental and physical traits under geographical and cultural influences and even explained the increasing brachycephalization of western Europe on the ground that a complex culture enlarges and broadens the brain. Believing in the future unity of all mankind he favored the crossing of races and argued that the diffusion of culture reduces racial differences.

FIORE, PASQUALE (1837-1914), Italian jurist. Fiore was a professor of law at various Italian universities from 1863 until his death. He served as legal adviser to the Italian government and as counsel in many important international cases, and he took an active part in the constructive work of the Institute of International Law.

His published works, notably *Il diritto internazionale codificato e la sua sanzione giuridica* (Turin 1890, 5th ed. 1915; tr. by E. M. Borchard as *International Law Codified*, New York 1918), embody his ideas for the regeneration of the international legal order. He was a disciple of Wolff in his views on the safeguarding and progressive development of international law through a periodic legislature, a conference of nations to make the necessary political readjustments and to interpret ambiguous rules, and a court of arbitration. He opposed any permanent confederation of states in which the Great Powers should prevail and any combination, such as Rousseau's Project of Perpetual Peace, designed to maintain the status quo. International law, he believed, should not be fixed but should change with the times. He maintained that individuals had certain rights which should be available to them through judicial and political protection in and against any state. These international rights of man would include freedom of emigration, of entry and of ownership of property in a foreign state. He believed that foreign policy should be controlled by public opinion and opposed both secret diplomacy and alliances. Many of the ideas which he advocated have since been adopted in formal instruments;

others command general intellectual support. Fiore was a realist and a persistent fighter against the chauvinism and political and economic shortsightedness which have made war an inherent part of the international system.

EDWIN M. BORCHARD

FIRE INSURANCE

AMERICAN. American fire insurance grew along lines first developed in England. The great fire of 1666 shocked the inhabitants of London into a realization of the folly of not setting aside reserve funds against such an emergency, and the next year Nicholas Barbon took the first step toward creating the modern fire insurance industry when he agreed to repair or indemnify any building attacked by fire, timber houses to be charged double the rate for brick. In 1680 he and several partners founded the Fire Office. From 1681 to 1683 the City of London underwrote fire risks at rates lower than those asked by the Fire Office but the courts ended this experiment, deeming it a usurpation of power. The first so-called mutual fire insurance company, the Friendly Society, began operations in 1684; the first mutual fire company to share profits as well as losses was founded in 1696. The insurance of personal property was first undertaken by the Sun Fire Office, organized for this purpose in 1706. When in 1720 the Bubble Act chartered the Royal Exchange Insurance Company and the London Assurance Company, accepting the £300,000 which each offered the crown for the privilege of conducting a joint stock insurance business, the organization of the British fire insurance industry became substantially what it is today.

As the American colonists accumulated wealth in the new world they too felt the need for protection against loss from fire. There are records that a "Friendly Society for a Mutual Insuring of their Houses against Fire" was founded in Charleston, South Carolina, as early as 1736. The effective beginning of organized American

fire insurance, however, dates from 1752, when Benjamin Franklin helped to organize the Philadelphia Contributionship, a mutual company which is still in existence. Its plan of operation was similar to that of the Amicable Contributionship of London, known as the Hand-in-Hand, and it had the same house mark of clasped hands. The Insurance Company of North America, the first American stock company, was founded in 1794. By the close of the century there were about ten mutuals and four stock companies in the United States.

The pioneering stage in American fire insurance extended to 1835, when the great New York fire of that year wiped out twenty-three of the twenty-six New York companies. There was little state regulation during this period, and policyholders' security depended principally upon current premium income and the good faith of the men behind the companies. In smaller communities fire losses were generally borne by neighbors, who made voluntary contributions to the unfortunate family.

The years from 1835 to the close of the Civil War, using Oviatt's classification, may be characterized as the second period in the development of fire insurance in America. As early as 1837 Massachusetts required the maintenance by insurance companies of an unearned premium fund; this policy was followed by the state of New York in 1853, thus establishing the modest beginnings of state supervision for the protection of the public. At the same time the public distrust resulting from the destruction of the great majority of New York companies by the fire of 1835 led to the wholesale creation of mutual companies. Sixty-two mutuals had reported to the New York comptroller by 1853; most of them later failed. The short lived prohibition of foreign corporations was lifted as a result of the fire of 1835. The period is also noteworthy because of the development of the agency system, which enabled companies to spread beyond their immediate localities and thus obtain the benefit of a broader distribution of risks.

The third period beginning with the close of the Civil War has been described as the period of cooperations. Cooperation was essential because competition had made rates dangerously low and conditions were chaotic. In 1866 the companies of the country organized the National Board of Fire Underwriters, which for the first ten years exerted a stabilizing influence on rates and on commissions. Mill and factory mutuals,

organized primarily on the basis of fire prevention work as distinguished from indemnity, stimulated the stock companies toward cooperative action in the reduction of the nation's fire waste. When the National Board's cessation of its rate making activities led to renewed demoralization, local associations undertook this function. Still later cooperative organizations were formed for inspection and for the adjustment of losses. In many states these early cooperative efforts were at first strenuously opposed and limited by anticompany and antitrust legislation. But in recent years, particularly within the last decade, the advantage to the public of cooperative action by the fire insurance business for legitimate purposes has been recognized more and more clearly by legislative bodies.

Since 1868, when the United States Supreme Court rendered its decision in *Paul v. Virginia*, the several states and territories have assumed full supervisory powers over all alien, foreign and domestic concerns transacting insurance within their borders. The comprehensive New York insurance law is the most important, since almost all companies transact business in that state. Few business enterprises are regulated so thoroughly by statute as are all forms of the insurance business. In fact, the legislation is so voluminous in most leading states as to require publication in a separate insurance code. Briefly summarized, these statutes regulate the following practices: incorporation, organization and operation of companies; investment of capital, surplus and other funds; classes of insurance which the companies may write and the financial requirements governing each class; taxation of underwriters and the procedure of enforcing the same; reinsurance; licensing and regulation of agents and brokers; types of policy provisions and the enforcement of standard policy provisions; prohibition of misrepresentation, fraud and other unfair practices; and the imposition of penalties for the causing of fires. Enforcement of the statutes is entrusted in nearly all cases to the insurance commissioner of the state, who is usually appointed by the governor. He is empowered to revoke or suspend any company's license because of failure to comply with any law or because assets appear to him insufficient. All outside companies must have his permission to transact business within the state. In many states he may revise discriminating or excessive rates or require companies to belong to rating bureaus, which he supervises.

Certain legal and technical aspects of the fire

insurance business require some elaboration. Consideration might first be given to the nature of the insurance contract. No person may sign a fire insurance contract who does not have an insurable interest which justifies the insurance. The courts have interpreted this pecuniary interest broadly, to include every reasonable relation or liability with respect to property. Although the laws of the states vary, there is general agreement that an insurable interest exists in the case of custodians of property (warehouse and commission men, common carriers, assignees in bankruptcy, agents, administrators of estates, etc.), possessors of contractual rights (consignees, patentees, contractors paid on completion of work, etc.) and creditors and pledgees of all kinds as well as actual owners of property.

Although relating to the property insured the fire insurance contract is a personal contract insuring the owner of the property or the possessor of an insurable interest therein. The character of the owner is quite as vital a factor for the insurer to know when assuming the risk as is the character of the property. Policy contracts therefore may not be transferred automatically between owners following an exchange of ownership of the properties insured. Instead, the consent of the insurer is necessary to a change in the title of ownership or the original contract is invalidated.

The contract is one of indemnity. It insures only, as the standard fire insurance policy of New York specifies, "to the extent of the actual value . . . of the property at the time of the loss or damage . . . against all direct loss and damage by fire . . . to an amount not exceeding \$" It is therefore expressly declared that the face of the policy shall not be the measure of the indemnity obtainable in the event of a total loss. Instead, only the actual loss suffered is paid; the insured is not entitled to profit from a fire at the expense of the insurer. Moreover, under the legal "doctrine of proximate cause" the fire insurer is liable only, unless otherwise expressed in the contract, for loss which is directly caused by fire.

Many states have adopted so-called "valued policy laws" designed to provide for the payment of the full face value of the policy in the event of the total loss of the insured property. In some instances it may be desirable and even necessary, especially with respect to articles difficult to value, such as art objects and the like, to have an understanding between insured and insurer as to the amount to be paid in the event

of total loss. In that case the policy is known as a "valued policy." But in general the compulsory application by law of the valued policy idea in fire insurance is inconsistent with the principle of indemnity. Its introduction was followed by increased fire losses. To avoid moral hazard such a practise presumes that the insurer has the privilege of appraising accurately all risks in advance. But this is impractical because values are constantly fluctuating and detailed appraisals are expensive. Moreover, only a few properties, relatively speaking, are ever visited by fire. It is therefore much cheaper for the community as a whole to have the owners themselves estimate the value of their properties at the time insurance is effected and then have an adjustment made of the actual loss suffered in the comparatively few fires occurring in the course of a year.

According to the standard fire policy the insurer is liable only for the actual cash value of the property lost or damaged as "ascertained with proper deductions for depreciation." In no case, however, may "the loss exceed what it would cost to repair or replace the same with material of like kind and quality within a reasonable time after such loss or damage," and so on. The insurer has therefore three options of settlement: payment in cash, restoration through repairs or replacement. In event of disagreement the dispute is settled in accordance with the appraisal clause of the contract. Both the insured and the insurer select an appraiser and the two appraisers select a disinterested umpire. Should the appraisers be unable to agree, their differences only are submitted to the umpire for decision.

Under the important practise of coinsurance, known in England as average, "the insured has any loss paid only in the proportion that the amount of insurance taken bears to the amount of insurance that the company requires him to carry." Thus if a \$100,000 property is insured for only \$40,000 when the required amount of insurance is 80 percent of the value, or \$80,000, a \$10,000 loss would be paid only in the proportion that \$40,000 bears to \$80,000, or to the extent of only one half, i.e. \$5000. The percentage of required insurance represents that portion of the property which is regarded as destructible and will therefore vary in accordance with the type of property. The reason for the practise is clear. By far the greatest bulk of losses results from partial fires, and in large cities probably half of the fire waste consists of losses which amount to less than 10 percent of the value of the

property involved in the fire. It would be highly unjust to those who insure adequately to permit owners to take insurance in small amounts at the same rate as is charged for the larger amounts and to receive payment in full for their small losses. Where it is insisted that all losses be paid in full irrespective of the amount of insurance carried, the premiums should be increased as the insurance decreases. This plan is followed in certain jurisdictions, especially where laws against coinsurance exist, and is known as the graded rate system.

Since fire premiums constitute a material factor in the cost of operation of a property, it is vital that there should be equity in the ascertainment and distribution of risk as between different communities, different industries and different owners within the same industry. Such equity requires that there should be "merit rating" based upon an analysis of the good and bad features of the risk insured. Proper recognition must be given to the fire prevention facilities of the city, the quality of construction of the risk to be rated, the presence or absence of fire fighting facilities, the nature of the occupancy, the character of the exposure hazard and similar factors.

Prior to 1900, when it was common to make rates on mercantile risks on the basis of "judgment rating," the premium was the result of the individual opinion of some rater. But as properties became more complicated in their construction and numerous appliances were installed for heating, lighting, ventilation, transportation, power and other purposes, this method became increasingly unsatisfactory and was superseded by "schedule rating." Alfred Dean's system of analytic rating is used extensively in the middle west; the Universal Mercantile Schedule, in the east. Simple types of property—schools, churches, residences—are usually given a class rating; but mercantile risks are rated on the basis of a comprehensive schedule which is applied by a central bureau of the underwriters' association having charge of the particular territory, to which practically all the companies are subscribing members. The schedule represents a composite judgment system of rating and eliminates the shortcomings of individual rating. By showing on paper how the rate was derived it enables the insured to know his defects and to eliminate them in the interest of a reduction in his premium. But even combined judgment is not so accurate as figures of actual fire losses.

Fire insurance premiums are collected in ad-

vance, usually on one, two or five-year policy periods, but they are "earned" only as time elapses. The insurer is therefore held accountable as a custodian of the unearned portion of the premium, or the reserve, as this unearned fund is commonly called. State statutes require the maintenance of such a fund as a necessary condition for financial solvency. Nearly everywhere the law requires that insurance companies shall maintain a reserve equal to "fifty per centum of the premiums written in their policies upon all unexpired risks that have one year, or less, to run, and a pro rata of all premiums on risks having more than one year to run."

It is common practise for underwriters to transfer a portion of the liability assumed under a policy to some other underwriter, who is then known as the "reinsurer." Many plans of reinsurance exist, such as reinsurance under agreements covering specific risks, "reinsurance clearing houses," "share" or "participation arrangements," "excess reinsurance agreements" and the like. But whatever the plan, the fundamental reason is the avoidance of a loss out of line with the writing capacity of the insurer. The practise gives underwriters the greater stability resulting from a wide spread of business. It also enables them to accept large policies promptly, since they know that the risk is automatically distributed over numerous other underwriters who are parties to the agreement.

Many insurance companies write forms of insurance similar to or closely related to fire insurance. Thus many, especially farm and state mutuals, frequently combine tornado, frost, hail and other storm insurance with the fire coverage. Sprinkler leakage insurance is also closely connected with the fire hazard, although this type of coverage is usually classified as one of the casualty forms. Stock fire insurance companies also furnish riot and civil commotion and earthquake insurance in addition to their fire insurance policies. Many also write marine insurance and automobile fire and liability insurance.

Most common of the related forms of risk, however, is the business interruption hazard. The fire insurance contract protects only against the loss of physical property. Yet in many instances a comparatively small fire seriously interrupts business and through such interruption causes serious indirect time losses, such as loss of net profit and loss resulting from unavoidable fixed charges and overhead. Such losses are assumed by underwriters through use and occupancy insurance, commission insurance, rent in-

sureance and other analogous forms of coverage.

The American public is now paying in excess of \$1,000,000,000 in premiums to fire insurance companies protecting over \$100,000,000,000 of property. This protection is assumed by domestic stock companies, foreign companies, local, state and factory mutuals, reciprocal or inter-insurer organizations and Lloyd's associations in the order of importance named. In addition a large amount of insurance is sent directly by cable to alien underwriters not licensed to do business directly within the United States. Note should also be taken of the various municipal and other public funds for the insurance of public property and the ever growing list of self-insurance funds conducted by large corporations and other owners of widely distributed properties.

Stock companies transact probably about 75 percent of the nation's fire insurance, and on them property owners in the larger cities are primarily dependent for adequate protection. Local and state mutuals which write about \$10,000,000,000 of fire insurance, or roughly 10 percent of the total, are strongest in the agricultural districts and the smaller cities. Factory mutuals have outstanding between \$9,000,000,000 and \$10,000,000,000 of insurance on factory properties, or about another 10 percent. The balance of fire insurance written within the country is assumed by interinsurer organizations and Lloyd's associations.

The ratio of losses paid to premiums received by companies as reported for all states by the *Weekly Underwriter* averaged only 51.8 percent from 1900 to 1923. The ratio for all companies reporting to the National Board of Fire Underwriters for fire and lightning protection declined to 46.5 percent in 1929 and in 1930 jumped to 53.6 percent. At the same time the average rate charged for \$100 protection has decreased from \$1.0118 in 1919 to \$.9132 in 1926 and to \$.7691 in 1930 for fire and lightning protection. This declining rate probably indicates increased competition and more fireproof construction rather than excessive profits.

Although municipal fund insurance has been fairly satisfactory, comparatively few cities have undertaken the plan. A survey indicates that only about 10 percent of American municipalities have insured public properties through the medium of a public fund organized for the special purpose. The overwhelming majority of cities rely upon private companies. Insurance by larger cities of their public school property has

resulted in considerable saving. Large losses do occur occasionally, and it is difficult to rely upon a ten or twenty-year loss experience which may be nullified by a single fire. By 1927 six states had established emergency reserve appropriation funds; five, self-insurance funds that reinsure with old line companies. But in two others, Michigan and Minnesota, these funds had become exhausted by the failure of the legislatures to appropriate premiums each year. Nine states, including New York, do not insure their property at all. Even where public insurance funds exist the best opinion seems to hold that they should cover small properties only and that large or hazardous risks should be placed or reinsured with private companies.

Prior to the organization of factory mutuals the function of fire insurance was regarded primarily as risk bearing, whereas today the emphasis is increasingly upon risk prevention. Underwriting profit may be even larger with small premiums, where losses are kept down, than with higher premiums when losses have a tendency to be large and to deviate widely from the expected average. More and more therefore a larger part of the premium income has been devoted to the elimination of fires. The National Board of Fire Underwriters, representing the stock companies, has been responsible for the preparation of a fire prevention manual and the publication of scores of handbooks dealing with fire preventive appliances, fire retarding materials and types of construction. It has expended considerable effort on public education; it has carried through several hundred municipal surveys for the guidance of those in strategic positions to improve conditions, and it undertakes the inspection and supervision of the installation and maintenance of electrical, sprinkler and other types of equipment. The Underwriters' Laboratories, a subsidiary of the National Board of Fire Underwriters, tests appliances and materials submitted to it for disinterested investigation and lists and labels those found to be satisfactory. Every effort is also made to detect and punish incendiarism. To this end the National Board has created a Special Committee on Incendiarism and Arson, which cooperates with the various committees of local underwriters' associations. This service is supported by company contributions, and arson investigators are employed to cooperate with local officials in the detection and conviction of those who bring about fires for the collection of insurance.

Recent developments indicate further prog-

ress in various directions. The volume of fire insurance written is likely to increase although less rapidly than in the past decade, when it increased about 100 percent. Emphasis upon fire prevention will also increase. There is reason to believe that before long conflagrations of importance will be excluded from the realm of the expected. Development is likely to be great in the direction of a properly educated field force able to counsel the buyers of insurance. Companies are rapidly installing educational courses and even educational departments designed to raise the educational level of their vast selling forces.

It is also hoped that greater uniformity of legislation, so long advocated by the National Convention of Insurance Commissioners, will be gradually secured. This is most needed with respect to the adoption of uniform financial reports, policy provisions and regulations, the permission of all forms of cooperation along legitimate lines and the scientific supervision of rates, and in the direction of lower and more ethical taxation. In some states fire insurance companies are taxed to support the fire marshall and to maintain fire departments. Only a fraction of the various fees and taxes paid by them goes to support state insurance departments. Another possible development is that the states will follow congressional legislation for the District of Columbia in abolishing the distinction between casualty insurance and fire and marine insurance.

S. S. HUEBNER

EUROPEAN. European fire insurance is not a uniform institution. It is even impossible to make a systematic survey because of the lack of statistical data and because of inadequate material regarding such vital aspects as legislation, content of insurance policies and rates. In general therefore this article is limited to certain of the more important European countries: to England as the archetype of private insurance enterprise, to Germany and Switzerland as representatives of a mixed system where public and private concerns coexist and to Soviet Russia as a country with a state insurance monopoly. If German insurance receives what may seem undue emphasis, it is because her fire insurance literature is most extensive and because in 1930 she adopted a new uniform general form of insurance policy.

The original unit of organization, of fire insurance as of so many other institutions, was the family. In the Middle Ages the guilds and the

communities were the bearers of the insurance idea. Even in more modern times the guilds continued to perform this function, especially in the northern countries, where the climate stimulated the demand for insurance by forcing people to build solid houses, i.e. to invest more capital in dwellings than is necessary in warmer zones.

Modern fire insurance practises, however, are an outcome of the great London fire of 1666. In England private and mutual insurance enterprises were soon formed, at first, like the old guilds, chiefly local in scope; early in the eighteenth century joint stock companies, able to conduct a wider business, were organized. German insurance, on the other hand, followed a different course. Municipality and state, fearful of conflagrations, prescribed compulsory insurance through public insurance offices. In 1676 the trading town of Hamburg established the first public insurance office by uniting forty-six small *Kassen*. Gradually the other German self-governing units followed this example. The compulsory feature of German insurance can be traced back to the desire of the local treasuries, encouraged by the cameralistic economists (e.g. Georg Obrecht's scheme, 1606), to protect themselves against loss by fire, especially loss to the property of wealthy burghers. The public fire insurance societies were also regarded from the first as useful institutions for the extension of mortgage credit. The insurance of goods did not develop on the continent until long after real estate insurance had become common. In Germany it had no great growth until the end of the eighteenth century.

With the rise of individualistic principles the idea of profit invaded the field of fire insurance. In many European countries the importation from England of the joint stock insurance company led to the organization of similar home companies. The first stock fire insurance company in Germany was organized in Berlin in 1812. In France too modern fire insurance is a postrevolutionary development; none of the earlier enterprises survived the upheaval. For most European countries the latter half of the nineteenth century was not unnaturally the period of greatest development. At present the joint stock companies dominate the field. By their inherent elasticity, enterprise and openness to new ideas they have generally forced other forms of enterprise into the background. Public fire offices have survived in the countries where they have been organized, but their operations are limited as to region and also at times as to the

type of business they may handle; while the private companies tend to widen their activities, often spreading beyond national boundaries.

A glance at the trend of the last fifty years reveals, in addition to the growth in the number of private insurance companies, a steady increase in the total value of the insurance underwritten and in premium receipts. At the same time there has been a general decrease in the premium rate, due for the most part to the increasingly successful fighting of fires and to the spread of fire-proof building. The classification of risks and the establishing of rates have become more and more precise and elaborate. The provisions of the insurance policy have in many countries been revised in favor of the insured. These advances, however, have been counterbalanced to a certain extent by the marked post-war increase in the cost of administration, caused in part by the increase of the tax burden. The cost of administration of five large English stock companies, expressed as a percentage of the premium receipts, rose from 39 percent in 1920 to 42 percent in 1928; Swiss company costs rose from 35.5 percent in 1910 to 39.4 percent in 1926; German from 27 percent in 1910 to 53 percent in 1926, but declined to 48 percent in 1928.

The most characteristic development of the last two decades, especially in Germany, has been the attempt to increase profits by the concentration of insurance capital; that is, by the pooling in one form or another of private undertakings. The increasing formation of composite companies (*Spartenkombinationen*) represents a logical attempt to combine fire insurance with other insurance lines. The company benefits by being able to balance the earnings of the various lines and by using the same agents to solicit them. Europe does not follow the United States in forbidding the combination of fire and casualty insurance, although some countries prohibit the combination of fire and life insurance.

In spite of increasing concentration fire insurance protection by both domestic and foreign companies is still in excess of requirements in most European countries. Competition has forced down premiums to a point that threatens the profitability of the business. In consequence associations of fire insurance underwriters, which aim more or less consistently to guard the interests of the insurance institutions, have assumed greater importance in the last ten years. These associations, often actual cartels, have been organized by the public offices as well as by the private companies. One of their activities

has been the conclusion of agreements covering the provisions of the insurance contract and the amount of the premium, which may be binding or are sometimes merely officially endorsed standards.

The external organization of the private fire insurance business in Europe resembles the American too closely to call for description here. There is need, however, for a more detailed examination of the way in which government fire insurance is conducted by quasi-public institutions. At present public fire insurance offices exist in Germany, Austria, Switzerland, Denmark, Norway, France, Poland and Lithuania. Soviet Russia is the only European country in which private insurance companies do not operate.

In Germany there are, in addition to some seventy private companies, forty-one regional public fire insurance offices. These offices are as a rule public corporations operating as mutual societies and directed by officials of the administrative area served by the office. Their reserve funds are in certain places guaranteed by the local administration. Some cover a whole state, as Bavaria and Saxony; some only single provinces or districts, as parts of Prussia; or individual cities, as Berlin. Compulsory insurance of buildings through public offices still exists in certain places (e.g. Berlin and Hamburg); elsewhere the public offices compete with the private companies in this field. The majority of the public companies, however, limit their activities to the insuring of simple risks, like dwelling houses, farm buildings and small business buildings. A few public companies also handle a considerable range of industrial and larger commercial risks. Only about half insure goods as well as buildings in appreciable amounts. In 1927 the net premiums of the public institutions amounted to RM 178,000,000 and losses to RM 104,000,000, as compared with net premiums of the private companies amounting to RM 154,000,000 and losses of RM 62,000,000.

In Switzerland, where public insurance has long been organized by cantons, the underwriting of chattel insurance is particularly interesting because of the diverse forms of organization, ranging from complete state monopoly through mixed state and private insurance to control by private companies. The fact that four French departments maintain public fire insurance offices shows that government insurance is not peculiar to Germanic countries. Organization of new public offices is, however, no longer possible under French law.

A very important form of fire insurance first devised in 1880 is forest fire insurance. Formerly the fire insurance companies almost without exception refused to insure woods against loss by fire; although various German groups have continually sought to introduce this form, it is as yet in an early stage of development, and of the damages arising from forest fires in Germany probably less than 8 percent is covered by insurance.

An inclusive state fire insurance monopoly has been in operation in Soviet Russia since 1920. Insurance of all buildings, both city houses and farm property, is compulsory. In 1930 the compulsory provision was extended to include the protection of public, communal and cooperative institutions against all natural risks, including the insurance of their movables to their full reproduction value without allowance for depreciation. This is undoubtedly the most comprehensive insurance of property values ever attempted. Voluntary insurance can be also placed with Gosstrach, the public central insurance office. It is worthy of note that Gosstrach has concluded reinsurance treaties with foreign private companies.

A comparison of the premium rates in those countries where public and private companies operate side by side shows that the public offices usually ask a lower rate, especially when a compulsory insurance provision allows them to dispense with advertising. But even where the private companies demand higher premiums these companies are none the less often the more popular. The least attractive of all types are the small local or limited membership mutual societies.

In Germany neither mutual insurance nor self-insurance has been able to make much headway against the stock companies. In France, however, the big mutual companies handle about a quarter of the insurance business. In addition an attempt has been made to encourage agricultural cooperatives by subvention. Italy also grants special favors to the mutuals that are part of the cooperative movement. An interesting experiment by Belgian agricultural unions was the organization of the Syndicat Agricole to be their agent in dealing with the stock companies.

The World War and its consequences have led to several interesting developments. The severe air warfare caused the extension, particularly in Germany, of fire insurance policies to cover damage resulting from bombings. In England a government insurance office was organ-

ized to cover air risks, for which some fifty private companies acted as agents. The central European countries attempted to counteract the unforeseen and serious underinsurance resulting from inflation by offering policies with sliding scale values based on index numbers or on the dollar. A further result of the economic stress was the introduction of reproduction value policies (replacement insurance) for detached buildings. This type of policy is less common in England than in Germany, where since 1924 it has applied both to dwellings and to industrial plants with rebuilding as a prerequisite for indemnification. Switzerland and Czechoslovakia have opposed the introduction of replacement insurance, fearing an increase in fires. The results of the experiment in England and Germany are still uncertain, as few such policies have been issued.

The extension of fire insurance to include profit insurance, use and occupancy insurance and the like, so widespread in America, is common in Europe also, especially in England; most German companies, however, refuse this business. The comprehensive policy is growing in favor in England and Holland for both real and personal property. A single contract insures not only the fire hazard but also risks of forcible entry, burglary, liability and so on. In Germany the comprehensive policy known as the *Veredelungspolice* protects against fire and other damage imported raw materials which are to be re-exported as finished products.

State regulation of private companies, especially in Germany, Austria, Switzerland and the Scandinavian countries, is similar in principle to the American. Provision is made for adequate premium reserves, investments are regulated and foreign companies are usually required to make a large deposit. Only France attempts to regulate rates. A significant provision of the code of certain German states is the enforced pooling by the operating companies of extraordinary risks which otherwise might not be underwritten. With the exception of the French code legislation governing the insurance contract protects the insured in important particulars. In all other countries the rights of the policyholder are confined to the provisions of the policy as drawn by the companies, often too drastic in their requirements. English fire insurance companies are merely required to deposit £20,000 and to make adequate annual financial reports. The criminal laws of certain countries treat fraudulent action with particularly heavy penalties. In France,

where the individual is held liable for damages to others caused by fire on his premises unless he can prove his innocence, the fire loss is unusually low.

FIRE PROTECTION. The need for protection against the hazard of fire has been forcibly impressed upon mankind by a long experience of destruction and loss. A list of places that have suffered disastrous fires would include most of the principal cities of the world. The burning of Rome in 64 A.D., the great fire of London in 1666, the Chicago fire of 1871, the San Francisco earthquake and fire of 1906 and the Tokyo earthquake and fire of 1923 are instances of the terrible damage that can be worked by fire. Less completely destructive but serious fires have

occurred in most of the cities of Europe and the Orient. More recently settled countries, such as the United States and Canada, have repeated the fire experience of the European countries. The rude huts which housed the first settlers at Jamestown, Virginia, burned within one year; the statehouse burned down four times before the end of 1698 and the church twice. Certain of the American colonies, like Pennsylvania, took fire hazards into account when planning their towns, an effort which has apparently been reflected in their fire experience. As the pioneer line moved westward, however, urban centers were often planned with less care and many cities went through disastrous fires before establishing effective regulations governing building construction and fire protection. But as such regulations cannot greatly modify existing construction, many cities still include potential conflagration areas. Disastrous fires in the United States in the last hundred years have caused losses of property and life possibly exceeding those of any similar period in the world's history. The Boston fire of 1872 and that in Baltimore in 1904 are charged with property losses of \$75,000,000 and \$50,000,000 respectively. The property loss resulting from forest fires, many of which have destroyed communities in their paths, has at times equaled that from some of the more severe city fires. More recently burning oil wells and oil storage tanks in city areas and fires involving burning oil on harbor waters have caused heavy losses.

In 1930 the fire losses in Great Britain and Ireland as reported by the British National Fire Brigades Association amounted to \$51,125,428, or \$1.27 per capita. For Canada the figures as collected by the Dominion Fire Prevention Association were \$46,109,875, or \$4.70 per capita. For the United States the loss in 1930 may be given as \$499,739,172, or \$4.07 per capita, on the basis of records of the Actuarial Bureau of the National Board of Fire Underwriters with 25 percent added for uninsured and unreported losses. Fire losses for these countries have remained relatively stable for the past decade, with greater variations from year to year in Great Britain and Ireland than in the other two countries. A steady decrease in per capita loss in the United States from \$4.90 in 1924 to \$3.81 in 1929 is perhaps significant considering that the value of property subject to fire increased during the period. The lower per capita loss for the United Kingdom may be ascribed in part to the fact that per capita wealth is less than in the

United States and Canada. Differences in building construction as well as in fuels and lighting and the habits of the people may also be important. The isolated American farm continues to be at the mercy of an accidental fire and the thatch roofed villages of Europe suffer heavy losses.

The figures for property loss do not represent the total cost of fire to the community. For the United States the life loss as based on the statistics gathered by the census bureau now approximates between 6000 and 8000 lives per year with as many or more serious injuries. About 25 percent of the deaths by fire occur in burning buildings; the rest are due to such causes as burning clothing, forest fires and the like. The cost of fire protection and the cost of insurance must also be included in the fire waste total.

Until comparatively recent times the only relief given to victims of fire was contributed by other individuals or communities. The business of fire insurance, which originated soon after the London fire of 1666, has only recently attained large enough proportions to compensate for the losses sustained in general city conflagrations. After the Chicago fire of 1871 many of the insurance companies failed. The insurance losses incurred in the Baltimore and San Francisco fires were more fully paid. While the funds thus obtained are important in rebuilding burned cities, other forms of public aid are generally necessary for both relief and reconstruction.

The general factors contributing to the fire hazard can be classified as climatic, racial and material. Prevailing temperature, humidity and winds often determine whether a fire can attain dangerous proportions; climate also determines the extent to which artificial heating of buildings is necessary, thus influencing the portions of the total fire loss attributable to this cause; fire losses are heavy in earthquake and volcanic zones. Various racial traits and customs may be conducive to the origin of fire: for example, the worship of household gods by means of continuously maintained fires constituted an element of fire hazard. In congested communities the material, design and spacing of buildings are probably the most important factors. Modern fire zoning has helped measurably in decreasing the hazard of general conflagrations.

Fire protection may take the form of elimination of the causes of fire, reduction of fire hazards, prevention of the spread of fire and provision of means for its extinction. In modern times reduction of fire hazards through restric-

tions on construction and less frequently through restriction of extra hazardous occupancies in congested urban areas has become increasingly widespread. Heights and areas of buildings have been limited and certain types of materials have been proscribed within given areas in most modern municipalities. Such restrictions on construction have their justification in the different degrees of hazard involved when buildings of the various types of construction burn or are exposed to fire. The frame building with combustible frame and walls is most subject to destruction by fire. The masonry walled, wood joisted building is protected in part against exterior fire hazards by the wall construction. Openings in the wall do not wholly destroy the efficacy of this protection, for the wall provides a barrier from behind which fire attempting to enter at the openings can be fought; protections in the form of metal frame windows with wire glass, metal doors and shutters can also be provided. A severe fire, however, involves the collapse of floors and roof construction and generally the partial collapse of walls, after which the building burns as a unit with a large unrestrained volume of flame, hot gases and possible flying brands. The conflagration hazard is present with this type of building, particularly if it shelters large amounts of combustible materials. In recent years there have been developed what are termed fire resistive, or fireproof, buildings that can withstand a complete burning out of combustible contents and trim without the collapse of major structural members. The fire volume in such buildings is broken up by the floor, roof and wall constructions, and the exit of flame and hot gases can take place only through the wall openings. In addition to general fireproof construction special safeguards and regulations have been devised to protect explosives and highly inflammable materials, such as celluloid films. In the highly developed districts of many American cities fire resistive construction predominates to such an extent and facilities for the extinction of fires are so readily available that the possibility of general conflagration is remote.

Statistics on the fire loss in the United States indicate that about 15 percent is due to fires communicated from other burning buildings. Most of these communicated fires involve only one or a few structures. The loss from general conflagrations does not constitute more than a small percentage of the ordinary yearly loss. A somewhat greater loss, in the neighborhood of 25 percent of the total, is caused by heating,

cooking, lighting and power supply. The careless disposition of matches, cigarettes and other smoking materials is charged with some 10 percent of the total, spontaneous combustion with 4 percent, sparks on combustible roofs with 5 percent, petroleum and its products and lightning with approximately 3 percent each. Incendiarism is charged in the fire records with less than 1 percent of the total loss, but this refers only to cases of proved arson, conclusive evidence on which is generally difficult to obtain.

A study of the predominating causes of fire indicates that at least one half of the property loss is from fires which might be prevented by the application of a reasonable degree of care and knowledge. It is difficult to draw the line between lack of knowledge and lack of care. Such an act as the careless throwing of a lighted match may have to be repeated a great number of times before it results in a fire, but it is the function of fire prevention to bring the individual face to face with the experience of the community as a whole so that he may realize that it is the one case out of a hundred or thousand or more that brings disaster. The regularity with which approximately the same percentage of the aggregate loss from year to year is caused by similar acts is striking.

Individual liability for fires has been advocated in the United States as being conducive to increased caution. During the Middle Ages in England inquests were held on fires which had resulted in loss of life or property, but apparently they were conducted in a manner resulting in oppression as they were one of the grievances from which Magna Carta asked relief. By an act passed during the reign of Queen Anne it was provided that no action should be maintained against any person in whose house a fire had accidentally begun. Attempts to revive personal liability laws in both the United Kingdom and the United States have met with opposition, although arson is punishable by common law. The laws in France and some other European countries contain provisions originating in the *Code Napoléon* holding the property owner or tenant responsible for fire damage to adjoining property. While these undoubtedly result in reduced fire losses, they impose both a large burden of responsibility and the cost of carrying adequate insurance. Personal liability laws in effect in the United States apply only in case of violation of local fire prevention regulations.

Organization and equipment for the extinction of fires have been in existence at least since

the time of ancient Egypt. The plans of organization have involved compulsory, paid and volunteer service and combinations of the three. Compulsory service is at present resorted to only in case of forest fires and conflagrations. In the United States the larger cities and communities have paid fire departments, while villages, townships and the smaller cities have volunteer or a combination of volunteer and paid forces. Volunteer firemen are generally compensated for time spent at fires and drills and some communities provide disability and retirement benefits. Good sized communities are dependent mainly on volunteer forces less often in the United States than in Europe. In Paris and Berlin the fire fighting force is directed by the police department.

Since the middle of the last century the function of fire extinction has everywhere been taken over by municipalities. In the United States, however, fire insurance companies still maintain salvage corps in larger cities to reduce damage from fire and fire extinction, although some cities have also assumed this function and added rescue and ambulance units. The adoption of mechanical fire fighting machinery has involved the establishment of highly trained bodies of paid firemen. New York has established a firemen's college. Wages have risen and shifts have been reduced from twenty-four hours to twelve and in some places to eight. In view of the increase in fire resistive construction in the more highly developed districts of modern cities, the increase in speed and effectiveness of fire fighting equipment, improvements in water supply, standardization of hose couplings and improvement in roads, which makes aid from neighboring communities more readily obtainable, it is pertinent to take note of the high cost of the fire service in many communities and to ask whether reduction in the number of fire stations and in the general cost of public protection cannot be made.

Equipment for fire fighting has evolved from the leather bucket and hand operated squirts or pumping engines used until nearly the middle of the last century to the motor propelled engine capable of delivering 300 to 1500 gallons per minute under pressures up to 250 pounds per square inch. High pressure water mains, elevated hose towers, mechanically operated ladders, gas masks, asbestos suits and special illumination have increased the effectiveness of the fireman's work under difficult conditions. The fire ship has facilitated the fighting of marine and water front fires. Public fire alarm systems

with electrically supervised connections giving coded signals from operation of outside boxes are provided in most cities, although some communities of considerable size depend on the public telephone for this purpose. Where both are available many more alarms are received by telephone than from the public boxes and the percentage of false alarms is smaller.

Equipment for private protection is usually present only in mercantile, manufacturing and public establishments. Hand fire extinguishers, standpipe and hose and automatic sprinklers are the most common devices. Manual or heat actuated fire alarm systems are also provided in some establishments to assist in speedy detection and extinction. The majority of large establishments and institutions hold fire drills to lessen the possibilities of panic in case of fire. Public halls and theaters, after several disastrous fires, have been subjected to special regulations regarding fire exits and preventive devices.

Education, standardization and research in the field of fire protection are conducted in this country by the National Fire Protection Association and several state associations. Many states have appointed fire marshalls to inspect local fire hazards and guard against lax enforcement. Excellent work is done by the insurance companies; the stock companies are represented mainly by the National Board of Fire Underwriters and the mutual companies by the Associated Factory Mutual Fire Insurance Companies and the National Association of Mutual Insurance Companies. Fire tests of materials, building constructions and devices and fire protection equipment are made mainly for purposes of insurance ratings by the Underwriters' Laboratories and the Factory Mutual Laboratories. Similar tests are made by Columbia University for the city of New York as well as for the public. The Bureau of Standards of the United States Department of Commerce has conducted researches in the general field since 1914. The Federal Fire Council was organized in 1930 to function in an informatory and advisory capacity on matters pertaining to fire prevention and protection on government properties. Abroad, the British Fire Prevention Committee was active in testing and educational work from 1898 to 1924, when its work was taken over by the National Fire Brigades' Association. National and regional fire prevention associations are functioning in many countries and some experimental work on fire resistant building details has been conducted in France, Germany and Sweden. In general

researches on fire resistance are less fully developed than those pertaining to ordinary service conditions of materials and equipment.

FISCAL SCIENCE. The discipline which deals with the public household, that is, with the revenues and expenditures of the state and the relations of the individual to the public treasury, is in every language but English called the science of finance. This is to be explained by the fact that the term finance, although originally applied to money concerns only (from *finare*, to put an end to a matter, especially by the payment of money), acquired at a very early period on the European continent a public connotation. In the sixteenth and seventeenth centuries in France the financier had come to mean a government expert in public revenues and expenditures. Consequently, when the science first developed, as it did on the continent, it was called the science of finance.

Finance, however, never quite lost its original wider connotation. The French of the eighteenth century as of today speak of *haute finance* in referring to the activities of private bankers and financiers. In England this more general scope of the term remained the prevalent one. Even at the present time every treatise on economics in England has its sections dealing with finance in the sense of monetary and banking topics. When therefore at the end of the nineteenth century the subject in its more restricted and special sense was erected into an independent science, the question of a descriptive title arose. The term science of finance could not well be chosen because the field had already been preempted by books like Patterson's *Science of Finance* (1868), which dealt exclusively with monetary topics. The attempt of Thorstein Veblen to use "science of finance" in his transla-

tion of G. Cohn's *Finanzwissenschaft* (1895) and of Henry C. Adams, who had studied in Germany, to publish at the turn of the century *The Science of Finance* (1898) in the European sense met with scant favor. Slowly it became customary, both in the United States and in England, to speak of "public finance" in contrast to the ordinary monetary and banking topics. The science has accordingly almost everywhere in the English speaking world become known as the science of public finance.

Recently the term fiscal science has been suggested as a more appropriate name than the science of finance or the science of public finance. It is derived from the Latin *fiscus* (originally the rope basket into which the public moneys were put), which the Romans applied to the treasury and which is used on the continent in the same sense. In English the term has become so ingrained that fiscal matters are never in danger of being confused with ordinary financial or monetary affairs. Inasmuch as the word fiscal has an exclusive public connotation, it is unnecessary to use the circumlocution of public finance. The appropriateness of the term seems to be beyond dispute. It does not carry the misleading connotation of the older term science of finance and it is less awkward than the science of public finance. It will also be far more convenient to speak of fiscal theories rather than, as at present, of theories of public finance or of the still more cumbersome theories of the science of finance (*finanzwissenschaftliche Theorien*). Because of its appropriateness, simplicity and terseness the term fiscal science would seem to deserve acceptance as the name of the discipline of the public household.

EDWIN R. A. SELIGMAN

See: PUBLIC FINANCE; FINANCIAL ADMINISTRATION.

FISHERIES. Fishing was one of man's earliest sources of food supply and it is still one of his most important means of livelihood. Primitive man probably caught fish first with his hand or with a spear; later with a baited line, from which he gradually evolved a rod and line; and finally with a net or fish trap. In the hands of the great fishing peoples of historic times—Phoenicians, Greeks, Norsemen, Basques, Portuguese, Dutch, British, Americans, Japanese—such devices have been slowly transformed into the more efficient methods of the present day. Among the important modern devices are the long line with its hundreds of dangling hooks; the gill net, resembling a huge submerged tennis net, which

entangles the fish in its meshes; numerous types of fish traps; beach seines and purse seines, which are closed about their victims; and the otter trawl, a great flattened bag of netting which is dragged along the bottom like a giant open mouthed fish. Fishing boats too have evolved through countless variations from the early dug-out to the dory, schooner and steam trawler. Technical progress and mechanical improvements, however, have often been retarded by the proverbial conservatism of fishermen; and the slowly growing mechanization of the fisheries has been achieved only in the face of steady opposition and bitter resentment. In recent years much of this resentment has been focused upon the heavy, voracious nets of the steam trawler, which nevertheless is steadily displacing the sailing vessel, especially on the more distant grounds.

Four major methods of preserving fish have been in use since primitive times—freezing, drying, smoking and salting. A fifth, canning, was developed during the nineteenth century. Pickling, although not uncommon, has never been as popular as the others. At the present time canning and freezing (together with cold storage) are the favored methods of preservation in the United States; smoking and pickling are practised most by the nations of northern Europe; drying is employed mainly in the Orient; salting is practically universal.

The requirements of modern marketing have supplemented or modified these traditional processes in various ways. With the aid of ice for packing, fresh fish are shipped "in the round" (just as they come from the water) or dressed. Freezing, however accomplished, must be followed by glazing, which coats the fish completely in a thin film of ice, before the product can be safely trusted to cold storage. Filleting is also increasing in favor. This process, which markets only two choice pieces of meat, virtually free of bones and skin, from each fish, has the added advantage of permitting the concentration of the inedible parts for manufacture into by-products. Fish foods which can be sold in package form are being developed in increasing number, but perhaps the most promising method is that of dehydration. By this process, which involves destruction of the enzymes and removal of the water content of fish meat through pressure, vacuum or warm air currents, there is obtained a highly concentrated food product which may be stored indefinitely. The dried fish of the Orient and the salt fish of the Occident

have long been counted among the few staples in the limited dietary of the masses, and the development of new methods of preservation has but extended the range of use of fish as a food.

The Black Sea and the Bosphorus supplied the Phoenicians and Greeks with their salt fish, in particular, tunny. In the later Greek and the Roman periods the coasts of Sicily and Spain became important fisheries, while Egypt and the rivers of northern Europe sent quantities of fresh fish to the Roman cities. The Carthaginians frequented the seas beyond the Pillars of Hercules, hunting whales and seals as well as tunny.

The prosperity of the Hanseatic League was based largely upon the herring catch, and the subsequent transfer of power from the Hanse towns to Holland has been attributed to the migration of the herring from the Baltic to the North Sea. The wealth of early New England depended upon the "sacred codfish" of the Grand Banks. The present economic structure of Great Britain, Norway and Japan, to say nothing of smaller countries, would be seriously disrupted by the loss of their fisheries; and the peoples of many a stretch of coast line, Labrador, Iceland, Brittany, would be rendered economically helpless without their dominant source of income.

Fishing boats of all nations still gather at the deep sea fisheries to garner from each its particular harvest. Coastal waters too have their own specialties. Alaska concentrates upon salmon and upon the government controlled seal herd of the Pribilof Islands. The Columbia River has become a synonym for salmon. Southern California is devoted to tuna, abalone and sardines; with respect to the last it challenges the traditional supremacy of France. Chesapeake Bay contributes oysters and crabs; the Gulf of Mexico, shrimps; Florida, turtles and sponges; and the Middle Atlantic states, menhaden. New England, less specialized, is still loyal to cod, mackerel, halibut, lobsters and clams. The Newfoundland bankers are commercially interested in only a small number of the varieties of fish life available. Norway has virtually a monopoly in the field of antarctic whaling. The North Sea yields unbelievable quantities of herring. Caviar properly belongs to Russia, seaweed to Japan and coral to Japan and Italy. Japan, however, with a per capita fish consumption which is many times that of meat requires an annual catch which is as rich in variety as it is enormous in quantity.

At the present time the value of the world's annual harvest of fishery products is in round numbers about one billion dollars. The list includes a fascinating variety of items—pearls, buttons, ambergris, coral, tortoise shell, foods, condiments, medicinals, chemicals, jellies, glues, waxes, oils, fats, cements, stock foods, fertilizers, leather, furs, lime poultry grit, sponges, seaweed and whalebone. In weight and variety of annual catch the United States leads with the stupendous total of more than three billion pounds made up of more than one hundred species. The United Kingdom captures annually more than two billion pounds, two thirds of which are contributed by the herring, haddock and cod fisheries. Japan lands five hundred million pounds of herring and a like amount of sardines each year in addition to scores of other commercially valuable fishes. Norway, concentrating mainly on herring and cod, produces more than a billion pounds per annum; and Canada markets about seven hundred million pounds annually, chiefly salmon, cod, lobsters, halibut and herring. In the value of their catches Great Britain, Japan, the United States and France are easily in the lead, with annual totals approximating \$100,000,000 in each case. These sums, plus the less striking contributions of Spain, Canada, Norway, Portugal and Russia, comprise from two thirds to three fourths of the world total.

The industry has within the past generation enlisted science to further its progress. The discoveries of oceanography, biology and pisciculture have begun to replace or at least to challenge the traditions, prejudices and untrained, half true observations which dominated many of the fisheries. Many pioneering investigations into the conditions of fish life have been organized by the United States Bureau of Fisheries at the Woods Hole experimental station and elsewhere and by similar governmental agencies in other countries. The northwest countries of Europe cooperated in founding the International Council for the Exploration of the Sea.

The plentifulness or scarcity of fish depends in large part upon the nature of their food supply. While many fishes feed upon smaller fishes, the primary source of fish food is to be found in plankton—a collective term for the myriad masses of minute marine growths, both vegetable and animal, which float in the shallower waters of the ocean. Plankton, in turn, is plentiful or scarce as the result of a combination of factors including temperature, salinity, density, depth and currents, which are themselves

most profoundly influenced, perhaps, by the ever growing and changing deposits made by rivers upon the submerged continental plateaus. These shallow waters with their teeming animal and vegetable life account for the Newfoundland Banks, the North Sea, the Baltic, Iceland, Alaska and the other famous fishing grounds of the north Atlantic and Pacific.

Plankton would seem to offer one explanation for fish migrations and fish years. When the supply changes or diminishes either with a regular seasonal rhythm or at irregular, unpredictable intervals the fish migrate to more congenial feeding grounds. And when fortune happens to provide an unusually plentiful harvest of plankton just at the time when the young fish are most dependent upon it, a prosperous fish year may be predicted. Such forecasting of fish years has been greatly facilitated by the discovery that fish scales register each year's growth by a circular ring, and consequently fish ages can be read with considerable accuracy.

Another cause of migrations, spawning, is of particular importance because of its intimate connection with the actual or possible exhaustion of certain beds and banks. Forces inimical to fish life, especially in rivers, lakes and coastal waters, are accumulating in many regions, largely because of the growth of industrialism, as in the case of pollution from the waste products of cities, factories and steamships, or the building of dams, which prevent fish like salmon from migrating to their spawning grounds in the upper reaches of rivers. In the deep sea fisheries, including whaling and sealing, the great menace is overfishing. In recent years vigorous conservation measures have been undertaken by many countries in an effort to protect or to restock depleted grounds. Legislation and treaties have provided for closed seasons or have prohibited fishing entirely in certain waters or have forbidden the catching of fish below a specified size, often by outlawing undesirable types of fishing gear. Fish hatcheries have been entrusted with the task of periodic restocking of designated waters with young fry. In some instances, notably those of many Chesapeake Bay oyster beds, methods have been adopted which virtually constitute a process of sowing and reaping.

The deep sea fisheries, as distinguished from river, lake and coastwise fishing, have played a role of great significance in international commercial, political and scientific development. Geography owes much to the fisheries. In their

constant search for more prolific waters fishermen have been responsible for many feats of discovery and exploration. Mediaeval Norsemen may well have resorted to the Newfoundland Banks; and the names of many South Sea islands still bear witness to the far flung voyages of the American whalers. Sea power too has leaned heavily upon fishermen for support. Fishing fleets have always contributed strategic manpower to merchant and naval vessels in times of emergency and have often been transformed into auxiliary navies.

Because the fisheries happily combined the three virtues of promoting trade, affording employment for labor and capital and providing a nursery for seamen they have seldom lacked warm advocates amongst those responsible for national policies. Queen Elizabeth added a second fast day to the week for the express purpose of stimulating the industry. Mercantilism looked with favor upon fisheries and provided numerous bounties on catches, exports and tonnage. For some centuries many branches of the industry, notably in Holland and in England, were carried on under conditions of quasi-monopoly, with the necessary corollaries of a government brand and regulation or prohibition of import; and not until the latter half of the nineteenth century did this system finally give way to *laissez faire*. But even today all countries engaged in fishing support government departments devoted to furthering the interests of the industry by regulation of fishing in territorial waters and by commercial services as well as by scientific research and collection of statistics.

The organization of the fishing industry has varied greatly in different times, but its nature has resulted in certain characteristic forms of operation. Fishing communities the world over exhibit marked similarities. With but few exceptions they have acquired a reputation for stubborn conservatism and provincialism, religious devotion and superstition, as well as for independence, courage, self-sacrifice and endurance. Grimsby, Aberdeen, Gloucester, Boulogne, Vigo, Ijmuiden, Bergen and the other great fishing ports of the world have been known as well for the poverty of their fishermen. In all countries and times low average earnings have resulted from the loss of boats and of gear and from the economic risks inherent in the vagaries of catches and of prices.

This uncertainty as to the outcome of the catch has been partly responsible for the development among fishermen of the characteristic

share system of wage payment. Subject to endless variety of detail and running the whole gamut from simple partnership to a complicated scheme of guaranteed wages, percentages of the net or gross catch and bonuses minus advances and deductions, the share system has been practically universal. It reached its greatest degree of elaboration, perhaps, in the "lay" of the American whaling industry, when a "green hand" often shipped for a share of one two-hundredth of the net proceeds of the voyage. Since a voyage commonly extended over a period of two to four years and since no wages were paid during this time, it was necessary to make numerous advances both in cash and in kind. These advances, in addition to interest charges and other deductions, drew so heavily upon the man's share, calculated at the end of the voyage, that he was not infrequently left with a purely nominal or even a negative balance.

With the advent of the steam trawler and its accompanying equipment and heavy capital outlay, however, the ocean fisheries are falling more and more into the hands of larger owners who pay definite wages, often adding a percentage for the master and incentive bonuses for the crew rather than shares. Trade unionism too is gaining headway, sometimes at the expense of the credit, cooperative and philanthropic societies, which were more appropriate, perhaps, to the small scale industry that is gradually passing away. But in the coastal, lake and river fisheries with their less expensive boats and gear the share system still continues.

Increasing concentration of ownership and enlarged scale of operations are also accompanied by changes in the commercial organization of the industry. Throughout the nineteenth century it was common for the small share owners to sell their catches (at auction, by sample, or on board) to merchants who in turn delivered them to the retailers. Subject to the modifications of growing mechanization and integration and in spite of countless variations in detail this triple organization of fisherman, merchant and retailer still prevails. But it is gradually yielding to competitive pressure from large firms which seek to bring under one management everything from the ownership and operation of their own fleet of vessels to the final sales in their own retail shops or at least through their chosen agents.

The interest of national governments in the protection of their fishing industries has often endangered international peace. Fishing rights

played a prominent part in the prolonged seventeenth century struggle between Holland and England; the two rivals came to blows repeatedly over the North Sea herring catch and the Spitsbergen whaling grounds. When Grotius propounded and Holland championed the doctrine of *mare liberum*, England under James I and Charles I replied with the concept of *mare clausum*. The question was finally settled so far as fishermen were concerned by the general (although not universal) acceptance of three nautical miles from low water mark as the limit of territorial jurisdiction.

Since the Napoleonic wars fisheries have led the way in the adoption of international conventions and arbitration to replace force in the settlement of controversies. Rival claims as to fishing rights on the Newfoundland Banks and as to the corollary right of entry to foreign harbors for shelter, repairs and the curing of catch have been settled by the French-British convention of 1904 and the North Atlantic Coast Fisheries Arbitration at The Hague in 1910. The latter award closed questions which had been irritants in the field of British-American relations since 1873. The status of Japan's valuable rights in Siberian waters is still the subject of dispute.

The pioneering North Sea Fisheries Convention of 1882 established a system of international police regulation which ended lawlessness on that important ground. The British-Danish Convention of 1901 covering the rich Iceland and Faroe Islands fisheries extended international police regulation and at the same time applied the principle of territorial waters so as to limit Danish jurisdiction and conservation measures to the three-mile zone.

Preservation of the Pribilof Islands seal herd was at the root of the famous Bering Sea controversy. Although the arbitration award of 1893 denied the right of the United States to enforce observance by Canadian boats of protective regulations except within the three-mile limit, Britain subsequently agreed to respect them. Japan, however, did not. It was only when extinction threatened the whole herd that Japan and Russia joined Britain and the United States in signing the protective convention of 1911. The United States-Canadian North Pacific Halibut conventions of 1923 and 1930 were a mutual attempt to preserve fish life by the establishment of a closed season.

These steps although encouraging are still inadequate. Improvements in the mechanics of

fishery craft and equipment, by hastening exhaustion of traditional fisheries and so spurring the search for new grounds, continue to increase the need for cooperative international action to preserve and regulate the fisheries of the world.

FISK, JAMES, JR. (1835-72), American financier. In the expanding American financial world of the 1860's Fisk was a genial, rotund, spectacular playboy devoid of affected dignity or moral scruples. During the Civil War he perfected a system for running cotton through the military lines. This did not prevent him, however, from subsequently becoming the comic opera colonel and financial angel of a regiment with a war record. Learning of the willingness

of certain parties to purchase a steamship line he commended himself to Daniel Drew, the would be vendor, by negotiating the transaction. Participation in the latter's bear operations in Erie quickly made him wealthy. Settlement of the Vanderbilt-Drew battle over the railroad in 1868 left Fisk and his permanent confederate, Jay Gould, in control. They were now employing the Drew technique effectively against its originator. Direction of the Erie was useful in other ways. The company took offices in Fisk's Grand Opera House in New York at a handsome rental. It refused railway facilities to competitors of a quarry in which he was interested. Its security issues during this period cannot be matched against betterments of the road. Association with Tammany assured Fisk the cooperation of the judiciary in his manipulations. In 1869 an effort to enlist the support of federal officials in cornering the gold market proved ineffective and the speculation collapsed. Fisk contributed nothing to the development of the American railway plant or system. An attempt to control the Albany and Susquehanna and thus to compete for New England traffic, carried out by a species of physical warfare among other means, was unsuccessful. Could his ready resource and commercial inventiveness conceivably have been disciplined, he might have done something of lasting value.

THOR HULTGREN

FISKE, JOHN (1842-1901), American philosopher and historian. Edmund Fiske Green, who after 1860 was known by his adopted name of John Fiske, was connected during most of his lifetime with Harvard University. He graduated from the college in 1863, from the law school in 1865 and from 1869 until his death served as lecturer, assistant librarian and overseer. During his earlier years Fiske's chief interest was in philosophy. His first work was a widely read critical analysis, in philosophical and historical terms, of Buckle's contributions toward a reinterpretation of history. Fiske was deeply influenced by the writings of Comte, Darwin and Spencer, and together with Edward Youmans, whose biography he wrote, devoted his best efforts to publicizing Spencerian evolutionism in America. His capacity for striking presentation both on paper and on the platform

and still more his skill in reconciling scientific hypothesis with the essentials of established religious faith brought him international recognition. His numerous philosophical writings came to be strongly marked by an irrepressible optimism, which rejoiced in the assurance of well regulated, purposeful unfoldings of evolutionary processes. This teleological tendency is evidenced most clearly in a series of lectures delivered in London (*American Political Ideas Viewed from the Standpoint of Universal History*, New York 1885), in which he skilfully deploys his broad knowledge of the past in defense of the thesis that Anglo-American institutions and civilization represent the ultimate goal foreseen since the beginning by an all wise Providence.

From 1879 to his death Fiske's chief work was in American history. His first study, *The Critical Period of American History, 1783-1789* (Boston 1888, 4th ed. 1889), gave a new emphasis to the years between the revolution and the adoption of the constitution. His studies led him backward and he gave great attention to the period of discovery (*Discovery of America*, 2 vols., Boston 1892) and to the formative first settlements, as in *The Beginnings of New England* (Boston 1889, new ed. 1930), *Old Virginia and Her Neighbors* (2 vols., Boston 1897) and *The Dutch and Quaker Colonies in America* (2 vols., Boston 1899). Although he was frequently concerned with formulating laws of history and establishing criteria for a science of history, his researches were those of a literary man rather than of a scientist. He lived, however, among a group of men who were laying the foundation for the present knowledge of American history.

Fiske's chief contributions were as a popular writer and lecturer. His wide culture, his lucidity of mind and literary style and his unique personality made him perhaps the chief American intermediary between the closet scholars and the intelligent public. While his popularity was in part due to his talent for the picturesque, he held his audience because among the philosophers and scientists of the day he most strongly represented the prevalent American ideal. He may be placed by considering that from the study of evolution he ran in exactly the opposite direction from his Harvard associate Henry Adams.

FISON, LORIMER (1832-1907), Australian anthropologist. Fison, born in Barningham, Suffolk, England, migrated to Australia in 1855. From 1863 to 1884 he served as a missionary in Fiji. His interest in anthropology was awakened by a circular letter which he received in 1869 from Lewis Henry Morgan soliciting information on kinship systems. With the collaboration of A. W. Howitt, whom he interested in the project, he published a pioneer work on Australian social organization, *Kamilaroi and Kurnai* (Melbourne 1880), to which Morgan wrote an introduction.

In the acrimonious controversy that was raging between McLennan and Morgan as to the meaning of kinship terms Fison supported the latter against McLennan's mistaken judgment that the terms were merely terms of address. He substantiated Morgan's view that exogamy was a rule of the gens against McLennan's theory that it was caused by female infanticide, which caused a scarcity of women, and Lubbock's theory of marriage by capture. Although he endorsed Morgan's hypothesis of the origin of the gens as a reformatory movement to prevent the intermarriage of kin, a view which elicited derisive criticisms from McLennan, Lubbock and Lang, he refused in spite of Morgan's urging to contend positively that promiscuity originally existed. He vigorously criticized the degradation theory, which held that the cultures of primitive men represented lapses from civilization, a theory which was being used by theologians in their attempt to discredit the concepts of the evolutionary ethnologists.

BERNHARD J. STERN

Consult: Stern, Bernhard J., "Selections from the Letters of Lorimer Fison and A. W. Howitt to Lewis Henry Morgan" in *American Anthropologist*, n.s., vol. xxxii (1930) 257-79, 419-53, and *Lewis Henry*

FITTING, HEINRICH HERMANN (1831-1918), German jurist. Fitting passed almost the whole of his academic career at Halle. His first endeavors were *gemeinrechtlich*, particularly upon questions of joint obligations. His dogmatic-historical studies began with his dissertation and ended with his *Das Castrense peculium in seiner geschichtlichen Entwicklung und heutigen gemeinrechtlichen Geltung* (Halle 1871). With the appearance of the German Code of Civil Procedure in 1877 he partially left historical fields and until 1890 devoted his best efforts to procedural studies. Notable results of these are *Der Reichs-Civilprozess* (Berlin 1878, 13th ed. 1907) and *Das Reichs-Konkursrecht und das Konkursverfahren* (Berlin 1881, 3rd ed. 1904). Fitting's fame, however, rests upon his research into the legal history of the early mediaeval period. Throughout the sixties he prepared himself for this work by a thorough mastery of the secondary literature. As late as 1866 he still was a follower of Savigny in denying any connecting link between Justinian and the glossators of the twelfth century, but Stintzing's continuity theory, the view that during this period legal science flourished and that a direct line of legal scholarship might be traced back from Irnerius to Justinian, later found in him an eager adherent. During the seventies and eighties he searched for direct references to legal science in this period and published his most important results, perhaps, in *Juristische Schriften des früheren Mittelalters* (Halle 1876) and *Die Anfänge der Rechtsschule zu Bologna* (Berlin 1888). Fitting's later efforts were attempts to show the extent of the glossators' utilization of earlier material. In editing the *Summa codicis des Irnerius* (Berlin 1894) and *Questiones de iuris subtilitatibus des Irnerius* (Berlin 1894) he thought he had established the continuity theory. In reality here, as in his conjectured pre-Bolognese sources, he had found only the typical popularizing works of the glossators. Mommsen, Conrat, Flach and Bremer early pointed out errors in Fitting's studies; Fitting did little for the continuity theory. Nevertheless, his mastery of the secondary literature and comprehensive knowledge of the sources make his works storehouses of information. Moreover, as Juncker says, he undoubtedly quickened interest in the legal history of

the early Middle Ages, and his errors were at least fruitful.

A. ARTHUR SCHILLER

Works: A list of Fitting's works to 1907 are to be found in *Mélanges Fitting*, 2 vols. (Paris 1907-08) vol. i, p. xvii-xx.

Consult: Juncker, J., in *Deutsches biographisches Jahrbuch*, vol. iv (Berlin 1929) p. 298-303.

FITZHERBERT, JOHN (died 1531), English agriculturist. Fitzherbert is now considered to be the father of English agricultural literature and the author of two books, both published in 1523, *The Boke of Husbandry* and *The Boke of Surveyeng and Improvmentes*. The first is a practical treatise on English farming, the second an exposition of the law of manors. The two works are the first books written and printed in English on English agriculture. Neither work reveals the name of the author, but the writer of the second definitely claims the authorship of the first. In his edition of the *Husbandry* (London 1534) Berthelet says that it was "compyled . . . by Mayster Fitzherbarde . . . after he had exercysed husbandry with greate experience XL years." Until the present century the authorship was claimed for a famous lawyer, Sir Anthony Fitzherbert (1470-1538), author of *La graunde abridgement* (London 1514) and of five other legal treatises. He and John were respectively the youngest and eldest sons of Ralph Fitzherbert of Norbury, Derbyshire. John Fitzherbert had for four years studied at the Inns of Court before he returned to Derbyshire to manage the estate which he inherited on his father's death in 1483. He thus possessed the legal knowledge necessary for the *Boke of Surveyeng* and by 1523 had gained exactly his forty years' experience of practical farming. Berthelet, moreover, implies that in 1534 the author was dead. This was true of John but not of Anthony, who lived until 1538. It seems more reasonable to assume that John had learned enough law to write on surveying than that a busy lawyer like Anthony had gained the practical experience to write on husbandry. On these grounds the British Museum catalogue now attributes the authorship of both works to John Fitzherbert.

The two books appeared at the beginning of the period of transition from common field farming to individual occupation. Fitzherbert, in the language of the day, strongly advocates "several" as opposed to "champion" land; he advises every man to take advantage of the legal facilities for withdrawal from the common farm by ar-

range between landlord and tenant and to "change fields with his neighbour so that he may lay his lands together," keep more livestock and rest and enrich his impoverished cornland. The *Boke of Husbandry* is in the form of a Farmer's Year, beginning with January. It reveals not only the conditions and difficulties of common field farming but the ideas of a progressive agriculturist. Few improvements are suggested in methods of cultivation or its implements. But Fitzherbert gets at the root of the matter when he urges that a full bullock yard and a full sheepfold make a full stackyard. No man, he says, can thrive by corn without livestock, and he who tries to keep stock without corn is either "a buyer, a beggar, or a borrower." Although he did not foresee the extension of pasture by the break up of common arable farms he did anticipate developments which were rendered possible by the supply of new sources of winter keep for stock. Shrewd, far seeing and humorous, Fitzherbert wrote of what he knew of farming after forty years' experience. Had his golden rule been followed, the literature of which he was the parent might have been less copious.

ERNLE

Works: The best edition of *The Boke of Husbandry* is that by W. W. Skeat, English Dialect Society Publications, vol. xxxvii, ser. D, misc. (London 1882), who supports the claim of Sir Anthony Fitzherbert to the authorship of the work.

Consult: Fitzherbert, Reginald H. C., "The Authorship of the Book of Husbandry and the Book of Surveying" in *English Historical Review*, vol. xii (1897) 225-36; Gay, Edwin F., "The Authorship of the *Book of Husbandry* and the *Book of Surveying*" in *Quarterly Journal of Economics*, vol. xviii (1903-04) 588-93; Ernle, Lord (Prothero, R. E.), *English Farming, Past and Present* (4th ed. London 1927) p. 90-97; McDonald, Donald, *Agricultural Writers from Sir Walter of Henley to Arthur Young, 1200-1800* (London 1908) p. 13-23.

FITZHUGH, GEORGE (1807-81), American social and political theorist. A lawyer by profession, Fitzhugh practised at the bar during the greater part of his life. For a short period he was also a judge in the local Virginia courts and during Buchanan's administration he served in the federal attorney general's department. His real importance is to be found, however, in his writings, which reveal him as probably the outstanding theorist among the surprisingly large group of southerners who in the two decades preceding the Civil War attempted to justify the existing order in the South in the light of social and political philosophy. In *Sociology for the South*;

or, *the Failure of Free Society* (Richmond 1854) and *Cannibals All! or, Slaves without Masters* (Richmond 1857) as well as in numerous articles in *DeBow's Review* and other periodicals he defended the institution and principle of slavery in such fashion as to carry the war into the enemy's country. Identifying political economy with the doctrine of laissez faire he attacked always vigorously and often extravagantly the economists and their concept of a free society built on the foundations of liberty, freedom of contract and freedom of competition. He asserted that not liberty but a strong benevolent government is the proper function of the political order. The experience of history and especially of southern history shows that only a few men succeed in independent careers. The only workable organization of society therefore is one which provides a method by which the unsuccessful will be cared for and protected in accordance with their needs rather than their capital. The manifold evils of a free society, which have aroused the increasing protests of the socialists, can be eliminated only by a return to slavery, "the oldest, the best and the most common form of socialism." As elements in a practical program for improving conditions in the South Fitzhugh advocated an extension of public education, diversification of industry and a protective tariff as stimuli to economic independence.

FLACH, JACQUES (1846-1919), French historian. Flach was born in Strasbourg. There he studied law and practised; but when Alsace was separated from France after the Franco-Prussian War, he left his native land and settled in Paris, where he attended the École des Chartes and the École des Hautes Études. He taught comparative law at the Collège de France and comparative civil law in the École des Sciences Politiques. He made studies of the history of the agrarian regime in Ireland from its inception until the present, the code of Hammurabi, the political and private institutions of Hungary, those of Russia and Japan and the primitive institutions of the tribes of America, Africa and Oceania. His most important work is *Les origines de l'ancienne France*

(4 vols., Paris 1886-1917). This work is especially important for the study of the rise of the great local states of France and their share in the development of the French nationality. Flach's main thesis is that early France was not a feudal state and that the royal power was but partially a development of territorial feudalism. The relationship of the princes to the early Capetian monarchs was one not of feudal vassalage but of personal allegiance. Although this work was influential in modifying historical opinion on many important issues, its conclusions cannot be accepted without reserve. Flach's ardent French patriotism is revealed in his refutation of the thesis that attributed the regeneration of Gaul to the Germanic invasions.

FLACIUS, MATTHIAS. *See* MAGDEBURG CENTURIATORS.

FLAX, HEMP AND JUTE. These three fibers belong to the group of plant stalk, or bast, fibers. In contrast with cotton, which is a seed fiber, and abacá and henequen, which are leaf fibers, they are found in the skin of the plant stem. They are removed from the woody core of the stem and from the surrounding gummy pulp by retting, or submersion in water, a difficult and disagreeable process that has been instrumental in limiting their production to regions of abundant and cheap labor. Flax is used in the manufacture of linen, cloth of jute (gunny cloth) makes the bagging and the baling for the grain and cotton crops of the world, and hemp is a material for the manufacture of cordage.

Flax and hemp were probably among the first vegetable fibers to be used by man. Certainly they were the most widely distributed in prehistoric and early historic times, for they are much less exacting in their climatic demands than the other fibers. Flax is grown from the cold northern plains of Russia to the valley of the Nile, and hemp throughout the middle latitudes. The predominant position of flax and hemp continued down to the opening of the nineteenth century, when the invention of the cotton gin greatly cheapened the production of cotton; the flax served as the fiber for fine clothing and hemp,

strong and dependable, outfitted sailing vessels and entered into more ordinary cloth. Jute demands a tropical climate and until recently its use was limited to India.

Flax was used by the lake dwellers of the earliest stone age, and in the ruins of some of their habitations in Switzerland it has been found in every stage of preparation from the straw to cloth of good quality. Of the people of historic times the Egyptians were probably the first to produce a linen cloth of fine texture. There is no record of the earliest introduction of flax into Egypt, but the discoveries at Badari made in 1924-25 indicate that it was cultivated by the Badarins, whose period has been placed by Sir Flinders Petrie at between 10,000 and 13,000 B.C. and by other authorities at 5000 B.C. These people wore clothing of goat skins, but some of their garments were of linen. Linen was used by the ancient Egyptians both for clothing and for the wrappings of the dead. In the biography of Methen, who belonged in the third dynasty (2980-2900 B.C.), and perhaps the earliest biography extant, mention is made of his appointment as overseer of all flax of the king. In the description of the preparation of the flax fiber in Egypt given by Pliny the process is almost identical with that which prevails today. Flax continued to be an important crop in Egypt for many centuries and until the fourteenth century Egypt was the leading contributor of flax to world trade.

Hemp seems to have originated somewhere in western or central Asia and wild hemp is still to be found growing along the lower Ural and the Volga rivers, near the Caspian Sea and in Persia, the Altai mountains and northern and western China. At a very early period the cultivation of the plant spread eastward to China and Japan, southward to India and westward to the Mediterranean lands. As early as the twenty-seventh century B.C. hemp was cultivated in China for fiber, and garments of hemp clothed the great majority of the people. Before the introduction of cotton into Japan in the ninth century A.D. hemp was the cloth of the poorer classes. Herodotus states that hemp was cultivated in Thrace and that it was used not only for ropes but for fine cloth. Reference is also made to its use by Babylonians, Persians, Egyptians, Hebrews and Chaldeans. An early important use was for sails and ropes of ships, the word canvas being derived from the Arabic name for hemp. The Romans apparently consumed much hemp. It was used in their ships; their laws and annals were sometimes written on hempen cloth; it adorned

their theaters and covered their streets and public places. It was even used for the making of table linen.

Flax growing in the British Isles probably dates back to the Roman occupation. It is thought to have been introduced into Ireland by the Norman settlers in the thirteenth century and there it became the basis of a hand industry, which did not become important, however, until the advent of the Huguenot refugees in 1685 with the spinning wheel and other improvements in manufacture making possible a product much superior to the earlier coarse and narrow cloth. Hemp was also grown in the British Isles, especially in the lowlands of the east coast of England, in Lincolnshire, Suffolk and Holderness and in Ireland. It was used in the ropewalks of the coastal cities, in which were made the rope and rigging for British naval and merchant vessels and for the fishing industry. The cultivation of hemp in the British Isles has disappeared.

The British government early began to encourage the growing of flax. In 1532 an act of Parliament compelled all persons holding tillage land to sow at least one rood (a quarter of an acre) with flax for every sixty acres occupied. Thirty years later a penalty of £5 was imposed on persons not growing at least one acre of flax for every sixty acres of land cultivated. In 1691 the tithe on flax was reduced to four shillings per acre and in 1712 a bounty of one penny per ell (a length of about forty-five inches) was given on all exported sailcloth of British manufacture. These measures were intended more for the encouragement of manufacturing industries in the British Isles and for insuring necessary supplies for British ships than they were for any expansion of agriculture, since bounties were also paid on the importation of flax and hemp from the colonies. During the mercantilist period of the middle eighteenth century there was considerable agitation for the encouragement of the production of flax and hemp, among other raw materials, in the British colonies.

Both flax and hemp were of some importance in the American colonies. They were planted in the Plymouth colony and in Virginia and practically every farm had a field devoted to their cultivation. The fiber was retted, scutched, hackled and spun by the members of the farmer's household. By 1630 considerable quantities of flax were raised in Massachusetts. As early as 1662 a law was enacted in Virginia calling upon each poll district to raise annually and manufacture six pounds of linen thread. Before sheep had

been introduced in any number into the colonies and before the cultivation of cotton had become important, flax and hemp fibers were used by the settlers for their clothing. A French treatise written in the middle of the eighteenth century described hemp as the most important of all the products of the new settlements save bread corn, since it provided one half of the clothing for the winter season and practically all of it for the summer. Hemp was used for the rigging of ships. It was important in the New England fishing industry and the famous clipper ships of the first half of the nineteenth century were outfitted with ropes, cables, shrouds and sails of hemp fiber. The wagons that crossed the western plains before 1860 carried covers of hemp cloth. For a time hemp was cultivated in the blue grass region of Kentucky to supply the boat building industry of the Ohio River. But the two fibers were not suited to a region of scanty population and abundant resources. Their preparation was too exacting. As long as each farm and each small district was forced to be self-sufficient, the cultivation of hemp and flax could continue, but with the opening up of trade it was impossible to compete with lands of denser population and cheaper labor. Imported hemp and flax products and cotton fiber supplanted the locally produced supplies and the land was turned to other crops that were more profitable and more pleasant to cultivate. Only a small amount of hemp, retted by the dew process, is now produced in Kentucky, Illinois and Wisconsin. Between 3,000,000 and 4,000,000 acres of land in the United States are in flax, but the plant is cultivated not for the fiber but for the seed. Indeed, at the present time a far greater quantity of flax is planted for seed than for fiber. In 1924 the world acreage of flax was about 19,000,000 acres, of which 1,000,000 acres were harvested for fiber. The largest producers of flaxseed, or linseed, oil are Argentina, Russia and the United States (see PAINTS AND VARNISHES).

The efforts to encourage the production of flax in the British Isles and in the colonies continued into the nineteenth century. In 1806 a bounty was offered for the importation of the fiber from the British possessions and every effort was made to increase the output of the fiber at home. In 1851 a very strong movement was under way to encourage an expansion of flax cultivation in Ireland. It was supported by the press, the Royal Agricultural Society of England and the Board of Trade, but the factors unfavorable to cultivation proved too strong. Although

agriculture was in a serious position and although it was probably true that a slightly greater return might be obtained from flax than from wheat, the difference was not sufficient to compensate for the exacting labor that was demanded in preparing the fiber for market. The straw had first to be submerged in water to free the fiber from the gummy pulp that held it together and the fermenting putrid bundles had to be spread upon the ground to dry before breaking and separating out the woody core. In addition, the flax plant is exacting in its care, is somewhat sensitive to climatic conditions and in Ireland is an uncertain crop because of the excessive rainfall. With the final abolition of the corn laws in 1856 the attempts to stimulate artificially the cultivation of agricultural products in the British Isles came to an end.

Following the Treaty of Paris of the same year and the conclusion of peace with Russia large quantities of cheap Russian fiber came into the British market. Since that time Ireland has never been able to meet the competition of Russia, for the Russian flax can be delivered in Ireland more cheaply than the Irish farmer can produce it. There was a brief revival of the industry between 1860 and 1870, a result mainly of the shortage of cotton during the American Civil War. In 1870 the area in flax had increased to 24,000 acres, but bad seasons about 1875 and the high prices of wheat caused many farmers to turn from the cultivation of flax. There has been some recovery in recent years and between 1909 and 1914 the area averaged 53,000 acres, but in 1930 it had declined to about 32,000 acres, an area of no importance in comparison with the more than 4,000,000 acres in flax in Russia.

Russia now occupies the dominant position in flax production, contributing some 60 percent of the world's total. An additional 18 percent comes from former Russian territory now included in Poland and the new states of the Baltic. This region of the northwestern part of the European plain has the advantage of very cheap labor, since the population is dense in relation to the agricultural possibilities, which are limited by a glacial topography, poor drainage and a sandy soil. In this region the straw is retted without submersion by spreading it out thinly on the ground, the so-called dew process. The resulting fiber is not of the best quality but when mixed with better grades it makes a satisfactory cloth. Along the river Lys in Belgium, especially at Courtrai, a flax fiber famous for its quality is produced. The waters of the river possess some

property that gives to the flax a remarkable fineness and a spinning quality that is unequaled. Japan is the only country outside of Europe that is important in the cultivation of flax for fiber.

The manufacture of linen as a hand industry was important in Ireland from the middle of the seventeenth century. In 1720, 240,000 yards of linen cloth were exported; in 1800, 25,000,000 yards; and in 1821, 44,000,000 yards, all spun and woven by hand. About the same time that the revolutionary inventions were taking place in the cotton industry, similar developments were occurring in the manufacture of linen. In 1787 flax spinning machinery was invented by John Kendrew and Thomas Porthouse at Darlington, England, and spinning frames driven first by water power and later by steam power were adopted in England and Scotland. These early mills were operated on a dry spinning principle suitable only for the coarser yarns. In 1828, three years after the perfection of the wet spinning process for superior yarns, the first power spinning mill was erected in Ireland at Belfast. The weaving continued to be done on hand looms until 1850, when eighty-eight power looms began operation. They displaced the hand looms slowly and even at the present time many

of the hand looms are in use. In 1841 Ireland had 250,000 flax spindles. The number has now increased to approximately 1,000,000. Linen is manufactured also in France, Belgium, Germany, Czechoslovakia, Russia and Japan, but Belfast is the center both for quantity and quality. The British Isles now have about one third of the world's flax spindles and most of them are located in northern Ireland. About two thirds of the Irish output of linen is exported.

Undoubtedly the greatest blow to the flax and linen industry occurred in 1793 with the invention of Eli Whitney's cotton gin. The new machine greatly reduced the cost of separating the cotton seed from the fiber. Flax and hemp, previously the vegetable fibers of major importance, were quickly supplanted by the cheaper cotton, which became the staple clothing material of the world. An invention that would replace with a machine process the present costly and unpleasant hand retting of flax would bring about a revolution in the linen industry as far reaching and complete as that produced in cotton manufacture by the cotton gin.

Many disagreeable features are found in the manufacturing processes as well as in the retting of the flax. In the mill the roughing, hackling and sorting of the flax preparatory to spinning give off a fine dust which has an injurious effect upon the lungs of the workers. At one time British recruiting officers were forbidden to enlist for the army men who had worked in flax mills. Flax because of the smooth, straight and inelastic character of the fiber cannot be spun on mules, and ring frames have been discarded because of the dirt and water. The flyer system is used, and for fine yarns the fiber is passed through troughs of heated water just before it reaches the spindles. In the spinning room of a flax mill the air is very humid and water is thrown from the spindles upon the floor and upon the workers. In the British Isles and in France and Belgium and some other linen manufacturing countries stringent laws have been enacted for dust removal and for protecting the workers from water.

Hemp as a fiber for the weaving of cloth was supplanted by cotton soon after the invention of the gin, not only because the cotton can be prepared more easily and more cheaply but also because it can be spun more easily and with less waste and produces a smoother and more uniform yarn. For a time hemp was important in the making of rope and cordage, but it is now being replaced in marine uses by abacá, or

Manila hemp, and in uses such as binder twine, where great strength is not essential, by sisal hemp and henequen. Abacá has the advantage of being lighter than the real hemp. It will float in water and it is resistant to injury from salt water without being tarred. Hemp fiber is still used in the twines with which the ends of the larger ropes are bound. A small amount is made into cloth in China, Korea and India. Some is raised in Japan for local use in fish nets and mosquito netting. The important world producers of the fiber are Russia and Italy, the two countries contributing 75 percent of the world output. The hemp fiber is used in the United States mainly for the manufacture of twine for a number of specialized purposes where strength is necessary.

Abacá, sisal, henequen, ixtle, New Zealand hemp, are all fibers found in the leaves of plants and must be removed by stripping and scraping or decortication. With the exception of some recent attempts to introduce machinery in the preparation of the abacá in the Philippine Islands all of these fibers are prepared by hand. The world's supply of abacá comes from the Philippine Islands, although a small quantity is also produced in Java. Henequen is the product of the dry limestone peninsula of Yucatan and New Zealand hemp is grown in New Zealand, the Azores, St. Helena and Scotland. Sisal comes from Java, East Africa and the Bahamas, and ixtle from the central basins of Mexico. China

grass, or ramie, is a most important textile plant of China. It produces one of the strongest and finest fibers known. The fiber is prepared in China almost entirely by hand. A machine or chemical process of preparation would undoubtedly make China grass one of the leading textile fibers of the world.

Jute, first brought to Europe and North America from India about a century ago, is now used more than all other vegetable fibers combined, excluding cotton. It is the cheapest, the weakest, the most perishable, the least lustrous and the most easily spun of any of the bast fibers. It has replaced hemp in many temporary uses, such as covering for cotton bales and bags for grain, coffee and sugar, and its great use has come with the expansion of world trade in those products.

Some jute is grown in Indo-China, Japan, Formosa, Siam and southern China, but about 99 percent of the world's jute crop is grown in India—in Bengal, Assam and Cooch Behar and a variety of jute known as *binlipatam* in Madras. The average world production of jute fiber for the years from 1909 to 1913 was 15,316,000 quintals, of which 15,280,624 quintals were raised in British India; for the year 1929 the world total was 17,680,000 quintals and the production of India 17,630,233 quintals. Efforts have been made to grow jute in southern United States, Egypt and other parts of Africa, but the yields have been stunted and the cost of extracting the fiber is prohibitive. The peculiar alluvial soil and warm climate from upper Orissa through eastern and northern Bengal seem to provide the best conditions for raising jute, and the dense population of this area provides the labor necessary for the preparation of the fiber for manufacture. No mechanical device has been perfected for releasing the fiber from the gummy part of the husk after it has been steeped, or retted, in water. The Bengali ryot performs this operation by hand, working waist deep in water to accomplish it. The dried fiber is boated or carted to the nearest rural market. There it is sold to local middlemen, who dispose of it to merchants in Calcutta. The mills rarely purchase their raw jute direct from the producer. In Calcutta the jute is sorted and graded for domestic mill use and for export. Under such methods of merchandising, where the units of production and distribution are so small, the major problem of the trade is the practise of watering the jute for added weight. The natural percentage of moisture in sound jute is about 8 percent, but

the dishonest ryot or petty middleman can add to his wealth by watering his stock of fiber, for detection is very difficult.

Jute spinning was extensively practised in India centuries before the British occupation. It was a hand industry and a most important domestic occupation for the populous eastern districts of lower Bengal. The yarn was used for cordage and lines, bedding, garments for the poor, matting and screens.

Jute as a world fiber became important between 1835 and 1838 through the perfection of machinery for softening the fiber and various other mechanical improvements for working it up. The Dundee flax spinners were responsible for introducing the fiber to world trade and held a monopoly in jute manufacture that was broken only by the introduction of jute machinery into India in 1855 and the growth of the large scale mill industry there. By 1894 the Indian industry was a strong competitor for world markets, and at the present time Calcutta far surpasses Dundee in quantity of output. With competition the Dundee manufacturers have turned to specialties, to dyed and bleached jute and its use in rugs, towels, upholstery and as a foundation for linoleums. Germany is also an important consumer of raw jute, rivaling the United Kingdom in quantity of imports; but the bulk of jute manufacturing is now done along the Hooghly River near Calcutta. India has over 1,000,000 jute spindles and more than 50,000 looms for hessian and sacking.

In spite of its success the Indian mill industry has suffered many setbacks, due very largely to excessively rapid growth. During the World War it operated at full capacity, but since that period it has been almost continuously under some form of voluntary agreement for production curtailment. Faulty forecasting of the jute crop by government officials has been another important cause of difficulty for the industry. In 1921 the forecast underestimated the crop about 80 percent, and in 1923 by 27 percent. This has resulted in famine prices for raw jute in the early part of the season with heavy losses to the mills when the actual crop becomes apparent.

FLEETWOOD, WILLIAM (1656-1723), English divine, antiquary and publicist. Educated at Cambridge, Fleetwood entered the church and became bishop of Ely. The rise of prices engaged his attention, as it did that of other clergymen, because of the losses suffered from the compounding of tithes. In *A Sermon against Clipping* (London 1694) he expressed his belief that half a crown in 1248 was "equal to Twelve or Fourteen Shillings now." After more careful examination he published *Chronicon preciosum* (London 1707; new ed. 1745, with an appendix by another hand), in which he reviewed the history of English coinage, and collected prices of corn, meat, drink and cloth, along with wages and stipends, ranging over six centuries. His purpose was to inquire whether one possessing six pounds per annum could conscientiously accept a fellowship restricted to possessors of less than five pounds by a statute made about 1450, "upon presumption that vi l., now is not worth what v l. was" then. He decided affirmatively, not so much because five pounds then contained 40 ounces of silver and now only 19½, as because the prices of each of the commodities investigated had risen about sixfold, on the ground

that "the value of a pound is truly a pound." This was, perhaps, the first attempt to measure variation in the purchasing power of money by the variations of prices. He averaged the prices of individual articles over twenty years in each of the two periods compared; and getting the prices of all to vary nearly alike, he escaped the problems of averaging the variations and of weighting the quantities, which trouble the makers of index numbers today. These considerations did not come up until some fifty years later.

Consult: Biographical preface by William Powell to his edition of Fleetwood's collected works (London 1838); Gras, N. S. B., "The Rise and Development of Economic History" in *Economic History Review*, vol. i (1927-28) 12-34; Clapham, J. H., *The Study of Economic History* (Cambridge, Eng. 1929) p. 11-13.

FLEMING, SIR SANDFORD (1827-1915), Canadian engineer and publicist. Fleming, who was born in Scotland and came to Canada as a youth, played a notable part in the development of lines of communication in his adopted country. In 1852 he joined the staff and soon became chief engineer of the Northern Railway, then under construction from Toronto to Collingwood and one of the first railway lines to be built in Canada. In 1863 he was chosen by the three provincial governments of Canada, New Brunswick and Nova Scotia and by the imperial government to conduct the surveys for the line which was projected to unite the British North American colonies. He remained in charge of this work, the Intercolonial Railway, until the line was completed in 1876; in the course of construction he vigorously opposed the award of extravagant contracts to political favorites.

Fleming recognized the importance of railways in the economic and political development of Canada, and he was one of the earliest and most active advocates of a transcontinental railway. When the new dominion government decided upon construction of the Canadian Pacific Railway, Fleming in 1871 was appointed chief engineer. It was under his direction that the almost unknown country north of Lake Superior, across the prairies and through the mountains of British Columbia was surveyed for a practicable line of railway. After the surveys were complete the government turned over the enterprise to a private syndicate and Fleming retired.

After 1880 Fleming took little part in active engineering work and devoted himself to ad-

vancing various projects which he had at heart. The chief of these was the government owned Pacific cable from Canada to Australia; he persuaded the dominion and imperial governments to cooperate in the project as a means of promoting imperial unity. He was an imperialist, was prominently identified with the Imperial Federation League and participated as one of the Canadian representatives in the first two colonial conferences of 1887 and 1894. Another achievement with which his name is prominently associated is the adoption of "standard time," after an intensive struggle against local and national prejudices. Fleming is notable as an engineer who spent the greater part of his life in official or voluntary public service and who combined vision with practical persistence in converting dreams into realities.

FLEURY, ANDRE HERCULE DE (1653-1743), French cardinal and statesman. Through the patronage of Pietro Bonzi, a clever and influential Florentine diplomat in the service of the Bourbons, Fleury received an appointment in 1679, not many years after his graduation from the Jesuit Collège de Clermont, as almoner to the queen and upon her death in 1683 was given the same office under Louis XIV. He profited by observing his patron and rapidly developed into a genial man of the world, well received in all circles and discreetly paving his way to fortune by pleasing every one and offending no one. Because Louis believed he detected, in spite of Fleury's probity, a deficiency of ecclesiastical temperament, it was not until 1698 that he was given a bishopric, that of Fréjus in Provence. The will of Louis XIV, appointing him preceptor to the dauphin, gave him opportunity to establish a lasting influence over Louis XV. For a while after the conclusion of Louis' minority in 1723 he thought it prudent to dissimulate his power behind the shadow of the duke of Bourbon. But in 1726 he secured the dismissal of the bungling duke and at the age of seventy-three was himself invested with full control of the kingdom. Although he cleverly declined the title of first minister and his elevation to the cardinalate was the only official sign of his new position, the unwavering confidence of the king, sustained in the face of incessant court intrigue, made his

counsel prevail in France until its single costly defeat in the last year of his life.

Most historians since Saint-Simon have agreed with Fleury's political adversaries in censuring the peace policy which he founded upon the alliance with Robert Walpole as senile and unworthy of the youthful heir of a great king. Voltaire, however, did him justice. After the long wars by which Louis XIV had exhausted France the years of peace under Fleury enabled her to balance her budgets, to achieve commercial prosperity by developing her Indian and Canadian colonies and thus to recover her strength. His policy toward the Jansenists, one of bloodless persecution, superficially timorous but in reality manifesting the unobtrusive consistency characteristic of Fleury, was justified by the same fundamental concern for public tranquility and order as a condition of internal integration. Drawn into the War of the Polish Succession he not only succeeded, to a certain extent, in confining its course but extracted from the Treaty of Vienna (1738) at its close the completion of national unification through a clause sanctioning the reversion to France of the duchy of Lorraine. In order to defend the commerce and colonies of France and Spain after English ambitions had become emancipated from Walpole's pacific influence Fleury was preparing to make an alliance with Austria when French tradition, more powerful than his prudence, swept Louis XV in 1741 into the War of the Austrian Succession. So good a judge as Frederick II, "the young prince who had started the dance, leaving it to the king of France to pay the piper," thus vindicated Fleury's position: "He raised up France again and healed her. His countrymen owe their success to his skillful negotiations."

Consult: Verlaque, V., *Histoire du cardinal de Fleury et de son administration* (Palmé 1879); Vaucher, Paul, *Robert Walpole et la politique de Fleury (1731-1742)* (Paris 1924); Bourgeois, Émile, *Manuel historique de politique étrangère*, vols. i-iii (4th ed. Paris 1902-19) vol. i, p. 475-98; Voltaire, F. A., *Siècle de Louis XV* (new ed. Paris 1870), especially p. 20-24; Hardy, G., *Le cardinal de Fleury et le mouvement janséniste* (Paris 1925).

FLINT, ROBERT (1838-1910), Scotch theologian and philosopher of history. Flint was the son of humble parents; he was able to prepare himself for the ministry, whence he entered into chairs of divinity at St. Andrews and Edinburgh successively. In addition to his many writings

concerned with theistic sociology he has left *The Philosophy of History in Europe, France and Germany* (Edinburgh 1874), of which the part on France was subsequently expanded into *A History of the Philosophy of History* (Edinburgh 1893); *Vico* (Edinburgh 1884); *Socialism* (London 1894, 2nd ed. 1908).

Preoccupation with the work of his chair and even more an extreme conscientiousness about committing himself to print before he had examined all material available have left his work on the philosophy of history a fragment. Flint deliberately refuses to define "philosophy of history." He starts with "a notion quite general, even although vague," that human affairs have not been abandoned to caprice, to chaos, but exhibit somehow the reign of law. But he warns against the error of a "too definite or rather too narrow view of law and order; one drawn from physical science alone," and insists that moral laws cannot be brought under physical laws. In one sense he finds human curiosity from the very first concerned with the problem of the development of the human race. But in a stricter sense the philosophy of history begins with the Renaissance—perhaps with Bodin—since this philosophy involves three primary notions not adequately worked out until that period. They are the notion of development or evolution, that of human unity and that of liberty. He postpones the full explanation of his own philosophy of history as hinted at in these three notions for later and unfortunately unwritten volumes. Flint concerns himself in his published work not only with professional philosophers of history like Hegel and Cousin but also with practising historians like Voltaire and Michelet. He is no mere summarizer but a critic. His critical canons are substantially those of traditional British empiricism, with which his firmly held theism does not in the least conflict. The quality of his mind as well as his ethical standards reminds one of his countryman Adam Smith. Flint has temperamentally no sympathy for such transcendentalists as Hegel; yet his treatment of them is notably fair. He has left no grand system; but his work is painstaking, sensible, lighted with ideas and by no means outlived. His very refusal to set up a system of his own as a prolegomenon, which to Morley was a weakness, may well be one of the reasons for his vitality.

FLOOD, HENRY (1732-91), Irish statesman and orator. Flood's political career began at a time when the Irish people were in a state of apathy and the Irish legislature was in complete subjection to England. In the sixteen years succeeding his entrance into the Irish Parliament in 1759 he built up a strong parliamentary opposition to English domination and became the recognized leader of reform. In 1775, however, for reasons variously interpreted, he accepted office as vice treasurer of Ireland with a seat in the Privy Council. This move, which seemed to his party an act of treachery, robbed him of public confidence; and when he left his position in the government in 1780 he was for a time without influence or friends in the Irish Parliament.

He had given his support to the free trade measures of 1779, and in 1782 he cooperated with Grattan in securing the repeal of the Declaratory Act, an achievement which represented the first landmark of Irish independence. Not satisfied with this, Flood contended that Irish independence was not secure until England had formally renounced the right to legislate in addition to repealing the act which defined that right. Public opinion and the recently organized volunteer army supported Flood, and his success in securing the Renunciation Act from England restored to him a great deal of his former popularity. Flood was strongly opposed to any reduction or dissolution of the volunteers, and it was with their support, gathered in a convention in Dublin, that he brought to the legislature in 1783 his bill for parliamentary reform. Although his measure still excluded Catholics from the franchise it represented an admirable solution of the abuses then existing in Parliament. It was defeated, however, on the ground that it proceeded from an armed body, although the failure of subsequent reform bills, after the volunteers had disbanded, seemed to indicate that the cause of failure was not unrelated to the conditions which the measures attempted to remedy. In the same year Flood entered the English Parliament, although he retained his seat in the legislature of Ireland. He did not, however, achieve success or prestige in the former, and his activity in the latter rapidly declined after his defeat on the question of reform.

Flood as an orator combined emotion with

logic, invective with reason, political theory with a broad constitutional knowledge. As a statesman he was exceedingly effective in stating and popularizing the political needs of Ireland, although his reputation has suffered from the ambiguity of his motives. Unquestionably, however, his missteps resulted from personal ambition, jealousy and faulty judgment rather than from any lack of patriotic devotion.

FLOODS AND FLOOD CONTROL. The land surface of the earth is in a state of continual change: it is slowly being elevated by geological forces and as slowly and inevitably being eroded and leveled by the action of water. Water falls as rain or snow, a large portion of which runs off the land as rivulets and creeks, which later unite to form large rivers. On higher elevations the river cuts a deep channel which is more than capable of caring for the maximum flow of water, as, for example, the Grand Canyon of the Colorado River. When the river reaches the lowlands it becomes sluggish and meanders over wide areas, so that its channel is not deep enough to take care of the maximum flow of water. Consequently, when heavy rains or snows occur on the watershed of the river, floods inevitably must occur in the lowlands of the valley. Floods of this type are largely seasonal and have occurred and are apt to recur whenever the rainy season begins on the lowlands of such large rivers as the Mississippi, the Hwang Ho or Yellow River, the Ganges, the Rhine and the Nile.

Other floods may be caused by inundations of the seas, such as those which have repeatedly taken toll of Holland. An inundation caused the disastrous Bengal flood of 1876, in which 200,000 lives were lost; and the Philippine flood of 1911, which killed 850 people. Floods also occur because of the breaking of dams constructed for impounding water or as a result of so-called cloudbursts. The Johnstown, Pennsylvania, flood of 1889 was preceded by torrential rains which caused a break in the dam above Johnstown on the Conemaugh River; cloudbursts caused the Constantinople flood in 1913 and the Wellton, Arizona, flood in 1931.

Occasionally floods are beneficent, as in the valley of the Nile. Heavy tropical rains occur on the headwaters of the Nile River in April and May, causing the river to rise often as much as three feet per day. The resulting flood invariably reaches a maximum at Aswan early in September. For over seven thousand years the flood waters, rich in fertilizing material, have been diverted by a series of canals so as to flood the whole Nile valley, where they are held for a period of forty-five days and then drained back into the river. Egyptian agriculture is entirely dependent on the certainty of this flood condition.

The case of the Nile is exceptional. Floods are a calamity from which no continent or people is immune. Since the beginning of history China has been afflicted by floods, becoming progressively worse in their destructive effects. In 1887 a flood on the Hwang Ho, known as the "Sorrow of China," killed millions of people; 100,000 persons lost their lives in the 1911 flood on the Yangtze River. There were severe floods in mediaeval Europe; and in the past hundred years Europe has experienced a dozen disastrous floods, some of which extended from Belgium to the Adriatic. The rising of the Seine in 1910 flooded Paris, killing a large number of people and destroying property valued at \$200,000,000.

In the United States the most persistent flood problem is that of the Mississippi River. Since the alluvial valley of the Mississippi has been formed by the flood waters carrying the silt from the higher elevations, floods must have always occurred there. From 1785 to 1930 there were thirty major floods, the destructive effects of which were progressively aggravated by the increasing density of settlement. In 1912 there occurred the greatest flood then recorded, followed by one still greater in 1913. The flood which occurred in 1927 was the greatest in the history of the Mississippi. It began with the abundant rains of August and September, 1926, which maintained the water of the Mississippi above normal for the season. The torrential rains on the watershed of tributaries of the Ohio in December increased further the volume of water. Early in 1927 there were rains over the entire watershed sufficient to maintain the rise already obtained on the Mississippi. The heavy rains of March and April were so far above normal and the volume of water was so enormous that the water completely overflowed all of the protecting banks, levees and dikes of the

lower valley, causing one of the most disastrous floods on the American continent. The flood covered 18,268,780 acres of land, of which 4,417,500 were crop lands, and submerged the homes of 750,000 people. About 700,000 people were rendered destitute and were dependent on the American Red Cross and other relief agencies for shelter, food and medical attention. Property damage amounted to nearly \$300,000,000, of which over a third was in crops, livestock and farm property.

The persistent and catastrophic nature of floods early led to efforts at their control. There is little new, except as to magnitude, in modern methods of flood control, which include the construction of levees, spillways and reservoirs, reforestation, terracing cultivated soil and the creation of flood ways to care for the river at flood time. The Chinese, as early as 2000 B.C., built levees and drainage canals, combining flood control, land protection and irrigation. Flood ways have been used by the Egyptians for thousands of years. Recently discovered ruins of terraces in South America antedate the Inca civilization. During the Middle Ages levees were constructed on the Po, Danube, Rhine, Rhone and Volga rivers, supplemented in modern times by reforestation and storage reservoirs.

Levees have been the most favored method of flood control. Since the water of a river runs more slowly near its edge than in the center it naturally deposits its silt and mud to form banks. The banks of the river in a low valley therefore are higher at the river's edge and slope away from it. The inhabitants of a region adjacent to a river menaced by floods early sought to protect their homes, property and lives by strengthening these banks, making them higher and stronger. The theory is that if these levees are constructed high and strong enough they will confine the river and cause it to construct, by scouring, a channel deep enough to care for the maximum flow of the river at flood time. For forty centuries the Chinese have been trying to control the Hwang Ho in this manner, constructing higher and higher levees. But the river bed does not scour: it rises a foot a century until today the bottom of the river, confined by levees, is twenty feet above the surrounding country. When the levees break as they do in time of flood, the terror, suffering and desolation on the lower plains are inconceivable. Experience indicates that levees must be supplemented by other means of flood control.

The establishment of reservoirs on the head-

waters of the various streams which make the main river would be of immeasurable value in holding back flood waters and lowering their crest. But many experts consider the construction costs prohibitive; it is estimated that Boulder Dam on the Colorado River, which is the only feasible way of controlling the flood waters of this stream, will cost \$165,000,000. Reservoirs have proved their value in the Miami valley. They can also be used for irrigation, water supply storage and the control of navigation.

Another method of control is the construction of spillways and flood ways to divert and accommodate the flood waters. Advocates of flood ways would widen the river at certain points to permit and cause it to spill over and flood a confined portion of the surrounding country which would be deliberately sacrificed to protect the remainder. But here again opponents consider the costs prohibitive.

Reforestation and improved soil management are vital problems of flood prevention and control. Floods occurred on the Mississippi River long before white men settled in its valley or had removed the protecting tree and sod cover of the timbered watershed or sod bound prairie. Yet it is true that the accepted method of crop production on the uplands by breaking up the sod and producing only cultivated crops promotes soil erosion and decreases the water holding power of the soil. The same thing is true when the primeval forest is destroyed and the protecting vegetation thus removed. Soil erosion under these conditions takes place more rapidly. More water escapes to the river, especially where swamps are drained, and the soil debris is deposited in the river channel in the lowlands, thus increasing the damage from floods. The Chinese cut down forests and cultivated the soil on the upper reaches of rivers, and when the rains came the soils washed away; hundreds of square miles of land once farmed are now a desolate waste which produces neither forest, grass nor food and increases the menace of floods. These man made conditions aggravate the menace of floods, and they must be considered in any program of adequate flood control. Reforestation and improved soil management are important also because of their pronounced influence on the state of agriculture and lumbering.

Flood control in the United States is hampered by lack of centralized control due to constitutional limitations and to sectionalism.

Although the Mississippi valley is the drainage basin for thirty-one states, the problem and burden of flood control, up to 1879, was left to a few. After 1879 the federal government, under the fiction of improving navigation on the Mississippi, paid one third and later two thirds of the cost of levee construction. The national government's authority is neither complete nor clearly defined. Legislation varies in the different states and there is serious conflict of authority owing to the many different bodies participating in levee construction and other methods of flood control. There is no adequate federal water power code for the development, control and conservation of rivers.

Legislation for the construction of levees on the Mississippi was adopted by Congress in 1928; its costs are to be borne exclusively by the federal government. This program, for which \$325,000,000 is appropriated, officially sanctions the theory, adopted by the Mississippi River Commission soon after its formation in 1879, that "levees only" will solve the problem of flood control, although further surveys are authorized of the feasibility of constructing flood ways, spillways or diversion channels. There is no recognition in the law of 1928 of the possibility of lessening the damage from floods by adopting a national policy of reforestation, improved soil management to prevent erosion, and restoration of some of the bottom lands to their original condition as carriers of flood waters.

Adequate flood control is a vast and complicated undertaking. It encounters obstacles in the wide divergence of opinion on methods prevailing among recognized authorities. Taxpayers object to increased government expenditures. Reservoirs, flood ways and the restoration of swamps are opposed because they render useless enormous tracts of arable land. Timber owners destroy forests and farmers plant the most profitable crops regardless of the danger of soil erosion and floods. Adequate flood control depends in the last analysis upon a proper adjustment and combination of the different methods into a comprehensive program. The cost would be heavy, but so is the cumulative cost of flood disasters.

FLÓREZ ESTRADA, ALVARO (1765-1854), Spanish economist. After studying law Flórez Estrada entered the government service and in 1798 was appointed attorney general of Asturias. In this position he distinguished himself by his active opposition to Napoleon. In 1813 he was made chief justice of Seville. Because of his revolutionary activities he had to leave Spain several times and spend long periods of exile in London and Paris. He was elected corresponding member of the Académie des Sciences Morales et Politiques in 1851.

In his *Examen imparcial de las disensiones de América y medios de conciliación* (Madrid 1814) Flórez Estrada criticized Spain's vicious and antiquated system of colonial government, which estranged the colonies from the mother country, and strongly advocated the adoption of a less oppressive system. The period of his second exile was characterized by his greatest literary activity. During it he published the pamphlets *Efectos producidos en Europa por la baja en el producto de las minas de plata* (London 1824; English translation 1826), *Examen de la crisis comercial de la Inglaterra en 1826* (Paris 1827, 3rd ed. London 1828) and his leading work *Curso de economía política* (2 vols., London 1828; 6th ed. Madrid 1848), the first systematic treatise on economics written by a Spaniard. This work was based principally upon the theories of Adam Smith and the English economists contemporary with Flórez Estrada. Although he defended commercial freedom and advocated the abolition of customs duties he admitted the expediency of export duties in certain cases. He supported Malthus' theory of population and Ricardo's theory of rent. His most original doctrine was that private ownership of land was an unjust privilege to which should be ascribed "the laborer's failure to obtain the entire fruit of his labor." Anticipating John Stuart Mill and

Henry George he was one of the first to defend on economic grounds the common right to land. To this subject Flórez Estrada devoted his *La cuestión social; origen, latitud y efectos del derecho de propiedad* (Madrid 1839), which proposed the gradual socialization of land through the purchase by the state of the real estate offered for sale. The state was to derive its funds for these purchases from the proceeds of a special tax. Flórez Estrada's analysis of taxes and their effects, especially those that fall upon land, is one of the most interesting parts of his work. He considered that a tax on rent is the most just and convenient tax but he did not favor making it the sole one, nor did he advocate direct taxes exclusively. He was opposed to the policy of paying current expenses by government loans.

Flórez Estrada had considerable influence upon the development of the science of economics in Spain. His works were published in many editions and translations and won the respect of his contemporaries. His most original ideas, however, found no echo in his own country.

GERMÁN BERNÁCER

Consult: Heckel, Max von, "Zur Entwicklung und Lage der neueren staatswissenschaftlichen Literatur in Spanien" in *Jahrbücher für Nationalökonomie und Statistik*, n.s., vol. xxi (1890) 26-49.

FLORIDABLANCA, CONDE DE, JOSÉ MOÑINO Y REDONDO (1728-1808), Spanish statesman. Moñino studied law at the University of Orihuela and soon became interested in political and economic questions. In 1766 he was appointed fiscal to the Council of Castile and as such issued in collaboration with Campomanes the well known *Respuesta fiscal—contra los ganaderos trashumantes* (Madrid 1770), which protested against the grazing privileges of the *mesta* as a menace to Spanish agriculture. He was sent as ambassador to Pope Clement XIV to negotiate for the suppression of the Jesuit order. In 1773 he was raised to the nobility and from 1777 to 1792 was prime minister of Spain.

Floridablanca was strongly influenced by the French *philosophes* and economists, and his ministry was marked by a series of far reaching reforms, most of which are summed up in his *Representación hecha al Sr. Rey D. Carlos III* (Madrid 1829). Through his efforts a uniform system of import duties was established throughout Spain and a number of regulations which hampered industry and trade were suppressed. The alcabala, which weighed most heavily upon

the circulation of merchandise, was lowered and in certain instances done away with entirely. The trade with America was expanded and internal communication improved by the building of roads. Floridablanca also succeeded in abating the activities of the Algerian pirates who harassed the eastern coasts of Spain and in establishing commercial and friendly treaties with various countries, including Turkey. With the cooperation of Cabarrus he established in 1782 the first Spanish bank of issue, the Banco de San Carlos.

He aided the improvement of agriculture by modifying the traditional pasturage rights of the *mesta* and by limiting entails through the provision that new ones could be created only by royal license. He undertook vast irrigation projects, fostered agricultural and technical education and encouraged manual labor. Believing that only the state could organize charity efficiently and economically, he attempted to abolish vagrancy and beggary by a system of public beneficence supported by special taxation.

Floridablanca was a skilful diplomat who favored peace and understood the politics of his time thoroughly. He increased the international prestige of Spain and contributed effectively to the formation of the armed neutrality directed against England. In his relations with the papacy he was an uncompromising supporter of royal authority. Some of his works have been published in Biblioteca de Autores Españoles series (vol. lix).

FOLK HIGH SCHOOLS (Folks Højskole).

The folk high school is a distinctive type of educational institution for adults, indigenous to Denmark, which within the last two or three decades has taken root in Sweden and Finland and more recently has been copied in America and to some extent in Germany, although the German *Volkshochschule* is generally a very different sort of institution despite its similar name. These schools grew out of a national need. Denmark had been ruined politically, economically and morally by the Napoleonic wars. At the mercy of tyrannical landlords the peasant farmers had become poverty stricken and mo-

rose. The churches housed a formal and decadent "Christianity" which attracted nobody; the schools including the university were centers of an irrelevant classicism.

The history of the folk high school goes back to an educational project proposed in 1832 by Nicolai S. F. Grundtvig, a liberal theologian and social philosopher, who had been banned from the pulpit. Grundtvig had dug deep into the old Norse cultures, had felt the rising tide of science, had made the acquaintance of such educational reformers as Rousseau, Pestalozzi and Fröbel, with their emphasis upon the participation of the individual in his own education, and had discovered, as he himself said, "what the Englishman calls freedom." In 1832 in the preface to a book on Norse mythology he proposed to wipe out the decadent and irrelevant cultures of the churches and existing schools and replace them with the old folk cultures of the Danes, thus restoring the nation's morale, and with the new applied sciences, thus creating a nation of technicians and restoring its economic position. To do this new schools were needed in which personal growth could be stimulated and in which a social life might develop out of individual freedom. A new Denmark must be brought into being by means of a new education.

The first of these schools he set up in 1844, but Grundtvig was no practical school man and the project failed. In 1851 Kristen Kold, who had found teaching in the formal state schools intolerable, established the first successful folk high school. After 1865 the number of such schools increased rapidly, and by 1885 there were more than a hundred of them. In 1930 there were sixty with an enrolment of 7000 students, almost half of whom were women. A few have been organized by the so-called "inner mission" religious movement in small cities and very recently the socialists have set up several in the larger cities, but on the whole they remain village and countryside institutions. Of the approximately eighty schools now existing about sixty are rural.

Leaving academic learning to the Latin schools and the university, the folk high schools try to discover the occupational, sex, social and spiritual interests of each individual and to release, clarify and integrate them. Grundtvig regarded the realization of such a process as the only true form of education; learning he considered secondary. The curriculum covers four or five fundamental areas: the wealth of northern culture, especially that of Denmark; world

history; the life of the modern community, especially its social and economic aspects; and the great cultural meanings of life expressed in literature and modern science. There is no attempt to teach facts; the object is only to develop interests and suggest meanings. Education is primarily through conversation, the "living word." There are no recitations, assigned lessons, examinations, grades, credits, diplomas or other academic gestures. Lectures are intended to stimulate reading without assigning it as a command.

The schools are small communities containing about a hundred students and four or five teachers with their families. The students live in the school. There is a five-month session for men in the winter and a three-month session for women in the summer. This separation is based partly on economic needs, partly on the pedagogical theory that it would otherwise interfere with the development of an intensive intellectual life in the students.

The schools are privately owned and controlled in many cases by the teachers, in some by religious organizations. In general, those owned by the teachers do the best work. The state recognizes the schools and grants some financial aid either by supplementing teachers' salaries or by subsidizing needy students, without attempting political control. At present, it is said, the state subvention makes it possible for every Dane to attend a school.

The only qualification for admission to most of these schools is that the pupil be eighteen years old. Most of the students finish elementary school at about fourteen, spend the next four years working in the home and on the farm and then go to a folk high school for a term or two. Since about 30 percent of the adult population goes through these schools, Denmark has the best educated village and rural population in the world. This fact is intimately related to the intensive development of farmers' cooperatives and an agricultural political party which in coalition with the urban Social Democrats has largely dominated the state in recent years, as well as to the growth of a liberal wing of the state church, the so-called Grundtvigians.

Denmark, however, cannot escape the effects of world wide economic forces which in recent years have upset national prosperity. For example, unemployment in Great Britain, by seriously contracting the market for Danish foodstuffs, has embarrassed the cooperative associations and given support to critics of cooperative education. In addition, international move-

ments such as the International Peoples' College at Elsinore have won wide support, putting the nationalist folk high schools on the defensive. Whatever their fate is to be, however, the high schools have contributed to pedagogy some realistic lessons in the profounder meanings of education.

The Danish folk high schools were brought to America (notably to Nebraska, Iowa and Minnesota) by Danish immigrants in the seventies and eighties of the last century. They were consistently ignored by American educators who, regarding them from the American academic point of view, found nothing significant in them. Later, American educators became aware of the distinctive nature of these schools and within the past decade have realized their possible values. That realization has resulted in a number of significant books on education and at least three schools modeled on the Danish plan: Pocono Peoples College at Henryville, Pennsylvania; the John C. Campbell Folk School at Brasstown, North Carolina; and Ashland College at Grant, Michigan.

There is a definite conflict between the American conception of education as something to be got at a school, to be taken on in units and measured in credits, to be passed and to be graduated from, and this Danish conception of education as something to be achieved during all the years of life and to be valued for its own sake. Hence there has been much discussion as to whether anything of the Danish type can take root in American life. It was assumed by the founders of the Pocono and the Campbell experiment that the distinctive thing about the Danish movement in Denmark was that the Danes are a homogeneous race and that therefore it would be best to begin similar work in America among a similarly homogeneous people. Hence both efforts were begun among the allegedly homogeneous racial groups of the eastern American mountain regions. The founders of the Ashland experiment, assuming that the distinctive thing about the Danish movement was the moral and intellectual contribution it made to the economic recovery of discouraged Denmark, began their work in the heart of agricultural Michigan. The greatest difficulty encountered in both Pennsylvania and North Carolina has been the precariousness of the local economic bases of existence; although the people may be easily stimulated to new moral and spiritual outlooks they lack secure economic foundations upon which to build a new civiliza-

tion. The greatest difficulty encountered in comparatively prosperous Michigan has been that little need of spiritual or intellectual nourishment beyond that furnished formally by the local schools is felt. Probably many experiments must be undertaken before the American folk high school learns how to meet American needs and avoid American pitfalls.

FOLKLORE. The term folklore was first used in the middle of the nineteenth century to denote folk traditions, festivals, songs and superstitions. Much of the anthropological material called folklore comes from rural populations of the civilized world. It is the field in which the culture of peasant Europe is most obviously similar to the cultural traits of primitive peoples and as such has been used since the time of Tylor to document the parallelisms of primitive and modern culture. More than any other body of material it makes vivid the recency and the precariousness of those rationalistic attitudes of the modern urban educated groups which are often identified with human nature. Two fields of inquiry have become differentiated: the study of popular superstitions, including proverbs, songs and popular sayings; and research connected with folk tales.

Superstitions among civilized peoples have been widely collected. The best known repository of peasant magic and festivals is Frazer's *Golden Bough*, although the author makes no attempt at systematic study. Some degree of order has been brought into the vast mass of available material by Hazlitt's dictionary (*Brand's Popular Antiquities . . . Faiths and Folklore*), the *Mitteilungen zur jüdischen Volkskunde* and especially the *Handwörterbuch des deutschen Aberglaubens*. The vast available heterogeneous material has, however, hardly been made the subject of sci-

entific analysis. Future studies will probably be made under the headings of specific subjects, such, for example, as folk songs, food tabus and magic.

The branch of folklore dealing with the traditional tales of primitive and modern peoples ranks among the important humanistic sciences. The history of the attempts to understand folk tales goes back far beyond the coining of the word folklore. Religious prophets, poets and philosophers from primitive times have been compelled to adopt some attitude toward the myths which incorporated the religious dogma of their times. Priestly reworking of myths is clearly seen in various primitive American Indian tribes, and, as Lang points out, the *Rigveda* left out the most glaring indecencies in the behavior of the gods and Homer avoided the worst scandals. Confucian and Buddhist scribes and the writers of both the Old and New Testaments allegorized or definitely made light of the myths that formed the body of the religious belief with which they were confronted. The early philosophers rationalized the myths of their times in accordance with their leading concepts. Aristotle used them as allegories of political philosophy and Porphyry of mystic experience.

Early modern scientific study of folk tales was motivated by a desire to find a rational explanation for their abhorrent and fantastic content. Max Müller proposed the theory, eagerly taken up by students of Aryan languages, that mythology was to be understood as a disease of language, a pathology of words. Lang, the most vigorous critic of the theory, showed that the myths occurred far beyond the regions inhabited by peoples of Aryan speech and that they could not be founded on the same allegories based upon puns on completely different proper names of gods and heroes. The great diversity in interpretation among Aryan students also helped to discredit the theory.

The Euhemerists, whose best known spokesmen were the abbé Banier and Lemprière, interpreted myth as fantasy concealing historical fact. Danaë's golden shower was said to represent the gold with which her guards were bribed; Daedalus' walking images were said to portray the fact that legs were just being separated in the contemporary sculpture instead of being modeled in one piece as in archaic sculpture. Jakob Grimm considered unnatural and extravagant incidents in secular household tales as degenerations of serious cosmic allegories in earlier religiously motivated mythology.

Folk High Schools — Folklore

The survival theory of Tylor and Lang was also an effort to explain away fantastic and abhorrent elements. They believed that myths arose in savage society and remained comparatively unchanged as survivals in higher and later civilizations. However unintelligible a tale appeared in its present setting, all its incidents were thought to have been originally in keeping with the ethos of the people who invented them. This theory was supported by the obvious survivals of feudal customs in Grimm's tales, survivals which are due to the fact that European folklore is not living. The theory of survivals assumes too great a stability in culture traits, for the importance of survivals naturally decreases as one deals with a still functioning mythology. Tylor, for example, speaks of South American myths as containing reference to the polar sun of the arctic regions through which the South American peoples presumably passed in remote ages, and Lang would apparently have us believe that the myth of Cronus survives from a primitive stage in which fathers were accustomed to eat their children. Studies of the myths of primitive peoples who have established themselves in different culture areas within the past hundred years, however, reveal that myths change much more rapidly than either language or physical type.

The nature symbolists, who have dominated German mythological studies and continue to dominate the field of the mediaeval romances, have in common the dogma that all mythology reproduces the phenomena of nature under hidden figures of speech. The death and rebirth of the hero is interpreted, for example, as a parable of the succession of winter and summer; the warriors' combat with arrows as the shooting of the sun's rays; the tremendous bulk of test themes, in which the hero submits to and conquers in tests set by his prospective father-in-law or uncle, as dramatizations of the sun's progress through the underworld before it is permitted to rise again at dawn. Such sun allegories are made the basis of mythology by Seler, Ehrenreich and Preuss; a similar role has been claimed for fog by Laistner and for the moon by Siecke, and more generalized theories of nature symbolism include as well allegories of the seasons and of storm. It is not held that the tales are considered allegories by their present tellers, but they are thought to have so originated. Careful studies in folklore, such as Ehrenreich's collection of New World mythology, have been inspired by this theory. Its popularity may per-

haps be explained by the fact that late Greek mythology is compact with nature allegories and also by the fact that the study of myth in the nineteenth century coincided with a great romantic revival of the cult of nature. Once one questions the dogma that imagination expresses itself in myth only by allegory, it is difficult to see why tales of fights between the hero and the dragon are intelligible only as they are explained by the phenomena of sunset or other natural phenomena. Human war and marriage and birth and death are themselves capable of suggesting tales. Lowie has further shown that the complex of traits which Ehrenreich posits as solar symbolism is definitely unstable and that the crucial symbols are often lacking in any given version. This fact and doubt concerning the validity of the major premise of the nature symbolists, that a fixed symbolism exists without reference to the culture or associations of the people among whom a tale is current, have caused modern realistic students of primitive mythology to abandon the nature symbolism theory. It is recognized, however, that sometimes native story tellers have made their own allegories of their tales and have given them nature symbolism, as when an American Indian or Siberian tribe has developed a cycle of star myths or of storm myths.

Psychoanalysts also interpret folklore in terms of allegory. Instead, however, of seeing in the myths cosmic phenomena hidden under fixed symbolism they see physiological and especially sex processes so portrayed. Fixed symbolism according to which one reads fire as the sex act, water as birth, whetstones, knives and serpents as the male organs is a gratuitous interpretation in cases where the symbolism of the region has not been studied. Snakes, for example, are the prime symbol of immortality over large parts of the world because snakes rejuvenate themselves by casting off their skins, and it is untenable to interpret snakes in the mythologies of such regions as phallic. The psychoanalytic school has further weakened its position by adopting the familiar and sex situation of urban twentieth century western civilization as the standard of reference in all primitive mythologies, interpreting them in the light of Oedipus fixations, castration complexes and the inhibitions and displacements consequent on the particular sex tabus of modern western society. They commit the serious methodological error of interpreting myths as representing the father-son conflict in a matrilineal society where the father is shorn

of all authority, which is instead vested in a person outside the biological family, usually the mother's brother. Symbolists, whether they find in myth nature or sex symbolism or prognostications of the future, as in certain schools of Biblical exegesis, have failed to realize the cogency of the criticism made by Tylor that mere possibility is worthless in mythological speculation.

Certain scholars regard myths as primarily etiological. According to this view man desired to explain the material world in terms of the human and animal world and therefore sought narrative forms under which to interpret the processes of nature and of culture. The explanatory conclusions of many tales are held to be the most significant and dynamically important mythological elements and it is believed that these are the sources of the tales. The etiological motivation is sometimes deduced from tales although it has not been specifically formulated in the telling. Dähnhardt was especially interested in the etiological use of tales, rather than in their etiological origin. Rivers argued that man would naturally be driven to explain the more unfamiliar or insecure aspects of his environment and that hence the comparative recency and historical background of those aspects of social life which his myths explain could be learned therefrom. The primary hypothesis here involved, that myths are fundamentally explanations, is open to two thoroughgoing criticisms. One of these rests on the ground of its intellectualistic character, for emotional stress and fancy both play a role in folklore themes as well as does the intellect with its effort to seek explanations. A further criticism is that of Waterman, who in his examination of the "that's whys" of Indian folk tales shows that mythological plots are often very stable over wide distributions, but the facts that they are supposed to explain and from which they are supposed to have originated are the most unstable of all elements of the plots. He found ten different origins of animals, names or customs added by as many different tribes to the same tale; in as many more variants all mention of origins was absent. The explanatory elements therefore, far from being the source of the plot, are secondary and local associations.

The modern study of folklore stresses equally diffusion and acculturation, the study of the geographical distribution of tales and the absorption of local cultural material into tribal mythology. The importance of the study of diffusion in folklore was early recognized. Lang spoke of it as

the driftwood theory and collected widely dispersed examples of the Jason, or magic fleece, story, which is still one of the best available stories with which to document the importance of contacts of peoples in early times. The emphasis on the importance of diffusion led to two exaggerations: one school derived all myths from the Euphrates valley and the other derived all myths from India. The pan-Babylonian school, which was interested in showing eastern analogues to the Hebrew Old Testament tales, effectually refuted the dogma of the uniqueness of the Bible but has had little evidence with which to reinforce its position that all myths originated in the Euphrates region. The pan-Indians on the other hand have a strong case for their argument that world mythology can be traced to ancient India. Benfey and later Cosquin have demonstrated that Indian parallels of both animal and novelistic European tales are legion and that the oldest versions are found in the Orient. The genetic relationship of tales in Europe and in Asia is no longer questioned and, broadly speaking, all Eurasia and Africa may be considered as one culture area in regard to mythology. The criticism against the pan-Indians is that the fact that the oldest versions are recorded in Indian sacred literature does not prove India to be the place of origin of these tales. The study of contemporary preliterate peoples has shown that unwritten literature often maintains itself with remarkable stability, as, for example, in widely separated Eskimo tribes. The fact that the tales had been first written down in one area rather than in another, while significant in relation to the history of written literatures, does not settle the question of the region in which the tales were current earliest.

The distribution of myths has been studied for several other ends than that of proving the source of origin of mythology. Dixon has used it to determine movements of peoples. Frazer's works and Bolte and Polívka's concordance to Grimm's tales have been compiled without theoretical preoccupation. The modern Finnish school under the leadership of Aarne and Krohn, represented in the United States by Taylor and Thompson, have set themselves as their aim the reconstruction of the archetypal tale. Their thorough work is important because they have isolated the most stable and widely distributed elements of the tale in order to define the limits of investigation. The archetypal tale has been, however, in much of their writing a somewhat mystic abstraction, and their method a search

after fixed laws that they conceive to be necessary to give meaning to folklore study. Boas, in his concordance of the Indian tales of the North Pacific coast, analyzes mythology like any other culture trait to show its content over a considerable area and the kind of changes that may be expected—the breakdown and recombination of the elements of a tale as it passes from one people to another and the incorporation of cultural material.

The excessive stability of tales in European folklore, due partly to the fact that they are current within a single culture area very slightly differentiated and also to the illusion produced by the fact that a tremendous profusion of variants is known as compared with other mythologies, has prevented the understanding of the usual morphological behavior of folk tales. Folklore incidents combine and recombine with ease, attaching themselves now to one plot and now to another. In the process they are necessarily reconstructed to suit the new association that has been set up. Only by a study of their diffusion can it be determined which aspects of a tale are present because they are the traditional and common property of the entire area or even of a large part of the world, and which elements are the peculiar contribution of the people under discussion. Historical analysis must thus precede the psychological study of tales.

Among any people tales are individualized as a part of their adoption into the local culture and acculturated by the incorporation of cultural detail and by marked changes of motivation. The picture of their own daily life is incorporated in their tales with accuracy and detail. This is well illustrated by Boas in regard to the tales of the Tsimshian (*Tsimshian Mythology*, p. 393-477). Peoples' folk tales are in this sense their autobiography and the clearest mirror of their life. Not all elements of culture, however, are reflected and even important ones may be ignored because of local literary convention. In most of the world the culture reflected is roughly contemporaneous—not of a distant past, as has been argued on the basis of European folklore. When mythology is living and functioning even the most recent cultural innovations may be reflected in the tales.

Behavior and attitudes become more articulate in folklore than in any other cultural trait, and folklore then tends to crystallize and perpetuate the forms of culture that it has made articulate. This is true especially in regard to religion, which is largely unintelligible with-

out reference to sacred tales, often specifically designated mythology. The animistic attitude universal in religion expresses itself freely through the medium of tale making, giving embodiment to the spirits which religion postulates in the universe. These tales sometimes become the most stressed aspect of the local religious complex. Folklore plays a similar although less noticeable role in relation to other cultural traits such as etiquette, morals, avoidances and occupational pursuits. It crystallizes the forms that are locally favored or insisted upon, and gives therefore one of the important available sanctions to the mores of the group. The social acceptance or intolerance of the autocratic attitude, the behavior toward the poor, the treatment of the elder generation by the younger, and innumerable other points of ethics are in this way reenforced and perpetuated by the folklore of the group.

Modern folkloristic study is freeing itself of preconceptions and of far fetched allegories and is founding itself upon the importance of folklore as a social phenomenon and as a means of expression by a social group of its own attitudes and cultural life. By regarding folklore as a cultural trait like technology, social organization or religion any special consideration of communal authorship is made unnecessary, since myths are as much and as little due to communal creation as marriage or fertility rites. All cultural traits including folk tales are in the last analysis individual creations determined by cultural conditioning. They must, however, each be socially accepted, a process with which the individual has comparatively little to do and which is dependent upon the cumulative social traits and preoccupations of his group.

Folklore is literature and like any art it has traditional regional stylistic forms which may be studied like any other art forms. The elaboration of many African tales on a stylized framework of songs or on local proverbs, the device of the theme of the youngest of three sons in European folk tales and the frequent formalized repetition that is common almost everywhere are literary conventions. Folklore is an oral art and involves all the special arts of oral narration, only some of which survive reproduction on the printed page. The most complex mythological art form is the epic which is common to a large part of Eurasia and comprises many epic cycles. Strictly speaking the form is not known outside this region.

It is ironic that the academic study of folklore

should have labored throughout its course under the incubus of theories explaining seven-headed monsters and magic swords as survivals of primordial conditions, allegories of the sun and moon or of the sex act or etiological philosophizing and have ignored the unconfined role of the human imagination in the creation of mythology. Exaggeration is inherent in the play of imagination; distance and time are annihilated and natural phenomena personalized spontaneously without rationalistic background. The play of imagination, fundamental in folklore, is given direction by the great opportunity for wish fulfilment. More than in any other form of art there is the possibility of pleasurable identification and whatever is thought of as most desirable in personal experience in any region finds free expression. In hero tales as nowhere else man can indulge his desires without running the risk of consequences or flying in the face of possibility; thus the dead are brought to life, days are lengthened or shortened, the despised hero triumphs and pride goes before a fall. Since the wish fulfilments of different cultures vary, strongly contrasting myth cycles develop. The Hebrew mythology was cast in the form of history portraying the drama of the race in its role as the chosen people of God. In mediaeval Europe the peasant folk tales, the Grimm's collection, were motivated by naïve grandiose dreams of the success of the despised; those of the aristocrats, the *chansons de geste*, by the glory of hereditary lines in a society where chivalry was dominant; those of the growing urban proletariat, such as that of Reynard the Fox, by the dream of living by one's wits. In the same manner the themes of primitive mythologies incorporate dominant daydreams of the tribe or culture area.

The autobiographical character of folklore is preserved in present day mythologies in those regions where mythology is still a living cultural trait. The mockery of the priest in German folklore as contrasted with the ubiquitousness of the church background in Spanish tales, or the great number of episodic adventure stories, often picaresque, in Spain as compared with the overwhelming popularity of the love theme in Russia, reflect characteristic preoccupations. In those rural sections of North America where folklore is still found there are wide divergencies in the degree to which the customs and attitudes of the narrators are reflected in their tales. In some regions the tales are ossified and the traditional form is retained in the most

incongruous settings. This is especially true in Mexico, where mythology is filled with characters and appurtenances like lions, thrones and scepters, retained from the Spanish folklore that has quite superseded the older Indian mythologies. The same is true to a somewhat slighter extent of the folklore of the French Canadians and of the mountain whites of the Cumberlands. The latter have preserved, for instance, the old English ballad. The incongruity between the traditional forms of folklore and the cultural practises of the present day is less marked in Negro folklore and in the Paul Bunyan tales of the lumbermen. Negro folklore varies comparatively little wherever it is found in North America and in the West Indies. A considerable proportion of it seems to have received its present form in the New World, but it is all fundamentally related to West African mythologies which are in turn genetically related to European folk tales. However, all of it has been remodeled to serve as a vehicle for comment on the conditions that surrounded the Negro in his new environment. Brer Rabbit and Anansi are opportunities for slave comment and the Massa stories are often direct transcriptions of slave life. The one native American folklore is that of the lumbermen, the "tall tales" of Paul Bunyan or similar heroes. Here self-expression is at a maximum and historical analogues are almost non-existent. The tales are all extravagant exaggerations of exploit, a folk form that is common in America but which has nowhere except in the Paul Bunyan cycles become traditional folklore. These tales, said to have been current in the middle of the last century along the Susquehanna, are now found throughout lumbering centers in North America.

Except that folk tales still flourish in America in these few rural groups, folklore has not survived as a living trait in modern civilization. It has been perpetuated by the printed page, however, in the nursery through the fairy tale and the animal anecdote of European derivation and in the church, which perpetuates much Semitic mythology. Thus in a strict sense folklore is a dead trait in the modern world. All study of it from the point of view of furthering the understanding of present social forms, is in order to comprehend, from the one example available, the changes that occur when a culture trait ceases to follow a traditional mold and becomes an affair of individual responsibility and initiative. For while individual expression is still largely curtailed in other aspects of

culture, such as marriage and education, by an emphasis on the value of conformity to traditional standards, in literature, which throughout previous human history has been traditionally determined, individual creativeness is now indispensable for popular approval and plagiarism is a punishable offense. The study of folklore therefore makes more vivid than any other discipline the contrast between behavior as it finds expression under traditional cultural forms and as it finds expression as a manifestation of individual creativeness.

FOLKWAYS are group habits or customs. The word folkway was coined by W. G. Sumner (1840-1910) in order to give definiteness and tangibility to similar sociological concepts al-

ready in use, such as custom, social usage and tradition, and to avoid the set of vague connotations that cling about the more familiar terms. Folkways win traditional authority by becoming intertwined with cult practises and religious concepts. They become regulative for succeeding generations and assume the character of a social force controlling individual and social undertakings. They also belong to a system of social relations, conventions and institutional arrangements and in virtue of this characteristic constitute the leading factual material in the "science of society." To Sumner thus the study of the folkways "is for a science of society what the study of the cell is for biology" (*Science of Society*, vol. i, p. 31).

Folkways originate in the frequent repetition of petty acts, usually by a number of individuals acting in concert or at least acting similarly when faced with the same basic need. The simultaneous efforts of many to satisfy their personal interests produce mass phenomena, which are folkways by virtue of the uniformity and repetition they possess and the wide concurrence in them. The process of custom forming is thus similar to that of habit forming, and the same psychological laws are involved. Folkways tend to group themselves about the major interests looking toward the maintenance, protection and perpetuation of the individual and toward security and satisfaction in life. They are attended by pleasure or pain according to the measure in which they are adapted to these needs. They thus constitute a means of adjustment to life conditions, and the more expedient ways tend to survive.

The development of these group habits is largely unpremeditated or automatic, and they tend with time to become more and more arbitrary, positive and imperative. If primitive men are asked why they behave in a certain way in particular cases they usually answer that it is because they and their ancestors have always done so. Moreover, the ancestral ghosts would be angry if the living should deviate from the ancient ways. Despite this apparent rigidity the folkways nevertheless change to meet new conditions; innovations appear and practises that become inexpedient are discontinued. The folkways are also subject to a strain toward consistency with one another, for they answer their several purposes with less friction when they harmonize and cooperate.

"Use and wont" are as characteristic of modern as of primitive civilization. People ad-

just themselves to the telephone and the automobile through folkways as distinctive as those which clustered around the courier and the horse. The factory system has produced a body of folkways which distinguish the manufacturing town from the residential suburb or the agricultural village. Technological advances have altered the standards and habits of all classes. But despite changes in form the folkways still retain their essential character and authority in modern society.

Expediency by no means explains all folkways. There always resides in them a large element of force, and this may be directed by the ruling class or interested persons. They may likewise be due to accident, to false inference or to irrational and incongruous action based on a sort of pseudo-knowledge. On the Nicobar Islands, for example, some natives who had begun to make pottery died; from then on the art was given up. A Winnebago girl who had been expelled from her tribe for bobbing her hair was recalled when an epidemic followed; the new custom was then sanctioned. These cases illustrate the generally prevalent mode of reasoning of primitive people—*post hoc ergo propter hoc*. Traditional folkways that are gross, absurd or inexpedient may often be preserved by the process of conventionalization. Thus there may be nakedness without indecency and tales of adultery told without the stigma of lewdness.

When the conviction arises that certain folkways are indispensable to the welfare of society, that they are the only "right" ways and that departure from them will involve calamity, i.e. when philosophical and ethical generalizations are developed about them, they are called mores. Sumner borrowed the word with its implications from the Roman usage and defined it as "the popular habits and traditions, when they include a judgment that they are conducive to societal welfare, and when they exert a coercion on the individual to conform to them, although they are not coördinated by any authority" (*Science of Society*, vol. i, p. 34). The term, like folkways, has found its way into common usage. Mores differ from folkways not in kind but in degree. The removal of the hat when a man meets a woman on the street is a folkway, while the practise of monogamy belongs to the mores. Neglect of the former usage is not usually regarded as dangerous to society, although it is discreditable to the individual; but the latter is regarded as so valuable that in the supposed

interests of society the polygamist is promptly and severely repressed.

Morals are those mores which have become positive in dogma and which dominate on account of their importance, real or assumed. "The morality of a group at a time is the sum of the taboos and prescriptions in the folkways by which right conduct is defined. Therefore morals can never be intuitive. They are historical, institutional, and empirical" (*Folkways*, p. 29). Morals, like the mores in general, have their strongest hold in the masses, for the masses are ever conservative. The folkways are their ways because they constitute the supporting core of society.

Another important fact about the mores is to be found in their dominion over the individual. He is formed under their influence before he is capable of reasoning about them. Rules of action and standards of ethics set before him an ideal of the "man as he should be," and mold him by repeated suggestion in spite of himself and without his apparent knowledge. Only in so far as social rules have been transferred from the mores into laws and positive institutions are they to be viewed with any objectivity. It is always easiest to conform and the unconventional is penalized. Even the enlightened can free themselves only in a measure. The mores thus constitute an engine of social control. They regulate the political, social and religious behavior of the individual.

But the individual is not entirely powerless to influence the mores of his group, since he exercises a function of surpassing importance as a source of their variations. Slight departures from the code are always in evidence; indeed, the code of a society is merely a sort of average or mean about which cluster the codes of classes, sects and other larger and smaller subgroups. The individual not infrequently finds himself in involuntary antagonism to the mores of the society or the subgroup to which he belongs. When a man passes from one class to another, his behavior shows the contrast between the mores in which he was bred and those in which he finds himself. Satirists have ridiculed the parvenu for centuries. The mistakes and misfortunes of this class reveal the nature of the mores, their power over the individual, their pertinacity against later influences, the confusion in character produced by changing them and the grip of habit which appears both in the persistence of old mores and the weakness of new ones. The immigrant to be

assimilated must undergo an even more radical change of mores.

Tabus are negative mores—the thou shalt not's. They usually contain a greater element of philosophy than the simple positive injunctions, because they imply a rationalization such as, for instance, that the act would displease the ghosts. Tabus thus provide a means by which fear of the supernatural comes into play to prevent actions which are believed to be harmful to public health, industry, sex and family regulation, established religion or any other social interest. Often they are attenuated in more developed societies into a proscription of "bad form."

Laws are those folkways and mores which in addition to the uncoordinated approval of public opinion are given the added and specific sanction of the group as organized politically. That this is the fundamental nature of laws is seen by the countless cases throughout history of governments that have unsuccessfully attempted to establish as laws certain modes of behavior which had not already become fixed as group habits, i.e. which were not already folkways.

The mores form accretions about the nuclei of outstanding social interests, such as those of sex regulation or of worship, and, through selection, assume a definite and specific structure which takes the form of institutions such as the family and the church. As institutions take these definite forms and somewhat disengage themselves from the mass of custom they do not lose but carry with them that approval and that conviction as to their indispensability to social welfare which are accorded the mores in the first place.

Folkways are to be regarded as the units or elements of culture or civilization and by the same token all culture may be resolved into group habits. Customary modes of behavior and thought are obviously of this character. Folkways originate in "inventions" in the broader sense; these are adopted by the group and become thereby a part of its culture; they may then spread to other groups by diffusion. The concept of folkways differs from that of culture traits primarily with reference to material culture. Anthropologists use the term culture trait generally to designate a spear, a pot, an article of clothing, etc. as well as common habits of thought and behavior. Sociologists regard as the units of culture not such material objects themselves but rather the ways of mak-

ing and using them and the ideas entertained about them. These are group habits, and culture consists basically of habits carried in the nervous system of the individual. A culture area is a geographic region in which the various social groups possess a large proportion of their folkways in common.

From the fact that culture consists of folkways or group habits, i.e. habits shared by many individuals rather than possessed by one, culture is superindividual. Individual habits die with their possessors, but folkways or group habits live on in the survivors. The young in any society are initiated into the group habits of their elders, thus insuring the continuity of culture in spite of the impermanence of the individual. Habits so transmitted constitute the social heritage of a group.

Folkways and mores, laws and tabus, culture traits and customs, are specifically human phenomena. Only the most meager evidences of culture are discernible in non-human organisms. The so-called social insects, for example, do not possess culture in the sense that this is true of human societies. Animal behavior is innate in character rather than acquired, instinctive rather than habitual. The fact that culture is superindividual raises its phenomena to another plane, that of the "superorganic" of Herbert Spencer and A. L. Kroeber. To be sure, the superorganic rests on the organic, as the organic in turn rests on the inorganic, but the social phenomena of humans nevertheless belong to a different order, governed by distinctive laws and principles.

FONTANELLA, JUAN PEDRO (1576-1680), Spanish jurist. At an early age Fontanella became famous as a practising lawyer in Barcelona and as the author of *De pactis nuptialibus*. He

was also active in the nationalist movement and his name is connected with the organization of the Catalanian uprising against the Castilian troops of the Marquis de los Vélez. In 1651 he moved to Perpignan, where in addition to his work in law he continued his political activities and was made president of the council of the city.

Fontanella was one of the leading Spanish jurists of his time. In his writings he avoided the ineffectuality of the traditional commentaries and tried to make the law a vital force. *De pactis nuptialibus, sive capitulis matrimonialibus tractatus* (2 vols., Barcelona 1612) is a systematic discussion of all the legal problems connected with matrimony and a very shrewd exegesis of the different points in marriage articles and the legal questions to which their stipulations may give rise. In it Catalanian laws and customs are compared with those of other countries, frequently in terms of their social and historical implications. In 1639 and 1645 he published the two volumes of *Sacri regii senatus cathalonie decisiones*. His *Testamentum illustratum*, a study of testamentary succession as complete as his book on marriage articles, has unfortunately never been published.

The tendencies found in Fontanella's writings are representative of the Catalanian jurists of the seventeenth century. He manages, however, to avoid the narrow viewpoint which characterizes some of them and the exaggerated respect for the Roman law which marks others.

FONTENELLE, BERNARD LE BOVIER DE (1657-1757), French writer and *philosophe*. The versatile Fontenelle wrote no masterpiece and his important ideas are scattered through numerous works: *Dialogues des morts* (Paris 1683, last enlarged ed. Amsterdam 1710); *Digression sur les anciens et les modernes* (published together with *Poésies pastorales*, Paris 1688), in which he defended the moderns in the great dispute over the relative merits of ancient and modern literature; *Histoire des oracles* (Paris 1686, rev. ed. The Hague 1728); *De l'origine des fables* (published in 1724 ed. of *Entretiens*); *Entretiens sur la pluralité des mondes* (Paris 1686, last enlarged ed. 1724), a pioneer work in sci-

entific popularization in which he chatted very pleasantly to the social élite about the Copernican system; a history of the Académie des Sciences, of which he was perpetual secretary for sixty years; and vivid and just *Éloges* of members of the academy (first collected ed. Paris 1708; final ed., 2 vols., 1744). He was the most intelligent and discerning representative of that French philosophic spirit which became increasingly prevalent from about 1680 to 1740. A freethinker, believing neither in a revealed Christian religion nor in current moral standards, he considered many so-called virtues to be no more than "prejudices." He found it tempting to believe in nothing at all except an intelligent egoism, distrustful of men and entirely wrapped up in the quest of exquisite pleasures. But as time went on Fontenelle became more and more estranged from the pure Epicureans of his day, because for him the best pleasures were those of the intellect. From his skepticism there thus emerged a great confidence in the progress of the human reason. He thought that there were few reasonable men and doubted if there would ever be many. These few, however, had caused the human mind to make essential progress in the past; and now there was opening up before that mind the boundless vista of the experimental sciences, which were to overthrow mystical credulity and the systems of abstract philosophers. So far did Fontenelle carry his confidence in reason and in the methods of experimental science that, like many of his contemporaries, he would have submitted art and poetry to their canons.

DANIEL MORNET

FOOD AND DRUG REGULATION. Records of government efforts to prevent food and drug adulteration go back to antiquity. Both Athens and Rome made provision against the adulteration of wine. With the growth of the mediaeval towns there was a gradual transfer of certain forms of food manufacturing from the home to the artisan's shop. As bread baking, milling, wine and beer making and slaughtering

became recognized trades the government began to regulate them. In the reign of Edward the Confessor brewers were punished for bad work, and during the sixteenth century many English towns employed ale tasters. Beginning in 1203 the Assize of Bread regulated the price of the loaf and gradually clauses controlling adulteration of bread and other products were added, until the later acts, finally abrogated in 1836, acquired some of the character of a general law.

In 1316 the London pepperers, or spicers, began to regulate the quality of their produce, and the drug and grocery trades, which were one until 1617, followed the same practise. The College of Physicians was authorized to supervise apothecaries in 1540 and in 1553 and published the first pharmacopoeia in 1613. From the early eighteenth century onward special legislation, primarily to protect the revenue, controlled such articles as tea, coffee, chicory, beer and wine.

In France food control statutes were early enacted. In Paris that of 1292 forbade the adulteration of beer and that of 1330 the mixing and misrepresenting of wines. In 1708 Paris had 200 public wine inspectors. In 1382 millers were forbidden to mix foreign cereals or legumes with wheat; in 1420 bakers were forbidden to grind wheat, in order to make adulteration more difficult to accomplish. In 1396 Paris forbade the coloring of butter or the mixing of old butter with new. Henry II proceeded against the adulteration of saffron and Philip IV against that of drugs, spices and related products. The Paris Conseil de Salubrité, established in 1802, and later other departmental and municipal councils examined and reported on the quality of products and began to acquire jurisdiction over foods and drugs.

In Germany records of regulation go back to the thirteenth century. In 1532 Charles V attempted some imperial regulation, but control was exercised almost wholly by local authorities, the towns or the guilds. The dukes of Saxony regulated druggists as early as 1607. Frederick II of Prussia appointed drug inspectors. In the seventeenth century commissions of physicians supervised apothecaries and published pharmacopoeias.

In no country does a general law seem to have been enacted before the second half of the nineteenth century. Such laws would have been futile in the main, for until the invention of the microscope about 1590 and the development of

analytical chemistry the means of detecting more than a very few kinds of adulteration did not exist.

In 1820 Frederick C. Accum inaugurated a period of muckraking in England with *A Treatise on Adulteration of Food, and Culinary Poisons* (London). There followed an anonymous brochure, *Death in the Pot*, and finally Hassall's *Food and Its Adulterations* (London 1855), embodying the investigations of the Analytical Sanitary Commission organized by Wakley, the editor of the London *Lancet*. As a result general regulatory laws were enacted in 1860 and 1872. In 1874 there was established in London the Society of Public Analysts, which set up standards of food quality and purity. The Sale of Food and Drugs Act of 1875 with the Amendment of 1879, the Margarine Act of 1887, the Sale of Food and Drugs Act of 1899, the Butter and Margarine Act of 1907 and the Sale of Food and Drugs Act of 1927 form the existing English law.

In France from 1884 onward general and special laws were enacted. In Germany widespread outbreaks of trichinosis resulting from measly pork aroused public interest. The imperial health bureau (now the *Reichsgesundheitsamt*) was founded in 1876 and a general food law passed in 1879; it has since been widened to control margarine, filled cheese, edible fats, butter, wine and saccharin. In 1900 a new Meat Inspection Act was passed. The administration of these laws is aided by special research laboratories supported by government bodies, chambers of agriculture and universities; in 1921 there were about 120 such institutions. Between 1874 and 1921 Sweden, Austria, Switzerland, Denmark, Italy, Japan and Russia passed laws controlling food and drug trades largely along lines laid down in the German and English regulations. The laws are administered generally by health departments of central and local governments. Within this same period Portugal, Rumania and Spain issued royal ordinances designed to cope with the problem, but neither these countries nor Russia provided proper administrative or scientific apparatus to detect or prevent frauds.

Agricultural chemists under the leadership of Samuel W. Johnson paved the way for state food legislation in the United States by exposing adulteration in the fertilizer industry and led in the fight for further laws to curb adulteration of meat, kerosene, milk, feedstuffs, foods and drugs, paints, insecticides and fungicides. As a

result numerous state and federal laws against adulteration came to be administered by departments of agriculture or by agricultural experiment stations and colleges, with which such chemists were early connected.

The city boards of health established between 1850 and 1875 advocated and secured legislation regulating the quality and sale of meat and market milk. As a result of conflicts between cities, milk dealers and dairy farmers dairy associations were formed which succeeded in having state laws controlling dairy products enacted. In some states a dairy commissioner still supervises dairy products. The first general food law was passed in Illinois in 1874. In 1878 a joint committee of the principal scientific societies concerned with public health matters drew up a model law for New York. In 1879 the National Board of Trade recognized by resolution the need for food and drug legislation.

About this time the success of oleomargarine in competing with butter induced the well organized dairymen to secure remedial legislation in a number of states. In 1881 food and drug laws were enacted in New York and New Jersey, and in the ensuing twenty-five years most states enacted food laws. In 1871 general food inspection was begun in the District of Columbia and in 1888 Congress enacted a food and drug law for the District to be administered by the Bureau of Internal Revenue. In 1898 the District health officer was put in charge. Beginning in 1906 many states which had been without regulation laws until that time passed legislation similar to the federal laws; other states brought their laws into harmony with the federal statute. Boards of health enforce the laws in sixteen states, boards of agriculture in eleven, independent commissions in fifteen and agricultural experiment stations in four. In a few states there is no active enforcement.

The first national food adulteration law, the Oleomargarine Act of 1886, since repeatedly amended, was enacted after a hard struggle. In the following year the Division of Chemistry of the United States Department of Agriculture, then under the direction of Harvey W. Wiley, began issuing a bulletin on "Foods and Food Adulterants" (no. 13, 9 pts., 1887-1902). This and later supplements furnished ammunition in the struggle for legislation. In 1889 the Department of Agriculture was given its first appropriation to "extend and continue the investigation of the adulteration of food, drugs and liquors."

A United States Supreme Court decision of 1887 denied to the states the right to interfere with the shipment of original packages into the states and thus materially handicapped the enforcement of state laws. As early as 1879 European countries began to restrict the importation of meat animals from the United States because of pleuropneumonia and trichinosis and by 1888 eleven countries had prohibited the importation of pork products from the United States. In 1890 Congress passed a very general law relating to exported and imported foods and drugs. The administration of this law was placed in the hands of the secretary of agriculture, but no special provision was made for its enforcement.

In 1891 a not very effective meat inspection law was enacted. From 1890 to 1893 there was a bitter and unsuccessful fight in Congress over a bill analogous to the margarine law to curb the very prevalent adulteration of lard. In 1895 filled cheese was so heavily taxed that it was practically driven off the market, in 1897 the importation of tea was regulated and in 1898 mixed flour was heavily taxed.

In 1902 the Division of Chemistry (called the Bureau of Chemistry after 1901) of the Department of Agriculture was authorized in an appropriation bill to deny entry to adulterated or misbranded importations of food. Even wider powers were conferred upon the secretary of agriculture in the appropriation act for the fiscal year 1904. In 1902 Congress authorized the secretary of agriculture "to investigate the character of proposed food preservatives and coloring matters, and other substances added to foods, to determine their relation to digestion and to health, and to establish the principles which should guide their use." Under this authorization the so-called poison squad formed by Harvey W. Wiley investigated boric acid and borax, salicylic acid and its salts, benzoic acid and its salts, sulphur dioxide and sulphites, formaldehyde, copper sulphate and saltpeter.

In an appropriation act for 1903 the secretary of agriculture was authorized to establish standards for food products, but no means were provided to enforce such standards.

Most of the federal laws enacted up to this time had an economic motive. They either protected the farmer from competition or safeguarded the export trade in foodstuffs or both. Some dealt with imports and so had a protective or retaliatory effect as well. Domestic interests bitterly opposed federal control over the domestic food and drugs trades, and after the presen-

tation of the first bill to Congress in 1879 there ensued a struggle lasting more than twenty-five years. Special interests opposed federal legislation and many members of Congress and learned jurists questioned the constitutional right of Congress to legislate on the subject as well as the wisdom and the constitutionality of using the taxing power for such purposes. The outstanding leader in the fight for federal legislation was Harvey W. Wiley, chief of the Bureau of Chemistry. The "embalmed beef" scandal of the Spanish-American War and the muck-raking that followed Upton Sinclair's *The Jungle* (New York 1906), which dealt with meat packing, and Samuel Hopkins Adams' articles on patent medicines in *Collier's Weekly* in 1905 and 1906 did much to assist his efforts. In 1906 the Food and Drugs Act and the Meat Inspection Act were passed, dealing only with the interstate and foreign commerce in foods and drugs. The Food and Drugs Act makes a misdemeanor not of adulterating or misbranding but only of the shipment or offering for shipment in interstate or foreign commerce of adulterated or misbranded goods. Products manufactured and consumed within the confines of a single state are subject solely to the control of state laws. The Food and Drugs Act has been amended to require that the outside of a package bear a statement as to the quantity of food within and to prevent the placing of misleading curative claims on the labels of medicines, but it does not cover statements made in advertising matter not accompanying the goods.

The early history of the enforcement of the law was a stormy one. The Bureau of Chemistry, charged with the collection of the evidence of violation of the law, came into conflict with the secretary of agriculture, with some Department of Justice officials and finally with Presidents Roosevelt and Taft.

The lack of harmony in Washington was reflected in a lack of uniformity in local food and drug control in the states, in part because of differences between laws but largely also because of differences in interpretation and administration. One of the principal sources of lack of uniformity was and to some extent still is the lack of legally enacted standards and definitions, which under the federal law exist for drugs only, as set down in the *United States Pharmacopoeia* and the *National Formulary*. As the result of a conference in 1913 of officials enforcing state food and drug law the secretary of agriculture established a Joint Committee on

Definitions and Standards, representing the National Association of Food, Drug, and Dairy Commissioners, the Association of Official Agricultural Chemists and the United States Department of Agriculture. The secretary of agriculture publishes definitions and standards for food or drug products set by this committee. Although such standards do not have the force of law, in practise they have great weight with the trade, local enforcing officials and the courts and have helped to bring about a greater degree of uniformity in the control of food and drug products.

The enactment of food and drug standards by law has often been advocated both in this country and abroad. While such standards would make enforcement simpler, less expensive and more efficient, the existence of rigid standards difficult to change would be likely to hamper progress in the food industries and to render difficult the introduction even of meritorious new articles or new methods of manufacture. This might be avoided by delegating the authority to promulgate and to alter definitions and standards to some responsible government administrative agency.

The history of legislation in control of drugs differs from that dealing with food because of the general regulation of pharmacy as a profession. The practise of pharmacy laws passed by the states early in the nineteenth century helped maintain the purity of medicines. Furthermore, a large proportion of crude drugs has always been imported, and proposals to supervise importations met little opposition. The New York College of Pharmacy, soon joined by the Philadelphia College of Pharmacy, urged legislation in 1831, and Congress responded in 1848 with an Act to Prevent the Importation of Adulterated and Spurious Drugs. The administration of the law became unsatisfactory after a few years, since drug examiners were usually appointed for political reasons rather than for fitness.

In 1887 Congress passed an act to prevent the importation of opium, and from 1895 to 1906 many states and territories paid special attention to opium and other habit forming drugs in their general food and drug legislation. In 1907 North Dakota required the presence of habit forming drugs to be declared upon the labels of medicines, establishing a widely followed precedent which has practically driven narcotics out of patent medicines. Such legislation failed to control the opium evil, in which the United States

had become especially interested with the acquisition of the Philippine Islands; and by the act of March 4, 1909, amended in 1914, the United States prohibited the importation and use of opium for other than medicinal purposes. The Harrison Narcotic Act, applying to both opium and cocaine, was passed December 17, 1914, and amended May 26, 1922. It is administered by the Bureau of Internal Revenue, which through the imposition of a small tax requires all who handle or use these drugs to be registered and to keep records in order that illegitimate trade and uses may be punished. In addition, international conventions have been adopted in an effort to restrict international trade in opium and its derivatives.

While the Harrison Narcotic Act, the Meat Inspection Act and the Food and Drugs Act have cured or restricted many very great evils, they have grave defects apart from errors of administration. So far as concerns the Food and Drugs Act the most serious are the lack of authority to inspect warehouses, of any restriction whatsoever upon the use of the most virulent poisons in drugs or of jurisdiction over fraudulent statements other than those in or upon the packages of foods or drugs. Furthermore, the common practises of adulterating such commodities as textiles, leather goods, cosmetics and articles of common household use, sometimes with dangerous substances, is altogether uncontrolled.

INTRODUCTION. Food industries are a product of urban civilizations. Primitive peoples, whether absorbed in the struggle for mere existence or relying on nature's bounty, lead too immediate a life to develop what could strictly be called industries of any kind. But when at certain favorable sites the city evolved from the village, growing wealthy through trade or through military strength, the community ceased to be self-supporting. Foodstuffs had to be secured from the surpluses of surrounding territories and the maintenance of the food supply became a prime object of government. Dealers in grain, oil, wines, figs, spices and dried fish appeared; they organized, usually under the supervision of the authorities, the earliest food industries.

With the disintegration of the Roman Empire the channels of economic life in the western world were blocked and cities dwindled in size and power. The agrarian feudal system, torn by constant strife, was forced to rely on the peddler, the fair and the market for all but the bare necessities of its food supply. Trade in spices

and a few luxury products never ceased, but the preparation and distribution of most foods were entirely local matters. Gradually, however, as order was reestablished the towns revived and their skilled freemen formed themselves into guilds of bakers, vintners, pepperers, fishmongers and the like, which acquired monopolies of the production and sale of certain foodstuffs.

The invention and use of power machinery and the industrialization it entailed, by enabling that fraction of the population which is engaged in agriculture to support large city populations, have vastly raised the standard of living of the community as a whole and have been both the cause and the effect of the development of modern food industries. In the newly settled countries this development has been more striking than in the old. European peasants have since the Middle Ages lived, for protection and mutual aid, in communal groups, which made possible a certain degree of specialization of function and the provision of common facilities, such as mills and bakeries supervised and regulated by

the authorities. But the settlers of the American continent were of necessity self-sufficient. Each household raised and prepared its own food and its own textiles. Today as a result of modern industrial processes the city dweller knows of milk only that it comes from a bottle, of bread that it is wrapped in cellophane, of vegetables that they come regularly to market. But to provide him with his fruit and cereal for breakfast, his coffee with cream and sugar, his bacon and eggs, his buttered toast and jam, great industries have been developed during the last hundred years to gather these foodstuffs from the producer and transport them to the manufacturer, to process them and to distribute them through wholesaler and retailer to the ultimate consumer.

Especially in the United States but also in many European countries in the last two decades changes in technique and scale of operation have had such far reaching results that the situation in 1931 differs in kind rather than in degree from that of the pre-war period. At each stage the individual enterprise is being superseded by the heavily capitalized corporate or cooperative organization. The producers' society now sells fruit, dairy products, milk, livestock and wheat directly to the chain store or to the large manufacturer. Nationally advertised brands are proof of the fact that the whole United States forms essentially one market for the less perishable foodstuffs. The market for staples such as cereals, canned goods, chilled meat and fruit and even cheese is world wide. The consumer alone lags behind in successful joint action to promote his interests.

Nevertheless, the changing demands of the consumer have fundamentally modified the manufacture and distribution of foods. The average diet today includes more milk and dairy products, more sugar, more vegetables, more fruits generally, but fewer apples and fewer breadstuffs than thirty years ago. An estimated decline of 10 percent in the per capita calorie value of the food consumed has been attributed to the lessening of physical labor in the machine age; to the increasing proportion of old people in the population; and more particularly to a greater knowledge of food values, which has led to care in the selection of the diet, partly in the interest of fashion, partly of hygiene. The growing demand for ready to serve foods may be attributed more directly to the effect of industrialization and mechanization on community life. The smaller families, which make possible women's activities outside the home; the shift

from houses to apartments with their small kitchens and decreased storage space; and the increased renting and frequent moving, which deter the installation of cooking equipment, have combined to revolutionize the types of food purchased by the housewife in the large and even the medium sized American city. Bread, breakfast foods, canned goods, soft drinks, ice cream and confectionery are now staples. The trend away from home cooking has gone even further: according to the census of distribution 136,000 restaurants and other eating places sold in 1929 food valued at \$2,100,000,000, an amount almost one fifth as large as the net sales of \$11,300,000,000 made by the 498,000 retail food stores. Combined sales of restaurants and food stores accounted for more than a quarter of the total retail sales of the country.

Great as the changes have been, the problem of the efficient distribution of food is by no means solved. The wastes of overproduction and of spoilage and the distributive costs resulting from unnecessary handling, too much competition and excessive advertising are enormous. The problem of price control looms more insistently with every increase in the size and power of the corporations controlling the food industries.

The importance of reducing costs and stimulating consumption is obvious in a world where large parts of the population suffer from periodic famine and chronic undernourishment. The Chinese, who live on a daily handful of rice or pulse, cannot support large scale food industries. In certain parts of Europe the lower standard of living limits trade in cereals, dairy products and meat intended for domestic consumption. And even in the United States there are wide variations in effective demand for foods. Consumption of meat, dairy products, white flour and vegetables is greater in the north and west than in the mill villages and mining communities of the south, where compulsory trading at high priced company stores often cuts far into the worker's low purchasing power.

Governments have from the earliest times been forced by the narrow margin of subsistence to take action to preserve and promote the quantity, quality and price of essential foods. In Europe prices of important commodities have been determined by the authorities and the hours and conditions of work in food processing establishments regulated. In the United States emphasis has been placed on inspection and regulation of quality and on the prevention of monopoly control. The tariff has also been used to influence

prices—generally, as in Germany today and less effectively in the United States, to protect the farmer; few countries have followed the English in rejecting tariffs on food. Yet even Great Britain has levied the customary internal revenue duties, sometimes with startling results, on such staples as tea, salt and beverages, the consumption of which, it was thought, would scarcely be affected.

In Europe the consumers themselves have shown a more active interest in the question of food distribution than have the more mobile populations of the United States; and by the organization of consumers' cooperative societies they have done much toward its rationalization. The English Cooperative Wholesale Society, for instance, owns a tea plantation in India, dairy and fruit farms in Great Britain and is the largest flour milling operator in the country. In Germany, the Scandinavian countries, Switzerland and Czechoslovakia the consumers' societies are especially significant; only in southern Europe have they failed to make much headway. Soviet Russia has gone farthest, in theory at least, in fitting the food industries into a planned economy and in encouraging the consumers' cooperative society, an organic part of the state, to undertake the production as well as the distribution of food.

With increasing integration lines of demarcation between the various food industries are becoming less clearly drawn: large distributors of food themselves engage in its processing; meat packers are drawn into the production of staple grocery products. It has therefore been somewhat difficult to separate sharply the discussion of food industries from other topics. In general this article has been restricted to a treatment of those still distinct industries which involve only the processing of food and to a survey of the problems of food distribution. Food supply and the production of certain foods as well as those industries, such as meat packing and slaughtering, canning and the dairy industry, in which the earlier stages of production form an integral part of the industry, are treated separately.

INEZ POLLAK

BAKING INDUSTRY. *Europe.* The early records of every known civilization make it clear that from time immemorial peoples living in close settlements have been served by members of the bakers' craft. The small unleavened cakes which primitive peoples baked before a fire on flat

stones had by the time civilization had progressed far enough to leave written records been largely superseded by the more satisfactory fermented product. All the cereal grains and many varieties of nuts, vegetables and fibers have been used as breadstuffs at one time or another. Wheat, however, has always been the staple grain of the Mediterranean peoples, and as the northern Europeans became acquainted with its use they too tended to adopt it as a basic food. While rye is still the major cereal food for large portions of the human race, the use of wheat has grown steadily even in areas where it cannot be raised in sufficient quantities to satisfy the demand.

Early in the history of Egypt, Greece and Rome as well as of China and the rest of the Orient there existed a thriving bakers' trade, which because of its fundamental relation to the food supply was invariably under close state supervision. Although in these early communities the baker often operated on a purely commercial basis he sometimes performed also a communal or religious service. Bakers' guilds were of importance in Rome and also in Hellenistic Egypt and the Byzantine Empire.

In mediaeval Europe baking and milling were feudal rights accruing to the lord of the manor and were among his most lucrative forms of taxation. In order to enforce his right and since moreover he alone owned the rather expensive equipment necessary to perform these operations he compelled all baking to be done in a communal oven. Where the feudal authority rested in a monastery or in some religious dignitary, either of these exercised the same privilege. It is probable that the more isolated rural communities always did their own baking.

In the towns the monopolistic character of the baking industry closely resembled that of other mediaeval industries. The bakers' guilds attained a high rank among the industrial guilds. In general their position was protected by stringent apprenticeship requirements restricting entrance to the trade. In return for a monopolistic relation to their market they were subjected to rigorous supervision designed to restrict the price of bread and to protect the food supply by definite provisions as to the exact quantity, quality and type of ingredients to be used in the composition of bakery goods. At a somewhat later period more general codes for the conduct of the baking industry became common. The English Assize of Bread of the year 1266 affords an example of this early type of restriction. The enforcement of the law was left to the local au-

thorities, who at set intervals drew up tables of the required weight of a loaf of bread of a given price and quality as determined by the existing price of wheat plus an allowance for expenses of production and a small profit. The assize was still in effect in parts of England in 1836, when it was finally repealed and bakers were required to sell their bread by weight.

In other countries restrictions surviving from the Middle Ages still hamper the freedom of the baker. French bakers in addition to being subject to the ancient *taxe du pain* are forced to sell their bread at a price set by the local authorities; and although the law of 1924 gives the industry more freedom, they claim that the price is often set with a view to political expediency regardless of bakery costs. Bread prices in Germany are also fixed by governmental authority and the condition of the trade is strictly controlled by the government acting in conjunction with a very effective union organization. In certain countries the vital importance of bread has caused the authorities to regulate the industry more drastically than ever before in peace time. Since 1928 Italian bread production has been subject to complete control by the state. In Russia bread can be sold only to holders of ration cards.

The European baking industry emerged from the Middle Ages with a well defined market. Since the average European household was not equipped for baking, the consumer was accustomed to supply his bakery needs at the bake-shop. This situation affords an interesting contrast with that in the United States, where the isolation of the pioneer household with its ingrained custom of home baking definitely retarded the development of the commercial bakery. At the present time the commercial baker produces practically all the bread consumed in most countries of Europe. In contrast with the prevalent over-the-counter methods of retailing in the United States, in Europe over 80 percent of all bread is delivered at the door by the baker's wagon.

The greater part of European baking is still done on a very small scale by craftsmen producing a varied line of baked goods and catering to the demands of particular clienteles. Little or no machinery finds its way into such shops and, while many individual bakers have become consummate artists in some particular line, standardization of product as it is known in the United States has been very slow to take root among European populations. The typical European baker today uses inherited rule of thumb

procedures which do not differ fundamentally from those described in the inscriptions and literature of ancient civilizations. There is, however, considerable interest in baking techniques; in England, Scotland, Germany and France the industry supports trade schools with expert staffs engaged in both training and experimental work.

The bread industry as a sheltered trade safe from foreign competition has paid relatively high wages. In Germany the average wage for skilled workers as established by collective agreements increased from RM 28.84 in 1913 to RM 46.18 in 1928 and made a further advance in 1930 to RM 50.69. The wages for apprentices rose from RM 23.45 in 1913 to RM 39.89 in 1928 and RM 43.58 in 1930. In England in 1924 men, who form 85 percent of bakery employees, earned 54/1 for a 48-hour week, women 24/11. Trade union organization is fairly strong when allowance is made for the large portion of the industry still conducted on a small scale, often by the proprietor and his family. In 1929 Germany reported 23,400 bakers in the open union, 2300 in the Christian Socialist union and 32,840 sons of master bakers in the Meisterfreundliche "Bund der Bäcker- und Konditoreigesellen."

Night work has been characteristic of the baking industry. The nature of the production process and the time element involved have made it expedient for the baker to work at night if he is to supply his clientele with fresh bread at an early morning hour. European governments have universally prohibited night work on the ground that it is unhygienic and deleterious to the workers' health; but in many cases the bakers themselves strenuously protest against such regulations and are often willing to pay the penalty involved by violation rather than conform.

In many parts of Europe cooperative societies have been conducting bakeries for many years. In England these bakeries form one of the largest departments of the cooperative society and have attained a size not surpassed by the non-cooperative commercial establishment. In France the cooperative has been smaller in character and has been largely a place where arrangements are made for farmers to exchange wheat for bakery products. In Germany 30 percent of the consumers' cooperatives operate bakeries.

Certain advantages accrued to the baking industry as a result of the World War. The problem of baking the immense amounts of bread required by the armies hastened the introduction of more modern methods of production, and

government operated bakeries equipped in the most modern manner were erected in many places to supply this demand. Chemists devoted their attention to problems of fermentation and the best combination of materials. Production wastes were investigated and cut down. At the end of the war the industry found itself with a body of authentic information which was based on scientific knowledge rather than the rule of thumb procedures of centuries. Although the relaxation of government supervision in the past decade has allowed most of the bakers to fall back into their old habits, a modicum of improvement remains. Several mechanized bakeries have sprung up in northern England, Scotland and Ireland. Austria has one of the largest and most perfect mechanical bakeries in the world in the Hammer Plant at Vienna. Soviet Russia has built a mechanized plant in Moscow which is big enough to feed one third of the population of that city. Mussolini has decreed the remodeling of all bakeries so that bread can be produced by the most sanitary and efficient methods. He proposes that in five years all Italian bakeries located in cities of 20,000 inhabitants shall be equipped in the most modern manner.

The European baking industry will no doubt gradually develop more large scale units, particularly if the apparent trend toward mechanization continues; but for the present such bakeries are not making great inroads upon the small established bakeries. There are two essential reasons for mechanization: conservation of raw materials and conservation of labor. It has never been demonstrated that a mechanized bakery unit uses raw materials more effectively, although it does of course conserve labor. Since, however, labor is plentiful in Europe and since there is no reason to believe that the mechanized product is superior to that of the craftsman, it is probable that in the near future there will be relatively few changes in the essential character of the baking industry.

URSULA BATCHELDER STONE

BAKING INDUSTRY. *United States.* In America the growth of the baking industry has accompanied the urbanization and industrialization of the country. The isolated farmer's wife baked her own bread, and until recently many a city housewife followed her example. But beginning with the discoveries of Pasteur concerning yeast and its cultivation science and invention have so perfected automatic mixing, baking and wrap-

ping machinery as well as standardized materials that bakers' bread is often superior to the homemade product. It may generally be had so cheaply that where readily available it has practically eliminated domestic baking of plain breads. While it was estimated that in 1901 only one third of the urban bread consumption was supplied by the baker, in 1918 the baker's share had risen to two thirds, and in 1928 according to a study made of bread purchasing habits in fifteen Pennsylvania towns fully seven eighths was purchased. Per capita consumption according to the Pennsylvania survey averaged 2.53 loaves a week, ranging from 3.05 loaves per capita in Russian households to 2.32 loaves in American. Lower American consumption is perhaps an indication that as standards of living increase bread tends to form a smaller part of the food supply.

In spite of the increasing diversity of the average diet bread remains an important food. Commercial baking ranked tenth among the fifteen billion-dollar industries in 1927, and was exceeded among the food industries only by meat packing and slaughtering. Factory production of bakery products in 1929 was valued at \$1,510,000,000, of which approximately 55 percent was bread, 26 percent cake and pastries and 19 percent biscuits and crackers. Progress in the techniques of baking has served both as cause and effect of the expansion of the baking industry and has made possible an increase in the scale of production. The modern factory is superseding the cellar bakery in the making of bread as well as of crackers. As in other industries the growth in the size of the production unit has been followed by the grouping of units under central control. Of the nearly 17,000 bakeries in operation in 1925, 278, or 1.6 percent, operated by fifty-seven companies, produced more than 30 percent of the estimated output of commercial bread.

The first consolidations of bread bakeries occurred early in the nineteenth century and were local in character, uniting actual or potential competitors. After 1910 combinations of plants located in different cities began to take form and in 1921 reconsolidation of bakery organizations was begun. By 1925 there were thirteen companies operating 222 plants. Early in 1926 the Ward Food Products Corporation was organized; its apparent purpose was to hold the stock of the three corporations in which W. B. Ward was interested: the Ward Baking Corporation operating eighteen bakeries, the General Baking Corporation operating forty-two and the Conti-

mental Baking Corporation operating, in the United States, ninety-one. These three corporations had been affiliated at one time or another through a community of stock ownership and of organizing personnel and produced nearly one fifth of the commercial bread of the country as well as a considerable proportion of the cake. Shortly after the organization of the Ward Food Products Corporation the Department of Justice filed a bill in equity against the several Ward corporations and against various individuals alleging violations of the federal antitrust acts and asking for an injunction to prevent further violations. The court entered a consent decree dissolving the Ward Food Products Corporation and restraining the several defendants in respect to their future interstate activities. Notwithstanding the activity of the government the merging of bakeries has continued and has sometimes proved very profitable. In 1930 the common stock of one, the General Baking Company, expanded by stock dividends, was earning the equivalent of \$146.97 per original share valued in 1916 at \$2. Consolidation of baking and other general food companies is also taking place. In 1931 after a bitter proxy fight control of the Ward Baking Corporation passed to interests connected with the Gold Dust Corporation and the Standard Milling Company.

Classified by method of distribution bread bakeries fall into two principal groups: the wholesale bakery system and the retail. The Ward companies are the leading examples of the former, the chain stores of the latter. According to the preliminary census of 1929 approximately 82 percent of the 16,204 bakeries reporting did an exclusive or partial counter business; this group, however, apparently produced less than 50 percent of the volume. The study of purchasing habits in the fifteen Pennsylvania towns referred to above indicated that grocery and delicatessen stores selling their own or wholesalers' brands supplied 58.9 percent of the bread consumed, retail bakeshops 16.4 percent and bakers' wagons 28.1 percent.

Average bread costs of wholesale bakeries for the period from 1923 to 1925 as shown by the Federal Trade Commission were \$.067 per pound, of which \$.023 was for flour, \$.091 for other ingredients, \$.017 for manufacturing, \$.016 for selling and delivery and \$.002 for general and administrative expense. Labor costs for three large companies were only \$.006 in 1930. Average profits were \$.007. An average retail grocer's margin of \$.012 gave a consumer's

price through the wholesale channel of \$.086. This included credit and delivery on perhaps 60 percent of the bread. The consumer's price on bakery bread delivered from house to house was slightly more (\$.089) and included full delivery and large credit services. The consumer's price on chain store bread averaged \$.06 and included no delivery or credit. Generally speaking, ingredients of poorer quality are used in chain store bread and selling and advertising costs appear to be lower. On the other hand, chain stores frequently sell bread as a "leader" at little or no profit, while some bakeries appear to charge a part of the extra cost of their fancy products against their plain staple loaf. The advantage of lower costs claimed for the bakery merger has not been proved by cost studies, in which comparison of the costs of plants of single plant companies with those of multiple plant companies, size for size, has disclosed little difference, slightly lower administrative costs being offset by higher expense for materials. The case is better for large scale plant production, for although there are marked exceptions, large plants usually have lower costs than small.

Bread prices follow in a general way those of flour but with considerable lag and with less frequent and extreme changes. Where differences in costs are slight, the greater stability of bread prices in some cities than in others indicates a lessening of competition. To what extent the merger is a contributing factor in this has not been demonstrated. The three companies formerly dominated by Ward are, however, said to control 90 percent of the wholesale market in New York and other large eastern cities. Trade associations, national, district and local, are often instrumental in reducing competition. Local price agreements have been found to be operative in some instances. The fact that the bread trade is usually intrastate makes action by the federal government impracticable even where monopoly conditions prevail. Bread prices in the United States are not only higher than Canadian prices and twice as high as British prices, although British bread is made from imported wheat, but they show less tendency to decline during depression. The American retail price in December, 1930, averaged \$.085 as compared with \$.09 for the yearly average in 1929, while the corresponding figures for Canada were \$.066 and \$.078 and for Great Britain \$.038 and \$.044.

Cooperative bakers have had comparatively small success in the United States. Out of 656 distributive societies studied in 1930, including

over a third of the consumers' cooperatives in the United States, only eight were bakeries. In addition twelve general societies operated bakeries, as did one wholesale society. The eight bakeries reported a net gain of 1.8 percent on sales totaling almost \$1,000,000.

The manufacture of biscuits and crackers constitutes a distinct although minor branch of the baking industry and is characterized by a relatively small number of plants of large but practically stationary output. The value of the product of the 176 plants in the United States in 1919 averaged \$1,159,000, of the 220 plants in 1927 \$1,132,000 and of the 261 plants in 1929 \$1,019,000. Large scale production is made possible by the low perishability of the product and by the simple processes of manufacture, which favor the use of automatic machinery and high division of labor. Because of the large capital outlay required plants are usually owned by corporations. The leading cracker manufacturer, the National Biscuit Company, operated in 1921 twenty-eight cracker plants having 29.9 percent of the output of this branch of the industry. In 1928, besides increasing its cracker bakeries to forty-one, producing about half of the total in the United States, this company was operating eighteen bread and cake bakeries and a milling company which milled flour exclusively for the company bakeries. Not only has it acquired many of its bakeries through merger but it has recently added the Shredded Wheat Company and Wheatsworth, Inc., to its holdings. Its policies have been so successful that since 1922 it has been able to split its stock seventeen and one half for one.

The nineteenth century bakery was generally small. Much of the labor was performed by the owner and employed labor was never strongly organized. Hours were long, frequently running to 120 per week, and night work was the rule. Wages for the skilled baker rarely exceeded \$2.50 per day. The growth of the bakery unit which created an increasing proportion of wage workers was followed by more effective unionization. The Bakery and Confectionery Workers' International Union with 20,000 members, including workers in ice cream and cracker establishments, has locals in many cities where there are considerable numbers of bakery employees. The larger bakery plants have, however, proved harder to organize than medium sized plants. The great majority of the 200,000 workers in bread and biscuit establishments are still unorganized.

Partly as a result of aggressive organization activities the nominal yearly wages of bakers have more than doubled since 1909 and hours have been reduced 20 percent. The forty-eight hour week with one day off is becoming common. Night work is gradually being eliminated by agreement and in the case of women by state legislation. The percentage of child wage earners is much smaller than formerly; on the other hand, women are increasing in number, comprising over one fourth of all the wage earners in the industry in 1919. Union agreements provide for equal wages for equal work as between men and women and otherwise safeguard the working conditions of women. The yearly income of all wage earners, excluding those in the biscuit and cracker industry, averaged \$1450 in 1929. Hourly earning, however, as of January, 1931, in nine large cities showed great variation, ranging from \$.93 in New York and \$.82 in Chicago to \$.73 in Boston and \$.56 in New Orleans. A study of wages in Cincinnati in 1925, where 75 percent of the workers are organized and 40 percent are on night shift, indicated that women's modal earnings averaged from \$12 to \$15 a week while the men averaged about \$30. In the cracker industry, where less skill is required than in the bread and cake industry, the number of women workers is relatively large and wages are consequently low. In 1929 annual income averaged only \$1010 for all wage earners.

With a view to safeguarding the cleanliness and wholesomeness of the product two thirds of the states have enacted legislation regulating the conditions of employment in bakeries and other food producing and distributing establishments. This legislation sometimes combines ideas of employee welfare with protection of the public health. Since 1917 the establishment of a ten-hour limit for men in certain trades, which was held unconstitutional in 1905 in the case of *Lockner v. New York* (198 U. S. 45), has been recognized as legitimate. New Jersey has such a law today. Many states have enacted laws requiring bread to be wrapped, regulating weights of loaves and prohibiting the return of stale bread to the bakery. Both federal and state governments have, under the authority of pure food acts, adopted standards of quality and purity of bakery products.

G. A. STEPHENS

BEVERAGE INDUSTRY. Mankind has made use of a great variety of beverages in the course of the centuries. Water, the simplest, is still the

most widespread and in bottled form it is the basis of a minor industry for regions where the local water supply is impure. Alcoholic beverages are among the oldest of all drinks (*see* LIQUOR INDUSTRY; WINE); of more recent use, especially in Europe, are tea and coffee (*see* PLANTATION WARES).

Most recently developed are the carbonated beverages, the manufacture of which has grown to striking proportions in the United States in recent years. Mechanically carbonated or aerated waters were first manufactured in Geneva by Nicolas Paul in 1790. In the United States they were first produced by a Philadelphia chemist, who in 1807 used the process of artificially charging water with carbon dioxide, which had been discovered by Joseph Priestley in 1772. The soft drink became the popular substitute for the spring waters which had long been used for their medical properties by wealthy Europeans.

Since the passing of the Volstead Act the term beverage industry as used by the United States census includes only the manufacture of what are popularly known as soft drinks, carbonated beverages (soda, pop, ginger ales and the like), cereal beverages, fruit juices and mineral waters. This article will be confined to a discussion of such beverages. In 1929 approximately 10,000 concerns in the United States were engaged in manufacturing and bottling these beverages; in 5047 of these establishments the census in 1929 reported some 28,000 wage earners engaged in the manufacturing processes.

The prohibition law in the United States has contributed considerably to the demand for non-alcoholic drinks. Sales of one national brand of root beer increased fourfold during the first ten years of prohibition, and the market for ginger ales and other mixers has widened enormously. The near beer industry has disappointed the hopes raised by its first six months of popularity. Real beer, whether imported or diverted, has competed all too successfully with the legal article. The total output of $\frac{1}{2}$ percent beer in 1927 amounted to only 7 percent of the beer production of 1914. In 1926 the Enforcement Bureau established the Brewers' Unit, with which the legitimate brewers cooperate in detecting offenders; but, although this has improved the situation to a certain extent, the conversion of the old breweries has been a difficult and often disastrous process. In 1930 only about 200 breweries in the United States were engaged in the manufacture of substitute beverages as against 667 in 1921.

The largest division of the beverage industry accounting in 1929 for about 80 percent of the value of the total product, manufactures carbonated beverages. These are made of water, sweetening, fruit juices, fruit acids or root flavors and coloring ingredients, into which carbon dioxide gas is forced under pressure. Of the 7500 bottling plants in this field only about half are large enough to be included in the census figures. Output in the United States increased from 6,000,000,000 half pint bottles in 1916 to 12,500,000,000 in 1930, indicating an average per capita consumption in 1930 of 110 half pint bottles without allowing for exports. Producers and bottlers of these carbonated drinks claim to employ more than 120,000 persons, including salesmen, delivery men and salaried employees, or an average of about sixteen to a plant. Workers engaged in manufacturing operations number not more than 25 percent of those employed by the average firm, because of the unusually large sales and distribution force.

The introduction of modern automatic machinery has revolutionized beverage production. Until 1914 hand processes were still nearly universal. But by 1919 specialized automatic machinery had been installed which mechanized almost all operations from the mixing of ingredients to the filling and corking of bottles. Automatic conveyors are used extensively, especially in the larger plants. Where the best foot power machines previously produced forty to fifty cases a day, the present day machines will produce 600 to 2000 cases; and new machines with faster speeds are being developed each year to wash, sterilize, syrup, fill, crown and label bottles. Automatic labeling machines, for example, work at the rate of 120 bottles a minute; large bottle washing machines both cleanse and sterilize as many as 6000 a minute. A typical crowning machine has a capacity of about 130 a minute.

Large scale production and the growth of companies doing business on a national scale have been greatly facilitated by scientific discoveries, such as new methods of refrigeration, and crystallization and electrical pasteurization of fruit juices. Refrigeration has made it possible to concentrate and freeze certain fruit juices for storage and shipping without impairing their flavor or quality. The growth of motor truck transportation has stimulated the development of companies serving a much wider territory than formerly. Some 28,000 motor trucks are used in the United States by the beverage bottling industry.

With the exception, however, of cereal beverages, some fruit juices and ginger ales made by large national distributors most beverages are still made from flavors, syrups or concentrates and bottled at plants serving a local territory in order to avoid the relatively great expense involved in shipping the product. In the case of nationally advertised specialty drinks it is customary for the proprietors to manufacture the syrup or flavor, which is then sold to individual bottlers who are given a franchise for a definite distribution territory. The Coca-Cola Company, for example, has some 1250 bottlers and 2200 jobbers and sells the ultimate product through more than 120,000 soda fountain distributors and 800,000 bottle retailers. It distributes its syrup in some seventy-six countries, having its own bottling plants in some twenty-seven foreign countries. The company spends more than \$5,000,000 a year in advertising its product. The smaller local manufacturer of the typical soft drink who has no franchise from such a big national advertiser makes and markets his own product, although he often buys his syrups and other ingredients from companies specializing in these lines. He is assisted in his sales efforts by the advertising and publicity prepared by the American Bottlers of Carbonated Beverages, the national trade association of the industry. This advertising has increased sales not only in the summer but also in the colder months of the year.

New developments in bottling machinery have not only made beverage manufacturing much more profitable to the bottlers but have at the same time reduced wage costs through the introduction of what the employers called unskilled and cheaper labor. With the exception of a few technical men, brewers and chemists, the labor now used is unskilled. This is reflected in the wages of unorganized workers in 1929, averaging from \$20 to \$25 a week depending on local conditions. Labor cost is the smallest item in factory cost; in a group of plants of various sizes examined by a national trade association labor costs averaged about 17 percent of total factory costs. Low wages are made still more inadequate by seasonal unemployment; many of the smaller plants operate with only skeleton forces during the fall and winter, while others shut down entirely when sales drop off. The low wage scale of the industry is in part due also to the fact that practically none of the employees are organized. The brewers' union, which before prohibition had a membership of 100,000, now

claims about 15,000 members, some 13,000 of whom are employed by cereal and carbonated beverage concerns. These workers still have wage rates substantially higher than those of unorganized workers. But even where this union has collective bargaining agreements with employers, as in New Orleans, typical workers such as crowners, fillers and machine men were working in 1931 for a rate of only \$21.50 for forty-eight hours. Others in bottling departments in other cities worked for \$20 in 1929, while in Philadelphia union soft drink bottlers were reported to be working for a rate of \$31 a week.

Although labor has been poorly paid, the companies, especially those producing nationally advertised products, have been making huge profits. One concern, the Canada Dry Ginger Ale Company, largest manufacturer of ginger ale in the world, increased its output from 1,000,000 bottles in 1923 to 90,000,000 in 1929 and increased its profits more than tenfold during the same period. The Coca-Cola Company, whose sales comprise over 10 percent of the total beverage sales of the United States, has increased its business about 10 percent each year since 1920, and it now makes about 38 cents profit on every dollar of sales. A group of beverage companies investigated by the National City Bank in 1929 reported a higher percentage return on their stock than any other group of corporations in the food and food products field.

ROBERT W. DUNN

CONFECTIONERY INDUSTRY. Sweetmeats have tickled the palate of mankind since the dawn of time. Trade in honey and sugar developed early, but the appearance of a confectionery industry is a recent occurrence. Even the use of chocolate, now almost a synonym for confectionery, is of modern origin. Cacao beans were first brought to Europe by the Spaniards, who had found bitter chocolate to be a drink highly esteemed by the Aztecs. In spite of Spanish secrecy the new chocolate drink rapidly became popular throughout Europe and the culture of the cacao plant was introduced into the rival colonies of the East and West Indies. Fifty years ago it became established on the African Gold Coast, which now produces annually over 200,000 tons of cacao beans, nearly half the world's annual supply.

Milk chocolate, invented by King George II's surgeon in 1727, soon became a popular prescription. Its manufacture on a large scale was begun in 1876 by Daniel Peter, the founder of the

high quality Swiss confectionery industry. Chocolate candies had, however, been sold by Fry and Cadbury before the middle of the century. The old English confectionery house of Terry, founded in 1767, added chocolates to its line in 1886. It is, however, in the United States that the consumption of confectionery has reached the most astonishing total and become most widespread.

WORLD CONSUMPTION OF CACAO BEANS
(Tons of 1000 kilos)

COUNTRY	1912	1927
United States	67	188
Germany	55	70
Great Britain	28	57
Netherlands	25	40
France	27	28
Switzerland	10	8
All other countries	40	78

Source: Knapp, A. W., *The Cocoa and Chocolate Industry* (2nd rev. ed. London 1930) p. 173.

Nearly 1,500,000,000 pounds of confectionery, worth \$750,000,000 at retail (almost \$400,000,000 wholesale), were consumed annually in the United States in the five-year period ending in 1929. These figures do not include factory sales of chewing gum, totaling \$60,000,000 in 1929, or of other chocolate and cocoa products, totaling \$110,000,000.

The marked increase in the consumption of confections in the United States in recent years has been attributed to the prohibition law, although authorities disagree as to whether it is due to the release of more dollars to be spent on food products in general or to the fact that persons who have stopped the use of alcoholic beverages have substituted candy for its stimulating effects on the body. Other factors in the increased consumption of candy are the more convenient five and ten-cent packages and bar forms now distributed and the much wider variety of retail outlets available. Increase in output has been due in part also to strenuous advertising campaigns. In 1927 alone some 495 leading firms spent over \$9,000,000 in advertising, the large firms with the highest sales totals spending a larger percentage of their total sales than the smaller companies. In efforts to combat the competitive appeal of certain cigarette companies the National Confectioners' Association, the trade association of the industry, has conducted expensive publicity campaigns which included the giving of free samples to school children, the celebration of National Candy Week and "Sweetest Day," radio hook ups, "Sweetest Girl" contests and the distribution of slogans

and information about sweets to health workers, doctors and dieticians. Mother's Day raised candy sales for May, 1929, 22 percent above the average for non-holiday months.

In the pre-war period candy was distributed almost entirely through grocery stores and a few candy stores. In 1929 confectionery was distributed through 62,000 candy stores and approximately 60,000 drug stores as well as through soda fountains, restaurants, cigar, chain, department and general stores and thousands of stands and vending machines along the motor highways. In 1930 more than half the sales of manufacturers were through jobbers, 16 percent through chain stores and 20 percent through other retailers, while about 7 percent were sold directly through stores belonging to the manufacturers. Chain stores have been gaining most in sales in the last few years: in 1929 nearly half the manufacturers were selling at least a part of their products through them.

Over two thirds of the confectionery made in the United States comes from factories in the eastern and central parts of the country; New York, Pennsylvania, Indiana, Illinois, Ohio, Massachusetts and Michigan are the leading states and New York, Philadelphia, Chicago, Boston, Milwaukee and St. Louis the leading cities. The factories have concentrated near the centers of population to lessen costs of distribution and to benefit from the unskilled female labor available. Control of the industry has become increasingly centralized because of the growth of larger concerns and the introduction of more capital. In 1929, 65 firms, 13.5 percent of all those reporting to the government, had annual sales of over \$1,000,000 and controlled 63 percent of the national sales volume. The number of larger firms increases, and mergers have absorbed hundreds of smaller ones. Large concerns making other types of food and tobacco products have bought into the industry and grocery and restaurant chains operate their own confectionery plants. This centralization has been accompanied by the manufacture of standardized products by medium sized concerns and by the mechanization and specialization of plants. Automatic machinery is now used, especially in making hard candies, marshmallows and certain kinds of chocolates. Even in chocolate and cream candy plants where hand dipping processes have prevailed there is a tendency to supplant the old methods with machine dipping units. Concentration is most marked in the chewing gum industry, where standardization and

low perishability early led to large scale production and nation wide distribution.

With the exception of the cooking processes, which employ men almost exclusively, and the process of hand dipping, in which fairly skilled women workers are employed, most operations in confectionery manufacture require no training or special skill and consequently absorb chiefly unskilled and inexperienced girl workers. As many as three fifths of the 63,000 wage earners employed in the United States in 1929 were women and girls. Half the candy workers covered in an investigation made in New York City in 1928 were earning less than \$13.75 for full time work during a fairly busy season, while 45 percent of those who worked undertime were earning less than \$11.75 a week. The *Industrial Bulletin* of New York state gives the average weekly earnings for women in representative candy factories in that state in June, 1931, as \$12.37.

Although state laws limit the hours of work, violations are frequent; sixty-five and seventy hours a week are not uncommon among women workers, especially in the busy seasons preceding the Christmas and Easter holidays. Employment is extremely seasonal. In typical plants from 33 to 45 percent of the workers are laid off in the slack seasons early in January and during the summer. During rush seasons work is speeded up. In packing, machine dipping and other processes conveyors are used, while systems of wage payment calculated to achieve the greatest output are in force in many plants. This speed, eye strain, the absence of seats and the low temperature in some of the rooms create health hazards. Studies in New York and other cities showed a large number of factories with low sanitary conditions involving risk for the consumer as well as for the worker. Although health examinations for new workers or a food handler's card are required by law in some states, investigations show that they are disregarded by many concerns, small as well as large. Finger licking is also permitted in some plants. Of fifty-one plants investigated by the government in Chicago and St. Louis in 1921 thirty-seven, or almost three fourths, fell below the standard of providing hot water, soap, individual towels and other indispensable features of sanitary toilet facilities.

Efforts have been made by the National Consumers' League, cooperating with local consumers' leagues, to secure better wages and shorter hours for the workers in candy factories, especially the women, and to see that candy is made

in clean factories by clean workers free from contagious diseases. As its chief weapon it has drawn up a list of standards affecting hours, beginners' wages, seats, cleanliness, sanitation and temperature and has included in a white list those manufacturers in certain territories who meet these minimum standards. Some manufacturers improved their working conditions in order to have their names appear on the white list.

Although in many European countries the manufacture of confectionery has long been concentrated in a few large houses, neither the multiplication of products nor the introduction of machinery has proceeded so fast as in the United States. Problems of sanitation and protection of the workers are, however, similar wherever the industry exists. Cadbury's and Rowntree's in England claim to have model factories, but Board of Trade figures for the whole English confectionery industry show that in 1924, 29 percent of the workers were less than eighteen years old. Average weekly wages for females were twenty-five shillings and ninepence in 1924, ten shillings and fivepence in 1906.

The high quality Swiss milk chocolate export industry, which expanded early in the twentieth century, has since the war been limited by the exploitation of Swiss patents in the United States and other countries. France remains the outstanding exponent of the small scale production of confectionery delicacies by master craftsmen.

ROBERT W. DUNN

FOOD DISTRIBUTION. *Grocery Trade.* Originally grocer meant one who bought and sold in the gross; that is, in large quantities. A grocer was therefore a wholesaler. In England from mediaeval days dealers engaged in wholesale trade or foreign trade were known as merchants. In Scotland, however, as well as later in America the term merchant was applied to retailers as well as wholesalers. In time the term grocer came to be applied to the kinds of goods handled rather than to the quantities bought and sold. Today groceries may have either of two meanings. The first and older use implies a limited list of specific food products; the second includes all foods. The older and more restricted use applies to such commodities as tea, coffee, chocolate, spices, flour, salt, sugar, vinegar, molasses, dried fruits, packaged and canned goods. These were the goods carried in the traditional retail grocery store as distinguished from stores and shops selling other food products, such as butcher shops,

bakeries, dairy and poultry products shops, fruit and vegetable stands, fish markets and so on. During the nineteenth century the traditional grocery store of this type bought all or most of its supplies from the wholesale grocer, who in turn bought his supplies from the manufacturers or producers. The lines of demarcation between food trades were clearly drawn not only as to the types of products handled but also as to channels of distribution. During recent years, however, there has been a decided tendency toward the breaking down of these demarcations and classifications. Great numbers of grocery stores have added meats, fish, fruits and vegetables, dairy products and baked goods as well as ice cream, confectionery, tobacco products, cleaning supplies and many other lines of household wares. Relatively few of the traditional types of either retail or wholesale grocer are still in existence. A survey of the grocery trade in modern times must therefore touch upon the marketing and distribution of all food products.

In earlier times staples such as wheat, oil, dried fish and spices were the chief foodstuffs distributed over any large area. Ancient nations carried on an extensive trade in these products. Greece and Rome had highly developed systems of wholesale and retail trade in food (*see* FOOD SUPPLY). The grocery trade proper may be said to have begun in classical times with the bringing of spices from the East. Throughout the Middle Ages, even when commercial activity was supposed to have reached its lowest point, there continued to exist an extensive trade between Mediterranean cities and the Orient in which western products were traded for spices, dried fruits, oils, sweets and essences. These in turn were widely distributed from Mediterranean cities throughout northern and western Europe.

The Italian cities early took the lead in this trade between the Orient and the rest of Europe. Pepper and spice merchants, chiefly of Italian origin, from Genoa, Florence, Lucca, Venice and Pisa established themselves in England, France, Holland, Germany and the Baltic seaports. There was a regular trade in pepper and other spices as early as the twelfth century. The great demand for spices swelled the fortunes of the traders on the one hand and on the other stimulated interest in a cheaper route to India and the Spice Islands.

The various tradesmen of the later mediaeval period grouped themselves together in guilds for mutual protection and promotion of their

special interests. While the word *grocer* does not appear to have been used in the English language before the fourteenth century, the guild known as the Company of Pepperers of Soper's Lane, of London, the forerunner of the grocers' guild, was in existence before 1180. Similar guilds developed in France and other European countries during the twelfth century and even earlier. The pepperers' guild absorbed the spicers, apothecaries and canvasmen in 1345, forming a body officially known as the *mestier averii ponderis*. At the same time they organized an inner body, the Fraternity of St. Anthony, in honor of the trading saint of Egypt, who later became the patron saint of the entire trade. The pepperers' and spicers' guild already known as the Grocers' Company was first incorporated in 1428. During the fifteenth and sixteenth centuries it exercised great influence in public affairs, not only in London but in all England. It elected several lord mayors of the city of London and its livery and pageants were said to have exceeded all others in grandeur and magnificence. Like the other great liveried companies the Grocers' Company regulated its own trade. Everyone carrying on the trade was required to join the company. Strict rules were set to prevent monopoly or unreasonable prices. The company assumed the responsibility for honest weights and measures as well as for the purity and other standards of the goods handled. For many years the pepperers and grocers had the monopoly of all goods measured by weight. Through the collection of dues and fees as well as by wise investments, the Grocers' Company became wealthy and used its means for charity and education and for the support of the government at critical times. Today the company exists as a social organization and fraternity.

With the opening up of many new lines of commerce during the nineteenth century, with the development of new products and new methods of processing and with changing standards of living the grocery trade developed several new forms of organization and new channels of distribution of food products. Increasing standardization and grading of products made possible widespread purchase by sample. Commodity exchanges (*q.v.*) now act as central markets and price regulating agencies for grains, coffee, sugar and cocoa as well as many of the more perishable food products.

In the marketing of grocery specialties such as package goods, sugar, coffee, tea, canned goods, flour and so on the broker has been and

is still an important factor. He brings manufacturer and buyer together, receiving for this service a commission or brokerage based on the amount of sales and generally paid by the seller.

Between the producer and consumer the wholesaler has, at least until very recent years, been the typical middleman. The wholesaler of the nineteenth century bought in large quantities, often taking entire outputs of canneries and factories; he provided storage space and sometimes financed the producers' operations. He supplied the retailers with stocks of goods and granted them credit, often to the extent of setting them up in business. Thus the old time wholesaler assumed the burden of risk both in carrying goods bought from manufacturers and in granting credit to hundreds of small retail establishments. In spite of recent criticism of the wholesaler and the rapid development of more direct methods of distribution by far the largest bulk of food products still finds its way to consumers through some kind of wholesaler. The wholesaler and his sales representatives were and are still the mentors and advisers of the masses of small independent retailers in all matters of merchandising, store arrangement, display, advertising and the like.

Many wasteful practices had crept into the food distribution system of the nineteenth century. Unnecessary services had developed. Expenses of operation both in wholesale and retail concerns had run unnecessarily high. New types of distributors came into existence, such as chain store systems, mail order houses and large department stores. These large concerns found ways of buying direct from producers or through brokers and of eliminating part of the wholesale expense. This in turn led to marked changes in the organization and methods of operation of traditional types of wholesalers and retailers. Several new varieties of specialty wholesalers have largely taken the place of the older general type. Some have branched out into the production and sale of goods under their own brands and have therefore become manufacturers as well as wholesalers. A great many general wholesalers have given up their former general lines of goods and are now devoting all or most of their attention to the distribution of a limited line of products. Most wholesalers who formerly tried to cover the entire country or even large sections of the country have found that they can operate more economically and satisfactorily by limiting their territories to a small radius rather than attempting to cover the extensive territories

formerly served. The jobber in the food trades, once a separate and distinct type of distributor functioning between the large wholesalers and the retailers, has now largely merged in the classification of specialty wholesalers. Several variations in wholesale service have been devised, such as cash and carry wholesalers, wagon or store door delivery wholesalers, desk and telephone wholesalers and institutional wholesalers. There are still many general grocery wholesalers, but their most successful fields of operation seem to be in the parts of the country where population is sparse and the distances between towns fairly great.

Retail grocery trade outlets now consist not only of regular grocery stores but also of meat markets, delicatessens, dairy and poultry shops, fruit and vegetable stores, food department stores, public markets, food departments in department stores, food departments in drug stores, roadside markets, company stores, restaurants and consumers' cooperatives. The total number of food outlets in the United States according to the 1930 census of distribution was nearly 500,000, or approximately one third of the total number of retail outlets of all kinds.

The chain store system of distribution has reached a high stage of development in the grocery and food trades. Beginning in a very small way with the establishment in 1858 of the Great Atlantic and Pacific Tea Company and others in the 1880's and 1890's, the chain systems now have a volume amounting to about 30 percent of the entire retail food trade of the country. The Great Atlantic and Pacific Tea Company, the oldest of the grocery chains in the United States, is also the largest, with more than 15,000 retail shops and annual sales in excess of \$1,000,000,000. Other large grocery chains include the Kroger Grocery and Baking Company with more than 5000 stores, Safeway stores on the Pacific Coast with about 3000 stores, American stores and First National stores, each with more than 2500 shops, and several other smaller concerns ranging downward to local organizations consisting of two units or more.

One of the recent developments of major importance affecting both the wholesale and retail grocery trade is the organization of retail cooperatives, or so-called voluntary chains. To meet chain store competition on the one hand and to offset the danger of retailer customers forming cooperative buying groups of their own, several hundreds of grocery wholesalers throughout the country have organized and tied up their retailer

customers by understanding or contract in agreements to carry on programs of merchandising much like those of the chains. Most of these wholesalers are in turn members of organizations that are national in scope, serving their wholesale associates by education in proper methods of merchandising, by central buying of both goods and supplies, by advertising and more particularly by promoting the organization among new members. The leading organizations in this field include the Independent Grocers' Alliance, the Red and White stores, Clover Farms stores and many others. By the end of 1930 there were probably fully as many independent food stores tied up in voluntary chain arrangements with wholesalers as there were units in actual chain store systems.

Under the stress of competition with chain stores and other large retail organizations many of the small, independently owned retail food stores have shown marked progress in operating methods. They have learned how to keep their accounts properly, how to gauge consumer demand and its changes and particularly how to modernize their stores to bring them up to date in appearance and in the services rendered to the public. In addition many independent retailers have learned how to sell goods as cheaply as the chains. Although for many years the trend of expenses of operation due to rising wages and increased services and higher costs for advertising has been upward, during the past four or five years the rise has apparently been checked. Wholesalers and retailers have in many cases been able to reorder their business so as to make their total expenses of operation comparable with those found in chain store organizations carrying the same sorts of merchandise and rendering similar services to their customers.

But in spite of the partial success of the independent grocery chains there has been increasing pressure for antichain store legislation on the part of independent retail store interests, retail trade associations and local business men. It may be presumed that special taxation of chain stores will be attempted in numerous states.

Competition in the food trades must continue to be keen while, as is the case at present, scarcely a line exists in which there is not overcapacity in relation to consumption requirements. There is a crying need for control of production of raw materials to the point of proper adjustment to consumption requirements so that prices may be stabilized at points permitting the rank and file of producers to cover at least their costs of pro-

duction. Existing difficulties have led many individual concerns and groups of concerns to attempt to raise their products above the level of some of the most vicious forms of competition. Branding and advertising, particularly of package goods, was one of the earliest and is still one of the most outstanding movements in this direction. Resale price maintenance was another device generally followed by many specialty manufacturers before this method of trade control was outlawed by the Supreme Court in 1911. Some of the most ardent support for specific legislation permitting price maintenance has come from both manufacturers and distributors in the grocery trades.

The merger movement found in other large industries has had its counterpart in the food industries and trades. A large part of the production of refined sugar, soap, corn products and meats is concentrated in the hands of relatively few concerns. During the past five years the amalgamation of companies producing branded and nationally advertised grocery specialties has paralleled the rapid growth of chain store systems and the voluntary chain movement. The most outstanding examples are General Foods, Inc., Standard Brands, Inc., the Gold Dust Corporation, the California Packing Corporation and the National Biscuit Company. There are many other smaller concerns attempting to forge ahead. General Foods alone manufactures and sells more than a hundred products, many of which are nationally advertised. For a number of years there has been a growing undercurrent favoring some change in the antitrust laws of the nation to permit some degree of cooperation among competing producers and distributors in stabilizing the condition of competition.

A certain measure of cooperation among the competing concerns of each of the many industries in the food field has been achieved through trade associations. There are both national and local associations in most of the individual food manufacturing industries. There are also general trade associations, such as the American Grocery Specialty Manufacturers' Association, the American Institute of Food Distribution, Inc., and others, which combine the interests of several industries concerning problems of mutual interest. The American Wholesale Grocers' Association and the National Wholesale Grocers' Association serve the national interests of the wholesale trade, while the National Association of Retail Grocers and the National Chain Store Association represent those of retailers.

One of the most interesting developments of recent years is the attempt to regulate some of the worst features of competition by means of trade practise conferences, rules and codes of ethics. The conferences have been held under the supervision and with the help of the Federal Trade Commission and are intended to find ways of lawful cooperation among competitors.

Through the trade associations considerable progress has been made in educating great numbers of individuals and concerns in methods of accounting and in the computation of expenses of operation. Through association exchanges of information on prices, costs, methods of operation, credit and market conditions the food trades have become much better informed than ever before. Several trade associations carry on a number of cooperative activities, such as trade advertising and sales promotion, market research for new opportunities of trade extension and, in general, sales efforts to increase the consumption of particular products. Some of them have cooperated with the business schools and the Department of Commerce in making trade surveys.

Out of these surveys and out of the attempts of the trade to meet changing consumer demand have arisen a number of interesting theories and experiments. Indeed, the retail food trade constitutes an experimental ground of great extent in which wide varieties of new ideas concerning distribution are being tried out. An increasing proportion of the public seems to desire an increasing proportion of ready to serve foods. Formerly such foods were distributed largely through delicatessens, but they now constitute an important part of the sales volume of all types of food stores. Another interesting experiment involves the introduction of what is known as the quick-freeze process of refrigeration, by which all types of perishable foods are preserved by freezing in such a way as to prevent for indefinite periods of time deterioration in flavor or quality. Still other experiments involve the application of ultraviolet rays, the addition of vitamins and the destruction of all bacterial action and decomposition by a process known as irradiation.

Another line of experimentation lies in finding the price lines at which various food products sell most readily. For example, surveys made in several cities have led to the conclusion that goods priced at 25 cents each, two for 25 cents or three for 25 cents sell more readily than at any other price. A price of 30 cents each seems to result in a total lack of sales. More goods can

be sold at 25 cents or the chain store variants of 23 cents or 21 cents than at 20 cents, even if the amounts and qualities of goods are the same.

The organization of the grocery trade in other countries is very similar to that in the United States, except for some differences in commodities carried and differences in services desired by consumers. In addition to the traditional lines of distribution through wholesalers and retailers, found everywhere, there is in most of the European countries a high development of consumers' cooperative societies, which not only operate local retail stores but also wholesaling and manufacturing establishments. Consumers' cooperation is particularly strong in the food trades in England, the Scandinavian countries, Holland, Switzerland, Czechoslovakia, Austria, Germany and Russia. It is relatively weak in Spain and France and very weak in Italy. In Russia it constitutes the chief channel of distribution for food products. Its only competitors, in fact, are the state owned retail outlets and a few retail stores serving certain manufacturing industries. Private enterprise in the distribution of food has all but disappeared under Soviet rule.

Small food shops abound in all countries of Europe except Russia. These shops are in many cases conducted by old people, women and ex-soldiers. Chain store systems exist to some extent in the field of food products in European countries but not nearly so extensively as in the United States. There are important grocery chain systems in England, France and Germany, but in the other countries the chains are still largely in the stage of infancy.

The European food trades, despite the fact that retail shops are in the great majority of instances very small, are well organized. Trade associations abound, and various forms of cooperative activity, such as cooperative buying, mutual insurance and agreements as to trade practises, are common.

PAUL H. NYSTROM

Perishable Products, United States. The last decade of the nineteenth century marked the beginning of a new era in the distribution of perishable foodstuffs and radically changed the nature of the problem of urban food supply. The successful introduction of the refrigerator car, refrigerated ship and more recently the refrigerated motor truck into the transportation system has transformed the face of the production map. Large urban communities no longer depend upon nearby truck gardens, orchards

and dairies for their food. Remote areas have been opened up for the production of crops on a vast scale in the most favorable climate. Areas like the Imperial valley on the border between southern California and Mexico have been developed under irrigation to produce cantaloupes, watermelons, lettuce, asparagus and tomatoes for markets 3000 miles away, reached by refrigerated freight in less than ten days. The average length of railroad haul for fruits and vegetables in the United States is estimated at approximately 1500 miles.

Since refrigerated transportation has virtually annihilated the limitation of distance upon supply, fresh produce is available to urban consumers at all seasons of the year. Lettuce, tomatoes, beans and cucumbers move to market in a continuous flow, one shipping area following another in rotation as the seasons change. In the course of a year New York City draws fruits and vegetables from forty-two states of the union and nineteen foreign countries. In one day the Covent Garden market in London handles South African peaches, plums and apricots, Nova Scotia and Washington apples, English and Belgian grapes, California pears, Canary Island bananas, Florida grapefruit, Jaffa, California and Spanish oranges, English and French asparagus, French lettuce, cauliflower, cabbage and turnips, Algerian and Azorian potatoes.

These new possibilities in the distribution of fresh foodstuffs have greatly expanded the range of diet of the average urban dweller and given to such perishable foods an increasing importance in the total food trade. At the same time they have been an important factor in changing methods of commercial distribution. When local production and wagon and boat transportation dominated the marketing system, middlemen were few. The producer often came to market with his own wagon to do business with the housewife, the retail storekeeper or the market stand man. Even in the staple grocery trade, wholesalers were few in number and the types of middlemen limited. But with the development of long hauls in car lot units, intermediate assemblers and distributors have rapidly assumed an importance in the marketing structure. To take advantage of the lower rates and quicker service offered by the railroads for solid carloads of a single commodity, car lot assemblers have sprung up at shipping points, buying from the producer for cash and shipping to the city distributors in markets hundreds or thousands of miles distant. Likewise, specialized

receivers, handling car lot units either for their own account or as shippers' agents, have arisen in the cities. These city receivers break up the carloads into fifteen or twenty lots for sale to jobbers or large retailers. The jobbers in turn sell to retailers, who trade with the consumer.

Long haul transportation has, however, by no means eliminated the local growers who truck their produce to nearby markets for direct sale to jobbers, retailers and consumers. Many important cities in the United States, located close to fruit orchards and truck gardens, receive an important part of their food supply by truck, and a goodly portion of this is sold to jobbers, retailers and consumers through municipal or privately operated farmers' plaza markets. Albany, New York, with a population of 127,000, in 1929 received 39 percent of its fruits and vegetables by truck, 30 percent through the farmers' market. Rochester and Syracuse received approximately the same percentages from nearby sources. Newark, New Jersey, with a population of 443,000, in 1930 received 35 percent by truck, 26 percent being sold through the farmers' market. New York City, however, receives only 10 percent by truck, of which only 5 percent is sold through the farmers' market.

Only a small part of the produce sold by farmers in public markets passes directly to consumers. The produce trucked in by farmers to the Detroit public markets in 1923 amounted to about 95,000 loads, or one quarter of the city's total supply. Of this, 75 percent was purchased by retailers and hucksters, 10 percent by wholesalers and only 15 percent by consumers; hence at least one or two middlemen took part in the distribution of 85 percent of the produce brought to the city by farmers.

But the major part of the produce distributed in the United States moves to urban centers by rail rather than by truck. Over 1,000,000 cars of fresh fruits and vegetables and 200,000 cars of butter, cheese, eggs and poultry are shipped annually by railroad. Approximately 80 percent move under refrigeration and nearly all in solid carloads. A refrigerator car in the United States holds a quantity far too large to be assembled by a single grower or handled by a small city jobber. The average carload of Maine potatoes contains 40,000 pounds; of California citrus fruit, 30,000 pounds. Someone must gather together the daily product of the field or orchard from each grower and ship it to the city, uniformly graded and packaged in standard containers.

The car lot assemblers who have established themselves at shipping points to perform these services differ to some degree in function and character. Some are strictly local dealers who maintain warehouses adjacent to railroad sidings at strategic points, to which the growers deliver by wagon or truck. In the case of semiperishables, such as potatoes and cabbage, the produce may be stored for weeks or months in the warehouses after grading and then shipped in car lots to distant city markets. Gross earnings of these shipping point dealers are derived from the difference between what they pay farmers and what they receive from city dealers. Their profit or loss is dependent upon the skill with which they judge the market prices during the season. Some of them are associated with city dealers, sharing the risks of the enterprise. An analogous type of car lot assembler operates from strategic points in shipping carloads of butter and eggs to the city markets.

In the case of the more perishable and seasonal produce the shipping point assemblers are characteristically traveling buyers who remain in one section for several weeks during the peak of the shipments and then move to the next center of production. Such a traveling buyer may be an independent dealer or the agent of a city operator. Many shipments of cantaloupes, lettuce, watermelons and peaches are handled in this manner in the United States.

A third type of assembler is the mutual or cooperative shipping organization. Cooperative growers' associations play a very important part in produce marketing and their functions and characteristics are so varied that no comprehensive treatment is possible here. Viewed purely from a marketing standpoint they perform a service for the grower which is distinct from that of other country shippers, primarily in their control not only over the distribution itself but in the picking, packing and grading of the product. They are non-profit organizations, managed by paid employees and controlled by representatives of the producers themselves. Some are entirely local, confining their operations to sales from shipping point auctions or consigning their produce to city commission merchants; others are federated into regional or national marketing organizations, maintaining sales, advertising and traffic departments for the purposes of regulating the flow of produce into markets, of conducting sales campaigns and of dealing collectively with transportation companies in the matter of freight rates and claim adjustments. A few of the na-

tional cooperative associations maintain district managers in important urban markets but do not generally sell directly to the jobbing trade. One exception is the Pacific Egg Producers, a joint sales organization in New York City for three of the Pacific coast egg cooperatives, which has an auction of its own through which it sells to jobbers, chain store organizations and other large buyers.

The fourth type of car lot shipper, known as the operator, is usually a large shipper, commission merchant or wholesaler, who in order to guarantee himself a sufficient volume of produce for sale has entered into contracts with growers under which each grower is obligated to deliver all of the product of a certain acreage to him for sale. In return the operator usually advances a certain minimum price per unit to the grower to finance the purchase of seed, box material, labels and the like. In the United States the operator is most active in those sections in the south or west which have been recently developed as producing territories. Probably more than 80 percent of the lettuce and cantaloupe acreage in the Imperial valley is under contract. A large part of the Florida tomatoes and northwest apples are handled in the same way.

After produce is dispatched from a shipping point it may pass through brokers or auctions operating on a national scale and handling carloads only. Such brokers are intermediaries between the shipper and the city receiver. Their activities are primarily conducted by telephone and telegraph. A shipper wires a broker that a car of apples is rolling; the broker finds a buyer willing to make an offer and wires the offer to the shipper for confirmation or rejection. A unique experiment in the expansion of this type of service in the United States has been afforded by the so-called f.o.b. auction. Through a chain of offices in leading markets and shipping points linked by private telegraph wires carloads of produce are offered simultaneously to bidders assembled in a far flung chain of salesrooms. Offerings described by federal or state inspection certificates are sold on a shipping point basis; the buyer pays freight charges and orders the car diverted to the desired market.

In the city are a number of dealers receiving carloads as they come to the terminal markets for resale in smaller lots. Partly through custom, partly through the exigencies of transportation facilities, these markets have become highly specialized. In a city like New York there are local-

ized fruit and vegetable, poultry, fish and meat and dairy products markets where dealers buy and sell. Historically the commission man is the oldest and most influential factor among city dealers. He acts as the shipper's agent in supervising the unloading of the car and the selling of the contents in job lots and retains a percentage, usually about 10 percent, of the gross sale price. The car lot wholesaler differs from the commission man in that he assumes ownership of the produce by buying from the shipper either at the shipping point or on delivery in the city, whereas the commission man is merely an agent of the shipper. The keen competition among city wholesalers and commission men for a constant volume of business to support a large overhead sales organization has forced many to become operators by acquiring a financial interest in the growing and shipping function, through crop contracts, joint sharing of profit or loss or guaranties of price and promises of premiums over market quotations.

In the city in recent years the terminal auction has assumed an important place in the distribution of produce. Cars are listed for daily sale by brokers, commission merchants, wholesalers and district managers of cooperatives, and the offers are split up into convenient lots identified by size, quality and brand and listed in printed catalogues. Large quantities of well graded and well packed fruit, melons and eggs are handled through these auctions. Buyers, who have previously examined samples of the offerings, assemble at specified hours to bid for each lot.

The jobber in the produce trade buys from the car lot receivers either directly or through the terminal auction and resells in units of one box or one crate to retailers at neighborhood markets.

The function of the retailer is well known. It is on him that the public depends for its daily food supply. A large portion of the fresh produce is sold to the consumer through specialized fruit and vegetable markets as well as through the regular grocery stores. In some cities, notably New York, the huckster and pushcart venders are important outlets. There are over 8000 licensed pushcarts operating in fifty-three open air street markets in New York City, furnishing an outlet for more than 10 percent of the city's fruits and vegetables. The hotel and restaurant trade is an increasingly important outlet in large urban centers. For the United States as a whole the so-called mass consumption market is estimated at 26 percent of the total, and in the case

of Manhattan Island a large percent of the consumption of foodstuffs is in public eating places rather than homes. The following tabulation based on preliminary reports of the 1930 census of retail distribution indicates the comparative importance of retail outlets for food products in New York City.

	NUMBER OF STORES	NUMBER OF FULL TIME EMPLOYEES
Candy and confectionery stores	7,753	8,043
Dairy products, eggs and poultry stores (including milk dealers)	1,929	11,005
Delicatessen stores	2,383	2,227
Fruit stores and vegetable markets	5,534	2,953
Grocery stores	13,685	12,707
Combination stores (groceries and meats)	1,620	4,336
Meat markets (including sea foods)	8,492	9,229
Bakery goods stores	1,203	3,089
Other food stores	348	198
Food group, total	42,947	53,787
Total, all stores	103,623	316,201

The chain store, which started as a purely retail organization during the last quarter of the nineteenth century, has now become a dominant factor in the field of food distribution. In New York City, according to the 1930 census of retail distribution, 60.34 percent of the total sales of food products were made by 36,209 independent single stores; 24.24 percent of total sales by the 5011 branches of local chains; and 15.20 percent by the 1701 branch stores of sectional and national chains. The largest chain store company in the United States operates more than 15,000 retail units and has carried vertical integration to the point where it not only controls warehouses and processing plants but even country shipping stations as well. Thousands of carloads of produce are purchased each year by chain stores at shipping points, in many instances from cooperative organizations, and are distributed all over the North American continent to regional warehouses and then to the retail units.

The effect of this integration of merchandising control is profound. Many of the wholesalers, jobbers and commission merchants are being eliminated as the chain store assumes their functions. The demand for uniform quality and size by the chain stores has greatly stimulated a standardization of pack on the part of the pro-

ducer and has promoted cooperation among producers for standardization and bargaining purposes. Open market transactions are being considerably reduced by the contracts entered into between growers' cooperatives and chain store distributors. As a result new problems in price establishment and quotation are arising. The purchase of produce in carloads by chain stores with direct routing to their regional warehouses has become an important factor in modifying the physical layout and design of city markets and terminals. Chain store distribution tends to a decentralization of the physical terminal operations as well as of commercial trading and makes the distribution of produce more nearly resemble the handling of meats through packers' branch houses and of milk through distributors' pasteurizing plants.

The cost of distributing produce has been a subject of numerous investigations and a great deal of popular discussion. Analysis of the consumer's dollar into its component parts, while subject to marked variation in periods of rising and falling prices and in different channels of distribution, indicates that approximately 50 percent of the cost of distribution takes place after the produce has arrived at the city terminal. Because of the item of spoilage, which has been reliably estimated to approximate more than 10 percent of the total retail value, the retail margin for perishable produce is considerably higher than that for package groceries. The retail margin for fruits and vegetables in New York City has been estimated to run from 33 to 37 percent, depending upon the channel of distribution. Profits do not appear to be large. Exhaustive studies in 1924 indicated that the annual return per wholesale proprietor in New York City was approximately \$6400 and per jobber approximately \$4500. Independent retailers' profits are notoriously small and uncertain. The mortality of independent grocers in Buffalo, New York, and Louisville, Kentucky, has been calculated to be as high as 30 percent per annum. A study of meat shop profits by the Department of Agriculture in 1923 indicated that half of the proprietors made less than \$3500 per annum.

Apparently the large items in city distribution costs are those associated with cartage, cost of making sales and spoilage. Terminal cartage of produce in New York City, covering only the movement between railroad terminals and retail stores, appears to absorb approximately 6 percent of the consumer's dollar. In the case of milk distribution the trucking from the terminal

to the pasteurizing plant and thence to the retail and distributing branch amounts to 7 percent of the retail price. Milk route delivery to the consumer absorbs 28 percent. Spoilage in the case of the more perishable fruits and vegetables amounts to as much as 13.5 percent. The wage cost of making sales in the retail store amounts to 10 or 12 percent of the consumer's dollar.

Marked progress in reducing trucking costs and spoilage has been made by the chain store distributors in their handling of perishable produce by purchase at shipping point and direct routing to regional warehouses, and the planning of the package unit to conform more nearly with urban demand. The cost of retail delivery of milk appears also to be decreasing on account of the heavier loading of route wagons made possible by the greater concentration of urban population and the sharp reduction in the number of competing distributors.

The cost of making sales through retail stores, on the other hand, appears to be increasing by reason of the steady reduction in the size of the unit quantity purchased by the urban housewife, a result of the lack of storage space in city apartments and the increased irregularity of housekeeping arrangements. The service of filling many small orders and of minute packaging, plus the tendency to multiply stores, throws a greater burden of wage cost upon the retailer per unit sold. Just what will be the effect on food costs of the tendency toward increased mass consumption through restaurants is difficult to forecast. Margins of dealers catering to the more expensive restaurants and hotels are markedly higher than those of the dealer catering to the regular retail store trade. The erratic fluctuations in patronage in even the medium priced restaurants, due to holiday migrations, weather changes and other factors, introduce elements of risk and wastage which tend to keep the margin high.

Public control over food distribution has rapidly extended in some fields and has contracted in others. In the United States there has been a steady extension of government supervision over food dealers to protect the consumer by the maintenance of health standards and to regularize the trade through establishment of commercial standards and the restraint of fraudulent practises. There has been relatively little governmental price control except during war emergencies. However, government control over maximum rates charged by rail and water transportation companies and terminal agencies, such

as stockyards, has become an accepted policy. The antitrust laws have been applied to prevent the distribution of diverse food lines by the big meat packers.

Actual public participation in food distribution has been confined, with a few exceptions during war time, to the operation of municipal markets for the accommodation of farmers and retail dealers and an attempted use of the police power to prevent the racketeering invited by the present disorganized state of the industry. There are several notable examples of successful farmer market operation by municipalities, although the Bronx terminal market for the receipt of railroad hauled produce, constructed by the city of New York, plays a very unimportant part in the distribution of foodstuffs. The interdependence of terminal markets and railroad operation has made control of terminal facilities by municipalities much more difficult than in the days when farmers and housewives met to transact business in a plaza market.

W. P. HEDDEN

Food Distribution in Western Europe. Most European countries have a long tradition of government supervision and direct intervention in the processes of food distribution. Concern over adequacy of supply early caused the establishment of public granaries and led to stringent regulation of trade, quality and price. But the laissez faire impetus of the French and the industrial revolution gradually cleared the ground for the private exploitation of the food industries. At the present time the mechanisms of food distribution are as varied and as highly specialized in western Europe as in the United States. The international wholesale trade in exotic wares and plantation products, the first of the important food trades, has in recent years been vigorously developed and augmented by trade in grains, refrigerated meats and dairy products and fruits. In the period before the World War the local middlemen who gathered produce from the farms for redistribution to the rapidly growing cities increased in importance. In recent decades the functions of the city retailer have been growing more varied and more complex, while the costs of his services have been growing proportionately heavier because of the greater demands made on him by the consumer no longer willing or able to do the greater part of his shopping at the street market or fair.

In general, lines of distribution follow similar channels in the leading industrial countries.

But Germany may be said to show the most thorough group organization, England the greatest variety of middlemen and France the greatest centralization of wholesale trade and at the same time the greatest dependence on the primitive street market for its retail trade. Sweden is worthy of notice as a country in which consumers' cooperative societies have an almost complete monopoly of food distribution.

Almost universally the central fact in the city distribution of perishable foods is the municipal market (*see* MARKETS, MUNICIPAL), where the whole supply of one or more types of food is offered for sale to wholesalers, to retailers and sometimes even to consumers. The Halles Centrales of Paris, the oldest and most inclusive of these modern markets, sets the price for perishable goods all over France. It is regulated by municipal and departmental authority and goods are sold by official *mandataires* on a commission basis. In Great Britain there is little public regulation of sales, although the Smithfield meat market and the Billingsgate fish market are owned by the city of London. The privately owned Covent Garden is notoriously inefficient as a distributing center for fresh fruit, vegetables and flowers. In Germany, on the other hand, the system of public markets is well developed. Berlin has excellent markets equipped with good railroad connections and served by municipal salesmen and auctioneers.

Organization of individual branches of the food trades varies from city to city and from country to country. Certain operations are purely local, others international in scope. There is not space here to deal with trade in such staples as sugar (*q.v.*), grains (*q.v.*) or tea and coffee (*see* PLANTATION WARES), except to note that in so far as they are imported into Europe London is the wholesale center not so much for their actual distribution as for their sale on her produce exchanges and for the discounting of bills originating in such trade. Hamburg is an important redistributing center for imported foods destined for central Europe. Billingsgate and Hamburg are the chief salt water fish markets for the rest of Europe, while Paris and Berlin are the leading centers for fresh water fish.

The meat distributive trades reflect in all countries and in varying degree the competition between domestic meats and imported cold storage products. For Great Britain as a whole 50 percent of the meat is home killed; but for London the proportion, including that sent from

Scotland and Ireland, is only 30 percent. Home killed cattle are usually sold at local auctions directly to the small local retailer, who himself slaughters at private abattoirs. It is only in the larger cities that municipally owned abattoirs and wholesale markets have been established. Smithfield, the center for the imported cold storage trade, represents the opposite extreme of centralization. There the American and Argentine meat packers sell to jobbers and retailers supplying the London trade and much of the interior. One of these, the Union Cold Storage Company, Ltd., itself controls 3000 retail units throughout the country, a development viewed with alarm by the 45,000 independent meat retailers. Cooperative slaughterhouses and butcher shops are of considerable importance and are operating on a large scale with marked efficiency. Their net profit on turnover in 1924, as reported by the Royal Committee on Food Prices, averaged 10.1 percent as compared with 5.5 percent for the independent retailers. It is interesting to note that 80 percent of the meat sold by the cooperatives is home killed, whereas the small scale private retailer can assure himself of variety and standard quality only by buying imported meat. Berlin imports only 20 percent of its meat supply. There as well as in Vienna slaughtering at municipal abattoirs is compulsory. Interesting developments in Vienna include the organization of the Wiener Vieh und Fleischmarktkasse and of a company to run retail stores selling meat at cost plus 5 percent.

The wholesale distribution of dairy products and eggs in most European countries likewise reflects the influence of imports from large scale producing organizations, many of which are co-operatives. England and Germany are the principal importing countries. British wholesalers import eggs from the cooperatives of Denmark and Holland; from Belgium; and from Egypt and China, where British agents sometimes superintend the collection; from the packers in the United States and Canada; from the Overseas Farmers Cooperative Federations in Australia and New Zealand; and from local shippers in South Africa. Domestic eggs are seldom handled by English wholesalers; local retailers procure them direct from the producer. The same applies generally to butter. Cheese also is largely an imported product, the main supplies coming from New Zealand and Canada. Germany, on the other hand, draws her dairy supplies largely from the cooperative producers' societies of

northern and eastern Europe. Except for the co-operatives, which are virtually the only important independent producers of dairy products on the continent, the trade is organized by cartels and strong combinations. Cheese exported from Switzerland is controlled by the Käseunion cartel. Margarine, used extensively in Europe as a butter substitute, is almost completely controlled by the international Unilever trust; in countries protected by margarine tariffs the trust has built its own factories and absorbed its competitors. The importance of this to the consumer is increased by the fact that resale price maintenance of trademarked goods is legally protected in Europe.

Trade in fresh fruit and vegetables is centralized for England and France in the Covent Garden market and the Halles Centrales respectively. The larger German cities are well equipped with wholesale markets, but there is no one distributing center for the country as a whole. *Aufkäufer*, buying from the farmers, are strongest in the south and west. British trade in fresh fruit and vegetables is outstanding for the variety of intermediaries involved. From sixteen to twenty handlings were reported as common in 1924 by the Committee on Distribution and Prices of Agricultural Produce, known as the Linlithgow Committee. This was partly the result of the practise of reconsigning goods by way of Covent Garden to the provincial wholesale markets.

It is difficult to secure for European countries figures comparable with those compiled by the United States Census of Distribution which would give an accurate picture of the organization of retail distributive agencies. For Great Britain the nearest approach is probably the record of the registration of consumers for ration purposes during the World War. At that time 23 percent registered with 5500 cooperative stores, 23½ percent with 7000 branches of chains, 53½ percent with 137,000 independent retailers. At that time three chains controlled over 2000 retail outlets and the number owned by this small group is increasing rapidly. It is estimated that the 1400 consumers' cooperative societies handle one third of the food consumed in Great Britain. The cooperatives have their own slaughterhouses, bakeries, margarine and soap factories. They import plantation wares and wheat and operate fruit and dairy farms—all most advantageously. But competition is becoming keener. Apparently the Civil Service Cooperative Society, Ltd., prompted the early

chains. Lipton, who started as a provision merchant in 1876, added tea to his line in 1889 and the company expanded rapidly thereafter. There are now important meat chains, Mac Fisheries, Ltd., with its own fishing fleet, Lyons and Co., Ltd., the Aerated Bread Company, Ltd., and general grocery chains. In London the large department stores are important distributors of food. In the smaller towns, however, street markets and fairs are still significant and there is considerable direct distribution of dairy products. In its final report on the problem of food distribution and production in Great Britain the Linlithgow Committee advocated, as needed improvements, standardization by trade associations and producers' associations of products and of weights and measures, the revision of railway rates, promotion of car lot shipments, better roads and lower parcel post rates. The report of this committee indicated its belief that in England the future for the wholesale trade is undoubtedly with the big unit; it condemned the wastefulness of small retail units but considered that the consumer was largely to blame because he persisted in dealing with many traders and in demanding too much in the way of style and service, including the delivery of infinitesimal quantities of goods. The report recognized, however, that the habits of consumers with respect to style and service were too ingrained to make practicable in England municipal retail markets of the continental type.

Whereas the English wholesaler still plays an important role in the distribution of groceries and general food products, in Germany the competition of chains and of cooperatives and the special position of trademarked goods are limiting the wholesale field and will soon eliminate the small wholesaler entirely, according to the opinion of the Enquête-Ausschuss on German economic life. A considerable proportion of the goods carried by grocery wholesalers in Germany is imported, in the case of large dealers directly from abroad. The importance of the Hamburg market is indicated by the fact that certain English goods which before the war were sold directly to retailers can now be secured only through the Hamburg importer. Goods in transit to be processed and reexported form from 5 to 37 percent of the trade of importing houses. On the average, standard brands account for from 10 to 20 percent of the wholesale grocer's trade; for smaller houses they may be even more important.

Independent retail distributors of food have

apparently been increasing in number in Germany since the war and competition is consequently keener. The new small proprietors are drawn from those now unable to make a career in the army, from ex-soldiers or from dismissed officials. Such independent retail dealers have formed various associations to strengthen their purchasing position. The most important is the Edeka (Einkaufsgenossenschaft Deutscher Kolonialwarenhändler), which has some 250 local branches and total yearly sales of almost RM 200,000,000. The Edeka has its own trademarked brands, but its principal function is to buy for its members from manufacturers in quantities large enough to entitle them to the maximum discount. Its administrative expenses, however, in certain cases are so high as to nullify a large part of its advantages except to the small dealer. About 30 percent of its sales consist of cartel controlled goods, 15 percent of trademarked goods and most of the remainder of so-called competition articles—flour, sugar, eggs and the like.

Cooperation plays almost as important a part in supplying the public with food in Germany as it does in Great Britain. Societies belonging to the Zentral Verband operate 10,000 stores, 70 to 90 percent of whose sales are food products. The larger societies themselves produce most of their goods and the smaller buy from the central wholesale bodies. The development of their own trademarked brands has made them almost independent of the cartels. They use little credit, buying directly from the manufacturers and from producers' cooperatives. Certain societies have established joint buying days in order to reduce freight charges and the like.

Chains are playing an increasingly important role in German economy as in England and France; in general they lessen the importance of the wholesaler in the food trades more than that of the retailer. Of four general grocery chains examined by the Enquête-Ausschuss, two, with yearly sales ranging from RM 8,400,000 to RM 12,800,000, had established a joint purchasing office and an agency abroad. But they bought their vegetables from wholesalers because the wholesaler by sorting them guaranteed better quality; but they bought from wholesalers or from the dairy. These two companies gave no rebates to their customers and were unaware of any price agreements in their territory. The other two chains, however, had been forced by cooperative competition to give rebates to customers and had made agreements with the co-

operatives against price cutting, particularly on sugar. To represent their political interests the chains have organized the Reichsverband Deutscher Zweiggeschäftebetriebe im Lebensmittelhandel, to which the great majority belong. Fifty-five of the smaller firms controlling from 2500 to 3000 retail units and with yearly sales totalling RM 250,000,000 to RM 300,000,000 have organized the Einkaufsgesellschaft Deutscher Zweiggeschäftebetriebe im Lebensmittelhandel to get the highest rebates on trademarked goods. While German chains selling food products are not accused of price cutting, the department stores are. It is claimed that they use their food departments merely as a bait to get customers into the store.

Another type of distributive agency which is of particular importance in the industrial regions is the company store. One of the largest of the sixty-five corporations conducting stores (presumably Krupps), with 118 branches, reported sales in 1926 of RM 40,000,000—equal to one third of the wages bill. Groceries constituted 69 percent of the sales; textiles and shoes, 29 percent. Over one quarter of the food is of its own processing, especially meat, bread and flour. Other goods are bought direct from the producer. They are sold at cost or at cost plus 5 percent; on account of cooperative competition a rebate of 5 percent is paid to consumers at Christmas. Most of the company stores, however, buy their trademarked goods through the cooperative Vereinigte Werkskonsumanstalten, G.m.b.H., which was organized in 1922, during the compulsory period, to get sugar and the like on the same terms as the consumers' cooperatives.

Since the latter part of the nineteenth century a growing realization of the importance of guaranteeing the food supply of the urban consumer, with regard to both quality (protection from disease and from adulteration) and price, has occasioned the revival of government supervision of the food trades. The movement reached its climax during the World War, when government control and even government operation of many branches of the food industries became almost universal. Although such control was relaxed when more normal conditions were reestablished it has not been abandoned. Publicly authorized bodies in France and Germany can establish fair prices for various necessities, and Great Britain has passed a bill giving the Board of Trade greatly increased powers of investigation and control.

INEZ POLLAK

Food Distribution in Russia. In pre-war Russia the problem of food distribution was comparatively limited in scope. Except in periods of famine, when public relief was necessary, the overwhelming mass of the rural population subsisted in the main on locally grown breadstuffs supplemented by potatoes to a varying degree depending upon locality and the relative prosperity of the household. Because of sales in the autumn forced by the need for ready cash, purchases of grain during the winter and spring by a great part of the peasantry had become an essential element in the village economy even in the regions with a grain surplus, but these did not involve any processes extending beyond the home village or nearest country town. The limited demand for meat, vegetables and dairy products was supplied locally to an even greater extent; salt, tea and sugar were practically the only articles for which the peasant was dependent upon a broader market.

With the increase in the number and size of cities a domestic grain trade developed out of the earlier export trade. The primary problem here was that of reaching out into the country for whatever portion of the crops could be secured from large numbers of greatly scattered producers, including millions of peasants and village traders. A vast army of small dealers, operating independently or to a small although increasing extent as agents of large firms or commercial banks, collected and shipped small lots of grain, perhaps a carload or two at a time; having no working capital, they operated entirely on credit and were interested primarily in a rapid turnover.

Geographically the most important movement was that from the grain producing sections in the south and east of European Russia to the consuming areas in the north and northwest and also to the industrial centers within the producing areas. The rush on the part of producers and dealers for immediate disposal of the grain, the lack of country elevators and the miserable condition of the country roads, which were the weakest point in the grain movement, caused a strain on the railways and resulted in annual congestion and the accumulation of stocks of grain on railway platforms. The uneven distribution of railway facilities, with about two thirds of the mileage concentrated in the west in about one fourth of the area of European Russia, was becoming an ever more serious handicap to the grain movement as the importance of the agricultural output of the eastern sections on both

sides of the middle Volga increased. Water transportation played a secondary part; the most important movement was up the Volga, to and from the large flour milling centers along the river, which supplied about one fifth of the commercial output; but low waters in the summer and the early advent of winter interfered with its development.

The local markets, fairly important even for the grain trade, played an even larger part in the distribution of other agricultural produce. Only the two capitals and a small number of other leading cities derived the bulk of their meat supply from large scale receipts of cattle fattened for the market in the south and east; they also received shipments of fruit, vegetables and dairy products from distant regions. Elsewhere local markets were the primary source of supply. In 1913 less than 25 percent (including meat in terms of live animals) of the total number of cattle slaughtered were transported by rail; for sheep the proportion was less than one eighth. Since there were virtually no cold storage facilities or refrigerator cars, long distance movement of perishable goods was very limited. Butter shipped by rail for domestic consumption amounted in 1913 to about 150,000,000 pounds. Nearly one half of the milk supply of the two capitals and a large proportion of other dairy products were provided by a few large firms and procured from suburban farms, while the rest came from peasant deliveries, which constituted almost the sole means of distribution in other cities. By far the greater part of the vegetable supply came from suburban sources.

The old forms of distribution were destroyed in the course of war and revolution. The successive army drafts and the growth of the urban population produced within a very short time a tremendous marketing problem. The railways, inadequate from the earliest stages of the war to meet the food requirements of the industrial areas, taxed beyond capacity by the movement of troops and army supplies in the same western and northwestern direction, steadily deteriorated after the confusion of the retreat and evacuations of 1915; their complete collapse after the revolution accelerated the disruption of interregional intercourse. In the years 1918 and 1919 the occupation of the Ukraine, first by German troops and later by the White armies, and the civil war in the southeast, the Volga region and later in Siberia cut off the greater part of the productive agricultural area from the Soviet Republic. The intraregional exchange relations

between city and country were equally disturbed as the incentive for selling their produce diminished with the increasing money revenues of the peasants and later vanished completely because of the scarcity of manufactured goods. By 1920 all regular markets had disappeared and the economic ties between the several regions had completely disintegrated.

Beginning with the autumn of 1915, the shortage of food in the cities had led to public intervention in the marketing process. Local municipal and military authorities enforced the rationing of scarce food articles, the regulation of the prices of essentials and local export embargoes on specified products. Even such measures as direct sales of certain articles by public bodies, the provision of food to employees in munition plants by the army administration and to workers in other establishments by the employers were not uncommon before the revolution. Local effort, however, was poorly coordinated and there was a bewildering variety of rationing and price standards and of methods of enforcement. Measures designed to secure greater uniformity were enacted by the Provisional Government, but it was unable to make them effective because of the steady deterioration of the transportation system and chaotic political conditions. In the following period of war communism organized distribution became the most essential function of the state. A rigid and uniform system of distribution based upon consistent class discrimination was administered in accordance with a central plan by the local agencies of the Commissariat of Food Supply working through the medium of consumers' cooperatives, which had been transformed into distributive organs of the state with membership made compulsory.

The gradual extension during the war of government purchases of produce, particularly grain, marked the beginning of those concentrated acquisitions from the producers which have continued in one form or another ever since. The basic unit of the government purchasing machinery was the country "delivery point," where the grain is received from the producers of the surrounding countryside, thence to be taken to railway stations or river ports for shipment in large lots; all the later systems of public grain purchases have more or less followed this arrangement. Private grain trade, which was progressively curtailed from the beginning of the war, was abolished by the "grain monopoly" act of March, 1917, under which all agricultural sur-

pluses in excess of the fixed requirements of the producers were to be delivered exclusively to public food supply agencies at fixed prices. Yet the grain monopoly was not fully carried out until 1918, when the systematic aid of armed force was called into play and committees of the "village poor" had been set up to assist the agencies of the Commissariat of Food Supply in requisitions from the richer peasants. Manufactured goods, whenever available, were offered in exchange for agricultural produce to communities rather than to individuals, the manufactured articles being distributed among the village poor in payment for products requisitioned from the *kulaks*. These exchanges were almost entirely in the form of barter; it was not permissible to pay in cash for more than 15 percent of manufactures delivered to a community. In addition labor organizations were authorized to send armed detachments of workers into the country to requisition foodstuffs, the supplies thus obtained being divided equally between the commissariat and the respective organizations which received the food as part of the quota allotted to them.

While the methods of war communism were substantially effective in extracting food from the producers, the condition of the railways and the appalling chronic shortage of food interfered with interregional distribution according to the general plan. Nor did the state agencies succeed in supplying fully the demands of the city population, even at the miserable standards of those times. Thus in 1918-19 they provided only about 46 percent of the total bread supply of the urban centers in the grain producing areas and approximately 38 percent in the consuming areas; even in 1920 they supplied less than 60 percent of the urban consumption for the country as a whole. The rest was secured by a variety of scattered individual transactions known as "bagman's" trade. The bagmen—petty traders, peasants trying to barter their produce against needed articles in the city or at the source of production or city consumers going out into the country to barter valuables, old clothes, textiles and similar articles for food—first emerged before the October revolution; but they became much more numerous as the rigors of war communism increased. Bagmen's trade, although alternately suppressed with extreme severity and allowed a fair degree of freedom, while overtaxing the meager transportation facilities, interfering with planned distribution and adding to the general chaos, nevertheless played an in-

dispensable part in the food supply of the cities.

The restoration of the market as the medium of distribution was one of the principal objects of the New Economic Policy inaugurated by the act of March 21, 1921, which abolished the grain monopoly and substituted for the requisitioning of producers' surpluses a food tax payable in kind. The restoration was at first but a partial one, as the food tax was designed to serve as the chief source of city supply. Although assigned a subsidiary role in the food supply, the private food market began to expand as soon as the direct sales by the peasantry were resumed; and successive enactments allowed greater latitude to private trade. With the remarkably rapid rehabilitation of the railways the movement of goods on a nation wide scale was soon reestablished. With the stabilization of the currency, completed in 1924, the substitution of an agricultural tax payable in money for the food tax, the abolition of the Commissariat of Food Supply and the restoration of national economy as a whole to a monetary basis food distribution came to consist of a series of commercial transactions.

At no time, however, has distribution under the Soviet regime reverted completely to pre-war forms. Since the functions of public bodies as agencies of distribution had never been abandoned, state and cooperative organizations had a substantial share in the commerce of foodstuffs even in that initial three-year period of the New Economic Policy when they operated practically on a basis of free competition with private trade. Beginning about 1924 public agencies began to reassert their leadership and an aggressive policy of restriction of private trade was adopted, designed to bring about an extension of state planning and regulation of the food supply and a gradual socialization of distribution, chiefly through the agency of the cooperatives, which had become voluntary organizations operating by commercial methods. With the aid of such weapons as its general administrative and taxation powers and control of large scale industry, credit and transportation the state succeeded in subsequent years in greatly reducing the share of private traders in the turnover of foodstuffs. In 1928 by far the greater part of the commercial grain crop was handled by public agencies under a system of concentrated purchases at fixed prices. Some of these agencies were state controlled, but a growing proportion of them were cooperative organizations. There had been a similar, although belated and limited, extension of the share of planned public purchases of meat.

dairy and poultry products. Also at the distribution end there was a steady expansion of the operations of public agencies, especially those of consumers' cooperatives.

Socialized trade was supplemented, however, by private trading, which became increasingly precarious, and by purely local transactions, which were neither regulated nor planned. Except for export, army and state reserve grain more than 35 percent of the commercial grain crop of 1927 still passed through private channels. About two fifths of this amount was represented by peasant sales in town bazaars and the remainder by purchases in the country by private traders. The importance of deliveries from suburban points and of direct peasant sales of milk, eggs, vegetables and especially meat had become even greater than before the war; and in the regular wholesale markets private traders still transacted in 1928 over one half of the total meat sales of the entire country, about 50 percent of the butter trade and about one third of the egg trade. Practically all of the fruit and vegetable trade was in private hands. In retail distribution private trade had continued to grow in absolute size, and even its relative importance had remained large not only in the turnover of such articles as were produced or processed in private establishments, comprising about one third of the total capital invested in food industries, but also in the distribution of such products of state and cooperative industries as sugar, salt and tea, which the public agencies were not equipped to handle fully. There had thus developed a dual market, with a dual range of prices: a cumbersome and slow moving cooperative machinery and, partly competing with it and partly supplementing it, a profiteering private trade; in addition there was of necessity much dependence upon scattered local movements and transactions. It was an essentially unstable and unreliable system causing violent fluctuations in the food supply and in the workers' consumption budget, but until the grain crisis of 1928 it involved no general shortages so acute as to necessitate rationing.

Since the launching of the Five-Year Plan in 1928 distribution policies have been blended with the program of socialization and enhanced industrialization. The very problem of distribution has assumed new aspects in regard to scope, geographical trends, technical equipment and methods. The Five-Year Plan anticipates an increase of 23 percent in the urban population. The expansion of old industrial centers has been

accompanied by a mushroom growth of vast settlements at the new projects under construction and by the rise of new industrial regions. The program of agricultural transformation involves a high degree of specialization, carried to the extreme in the state operated grain farms (*sovkhozy*) and to a smaller extent in the collective farms (*kolkhozy*). Regional specialization in agriculture is also projected and carried out on a scale which means a complete recasting of the agricultural map of the country. It was estimated that as a result of this specialization peasant purchases of grain through the market would increase twofold in the course of the five-year period. The building up of large scale farming also implies a change in the methods of procuring agricultural produce.

The actual situation in the past few years has been greatly complicated by the overthrow of old social relationships incident upon the application of intensive revolutionary effort to the reconstruction of industry and agriculture and by the acute shortage of food. Food rationing was reintroduced in 1928 and applies now in one form or another to all essential foodstuffs. It is based not only on the general principle of class discrimination but also on an elaborate schedule of preferences for the benefit of individual industries, localities and plants of momentary crucial importance and of groups of workers to whose labor performance special value is attached, such as "shock brigades." Because of the food shortage and of the feverish promotion of agricultural exports an immediate increase in the volume of commercial crops became necessary; and the collectivization of agriculture was thus stimulated at a much faster pace than was anticipated. The struggle for the extermination of the *kulaks* and its counterpart in the cities, the renewed drive against private trade, have resulted in the destruction of many of the former channels of food supply and distribution. Marketing processes which had been established under the NEP have been suddenly displaced by a system of organized distribution, whose technical apparatus has been lagging behind requirements. Emergency situations have been constantly arising, calling for departures from general plans and policies.

The central agency of food supply and distribution is now the Commissariat of Supply, created in 1930. It has charge through its specialized constituent bodies of the construction and operation of state controlled food processing industries, including the large scale projects now

under way in meat packing, canning and preserving, which are expected eventually to become the basis of modernized distribution. It also plans and directs the acquisitions of grain, cattle and to some extent of other agricultural produce; this planning has now become specific and direct, so that individual villages are assigned their quota of deliveries. At the other end the commissariat controls the allotment of the food supply of the cities, industrial settlements and construction camps, that of the non-agricultural portion of the rural population and a substantial part of the supply of specialized agricultural producers, such as workers on state farms and cultivators of industrial crops. Cooperative organizations, while preserving their autonomy as agencies of organized producers and consumers, have become at the same time organs of planned distribution and as such operate under the supervision and direction of the Commissariat of Supply and in conformity with the plans laid out by it. While consumers' cooperatives have been assigned the leading part in distribution, the procurements from producers have now become for the greater part a function of agencies of agricultural cooperation, of which the most important is the Khlebozhivotnovodtsentr. It has charge of procuring grain and cattle from the villages and collective farms, which it turns over to the agencies of the state. Its role has grown with the great extension of the practise of "crop contracting," which now applies virtually to all collective farms and to a growing number of peasant groups; it was expected that 85 percent of the commercial grain crop would be secured by this method in 1931. Instead of providing for consumption goods in exchange for a share of the prospective crops the contracts now call for the supply of production goods.

There has been a complete change in the methods of acquiring agricultural produce. While the "extraordinary measures" of coercion resorted to early in 1928 were repealed later in the same year, free peasant trade has never since been restored and a measure of pressure has been attendant upon the process of procuring agricultural products. To make sure that the *kulaks* supply their assigned quotas, that the collective farms and peasant groups live up to their obligations under the contracts, and to induce them to deliver exclusively to the state the greatest possible portion of their crops in excess of those contract deliveries "civil effort" is enlisted. This has been supplied by local village Communists and members of Communist

Youth, by shock brigades delegated from the cities, by the village Commissions of Aid to Grain Procurements elected by the local "poor and middle peasants" and finally by the machine and tractor stations. The latter are in direct touch with the producers in the field and secure for the state agencies the part of the crop turned over to them in payment for their services; they have also been following the practise of stipulating in the contracts that producers are not to deliver any portion of their crops to private traders.

With the rapid increase in the size of the commercial grain crop its movement from producing areas to consumption centers, which has been expedited to an even greater extent than before the war, encounters considerable difficulties in regard to transportation and storage. The provisions of the Five-Year Plan for the improvement of transportation facilities were inadequate even for the original requirements of the plan. Since then the railway system, particularly its rolling stock, has been overtaxed by the enormous increase in freight caused by industrial and agricultural expansion. While the construction of the Turkestan-Siberian railroad stands as a positive achievement, little has been either planned or accomplished in regard to the old problem of improving facilities for the movement of grain from the producing areas in the east, which has in the meantime been aggravated by the importance assigned in domestic supply to grain from the Urals, Siberia and Kazakstan. Water transportation is still far below the pre-war level. Although there has been some construction of roads to connect the large state farms with railway stations, local transportation on the country roads is still the weaker link of the grain delivery system.

The problem of grain storing has been a serious one since the large scale government purchases during the war, when only port and terminal elevators were available. Since 1925, when the construction of country elevators was first begun, facilities have been greatly increased. Country elevator construction, which under the plan was to secure a total capacity sufficient to accommodate 50 percent of the commercial crop by 1933, has been since expanded and in addition hundreds of warehouses have been hastily constructed at the country "delivery points" by the grain producing organizations. The total warehousing capacity is still insufficient, however; only some 15 percent of it is in mechanically equipped elevators, and the other warehouses are often defective or inconveniently

located. Many of them become obsolete and are being discarded; so also do many "delivery points" of the old type, as concentrated deliveries by collective farms or by "red caravans" of peasant groups are becoming more important. A recent tendency has been to promote direct deliveries to railway stations, necessitating a hasty endeavor to extend the warehousing capacity available there. Construction of elevators at state farms has barely started; these were not called for by the plan but have proved necessary in view of the transportation difficulties encountered in 1930.

The distribution of other foodstuffs was hampered by the technical deficiencies of the apparatus as well as by other factors. Of these the most disturbing has been the wholesale destruction of livestock by peasants (no less than one third of all animals and fully 50 percent of hogs) during the excesses of forced collectivization in 1929 and 1930. Pending the execution of the far reaching program of reconstruction of animal husbandry on the basis of large scale farming, with a rational distribution of animal raising for meat in accordance with the needs of the projected meat packing industry, the meat supply of the industrial centers has been unbalanced. To relieve the shortage long haul shipments have become necessary on a scale never anticipated; this is particularly evident for shipments of cattle and sheep to the Moscow region from the Caucasus, Siberia and Kazakstan in substitution for hogs from central Russia and the Ukraine.

An analogous situation has developed in regard to dairy products and vegetables. The large suburban dairy and truck farms of pre-war times had never been restored, and the peasant farms which flourished during the NEP, fair sized establishments employing hired labor, went under in great numbers in the drive against the *kulaks*. While the long term program of development of large scale vegetable farms in the industrial regions is under way and while an effort has been made of late to concentrate upon suburban development, the cities are still dependent upon distant regions for their vegetable supply to a greater extent than ever before. Although a great effort is being made to build up a system of cold storage warehouses and refrigerator cars, such construction is still in the initial stage. In addition the facilities for sorting, handling and distributing perishable products are very scanty, so that their movement is in a very precarious condition.

In the distributive trade the task of consumers' cooperatives as originally contemplated under the Five-Year Plan consisted essentially in extending, improving and modernizing facilities of retail trade, lowering costs and prices and securing an elasticity of methods in conformity with the great variety of local needs. The chain department store was set as the basic unit, and this has tended to become the predominant type of organization. In the rural sections it is a district store supplied from a regional warehouse, with branch stores in individual villages. In the cities in addition to the general department stores district department chain stores have received most attention; these include both general and special stores—particularly, specialized food stores—as well as a net of stands, tents, kiosks and traveling stores, especially in outlying factory sections, at railway stations and docks. The cooperatives were expected to bring about a radical improvement in the internal organization of the stores, to develop the practise of home delivery to consumers and to secure a gradually increasing control over the trade in the town bazaars, especially in provincial cities, with a view to transforming them eventually into modern markets. It was anticipated that in the course of the five-year period they would attain a dominant position in retail distribution; their share in the total retail trade was to advance from 57 to 76 percent, while that of private trade was to decline from 25 to 9 percent. Retail trade of state controlled organizations, with an increase of 38 percent in absolute volume, was to play a subsidiary and gradually diminishing part. A particular effort was to be exerted in expanding cooperative activities in food retailing; agricultural products were to increase from 30 to 40 percent in the total turnover of urban cooperatives. The program also provided for an expansion of the productive activities of consumers' cooperatives. Cooperative baking, which had supplied from 60 to 90 percent of the consumption in the larger cities, was to be extended so as to cover fully the supply of all cities with a population of over 100,000 and up to 75 percent of that of cities of 50,000 to 100,000. This was to be accomplished largely through the construction of more "bread factories," with the gradual elimination of the more obsolete old type bakeries. There was also to be a great expansion in the field of public feeding; the cooperatives were to establish restaurants, cafés and public kitchens dispensing prepared

meals for home consumption, school luncheons and the like.

A program of this magnitude, requiring so high a degree of initiative and flexibility, was imposed upon the consumers' cooperatives, which were handicapped by a scarcity of trained personnel and a poorly developed apparatus. They were not prepared to carry out even the original program; still less were they able to cope with the problems of the past few years, which have altered and complicated their task and changed their position in the economic system.

As a result of the forceful suppression of private trade instead of its gradual elimination as had been planned the demand upon the cooperatives has increased more rapidly than was anticipated. Practically all private stores in the cities, including food stores, have now been closed. There has been a sporadic revival of bagman's trade, alternately tolerated and suppressed, expanding and contracting. Peasant sales in the bazaars, while not prohibited directly, have been checked to some extent by the danger they imply for the peasant of affecting his official status in regard to class allegiance. The cooperative organizations, suddenly placed in a quasi-monopolistic position, have thus far proved inadequate to substitute effectively for the various private agencies, especially in the supply of perishable articles.

The requirements of stricter control arising from the food shortage and the system of rationing have brought about changes in the methods and structure of consumers' cooperatives. In 1928 sales to non-members were restricted and consumers were assigned to specific stores; in 1930 there were established "closed workers' cooperatives," exclusively attending to the supply of workers at individual plants; factory stores have been actively promoted, designed not only for the stricter enforcement of the "class principle" in distribution but also to provide for a partial elimination of money in the payment of wages. A parallel development has been the provision of dining halls at individual plants.

The problems of food supply arising from the growth of construction camps and new industrial settlements have assumed proportions never anticipated before. The situation under conditions of general food shortage has had to be met by emergency measures, with a great deal of improvisation both in regard to retail distribution in general and to the development of public feeding in particular. The latter, originally regarded as a phase in the gradual socialization of

communal life, has become a problem of first and most urgent necessity in the new settlements. It has also assumed an unexpected importance in the cities and old industrial centers, since the laboring population has grown out of all proportion to the meager housing facilities and since many women have been enlisted in industrial work. The failure of the cooperatives in the field of public feeding led in August, 1931, to a transfer of these functions to the organs of the Commissariat of Supply in the most important centers.

Of all Soviet organizations consumers' cooperatives have been the slowest to adapt themselves to a situation full of emergencies and calling for a great capacity for manoeuvring. Denunciations of their lack of militant initiative have become common. Their failure has been officially stated more than once, and it has caused in the past few years several programs of general reorganization to be enacted, which, however, have been slow to materialize; the deficiencies of technical equipment have been the chief obstacle. The latest reform, that of May, 1931, calls for the reorganization of the *Centrosoyus*, the central union of consumers' cooperatives, into a body of specialized agencies composed of wholesale trade concerns operating on a strictly business basis; these include, as far as the commerce of foodstuffs is concerned, three wholesale concerns dealing respectively with groceries, fruit and vegetables, and dairy products. In the several constituent republics and regions central retail concerns are to be established, likewise with specialized functions; they are to handle groceries, fruit and vegetables, dairy products, meat and poultry, pastry and confectionery goods and the food supply of children; all existing specialized food stores have been transferred to these concerns, and they are required to build up a system of shipping and warehousing of their own.

The same order confirms and extends the functions of consumers' cooperatives in procuring and processing agricultural produce for the supply of their members, either through acquisitions from producers or through the development of suburban farms of their own. These activities, not contemplated originally, have been gradually growing in importance. Over 300,000 hectares of suburban lands were planted to vegetables in the spring of 1931 by various city and regional unions of consumers' cooperatives. The object of this effort, however, was largely defeated by the general unpreparedness of the

organizations to handle the crop, by the lack of warehousing and shipping facilities and by the absence of provisions to finance their construction.

There is every indication, however, that a growing reliance will have to be placed upon the consumers' cooperatives for a large portion of the city supply. The shortcomings of centralized supply have caused since the spring of 1931 a distinct shift of emphasis from long term problems to immediate emergencies and from centralized planning to local initiative. Authority to purchase directly from producers all over the country and to build up suburban farms of their own, conferred at first upon the several regional and city cooperative unions, was later extended to the workers' cooperatives at individual plants and in August, 1931, to the several public feeding units in industrial centers. State controlled vegetable farms have been directed to contract directly with workers' cooperatives for the sale of their products, and the state grain farms have been advised lately to depart from the practise of exclusive specialization and to build up on their grounds such other forms of farming as may be required for the supply of their own workers. A number of conflicting cross currents have come to the surface since these departures, as keen competition has developed between the agencies of the central authorities and those of local organizations.

FOOD SUPPLY. In every age, with perhaps the exception of the present, the problems of food and food supply have been serious matters of

public concern. The part played by food in the myths and folklore of primitive and early historical peoples is well known; the anxiety felt over the adequacy of the food supply is written into the legal codes of almost every society well into the nineteenth century. In prehistoric times the inadequacy of the food supply acted as a control on population growth; during antiquity the course of civilizations was largely shaped by the same problem; in the Middle Ages a desire for certainty as regards food helped form the institutional life of Europe. Only in modern times has this feeling of uneasiness been relaxed; today one of the chief distinguishing marks of civilization is the existence of a technological basis for an adequacy, if not a surplus, of food.

The leading reasons for this change are worth summarizing. In the last two hundred years the science of agriculture has made great strides as a result of crop rotation (with the presence of a legume in the rotation), intensive cultivation and the growing use of chemical fertilizers. The application of machinery to farming and to allied processes has hastened technological changes. The development of rapid transportation on both land and sea, the appearance of a world wide machinery for credit and exchange, the creation of land banks and other devices to make farm financing easier, have changed the production situation. Refrigeration, the opening of new grasslands to cultivation, first in the United States and then in Canada, Argentina, Australia and eastern Asia, and the development by irrigation and dry farming of areas possessing seasonal or inadequate rainfall have created new sources of supply. Since the beginning of the industrial revolution the world's population has grown at an extraordinary rate; yet, thanks to agriculture, transportation, credit and exchange, it has been fed comfortably and in some regions with a plenty which has been experienced before only on rare occasions and by the privileged classes.

Nevertheless, there continue to exist certain factors which, if they do not imperil the food supply of the world, make its status, particularly in separate regions, less certain than is commonly supposed. Undoubtedly the law of diminishing returns places barriers in the way of an ever growing application of capital and labor to the production of foodstuffs unless governments either resort to subsidy in order to assure the continuance of a farming class or else make food supply a state monopoly. Under the present

capitalist system difficulties of a financial nature, arising largely from the inability of many agricultural peoples to maintain their purchasing power, may affect the food supply. Natural threats to the food supply still function: droughts, floods, excessive moisture, insect pests, plant diseases. War as a destroyer of agricultural lands and as a disrupter of the mechanisms of transportation and exchange has its influence on belligerents and neutrals alike. Hidden hungers (scurvy, beriberi, rickets, pellagra and the like), due to dietary deficiencies, still carry off their victims. So great a future growth of the world's population as to tax seriously the land's power to produce the needed food resources is probably no longer to be regarded as a serious possibility.

Although the food supply of the modern world is plentiful, it can scarcely be said that all peoples enjoy diversification. At least 60 percent of mankind's diet is made up of grains—rice, wheat, rye, barley, oats, corn and so on. The remaining 40 percent must be divided among the legumes, sugars, vegetables and fruits, nuts and other oil producers and finally meats. The Orient subsists almost entirely on rice; the customary fare of many European agricultural laborers has been and is still largely rye bread. Fully half of the world's population eats very little meat; in fact, it has been estimated that the world's production of meat is by weight but one fifth of the world's production of wheat alone. In new countries where land is cheap or in sections of the world like western Europe where the standard of living is sufficiently high to permit of the importation of animal fodder, the raising of animals for food is economically possible. These factors help explain the large consumption of meat in countries like the United States, Canada, Argentina, Australia, the United Kingdom, Germany and Denmark.

Raymond Pearl (*The Nation's Food*, ch. ix) has found that the average annual use of food in the United States during the period from 1911 to 1918, in terms of caloric value, was divided into the following proportions: grains, 34.68 percent; meats, 21.63 percent; dairy products, 15.26 percent; sugars, 13.24 percent; vegetables, 5.32 percent; oils and fats, 4.82 percent; fruits, 2.20 percent; poultry and eggs, 2.02 percent; oleo-margarine, 0.42 percent; fish, 0.41 percent. Among the grains wheat led easily; among the meats, pork. The annual yield of food in the United States was 26,068,700 metric tons, making an annual per capita yield of 2.3 metric tons.

In terms of energy the average adult male American consumed 4290 calories daily as compared with the 3000 calories stipulated as adequate in the typical food chart and the 3358 calories consumed per man in the United Kingdom during the war year 1918.

The extent to which the modern world is dependent for its food supply upon the international mechanisms of transportation and exchange is revealed by an examination of the far flung distribution of the principal food bearers entering into commerce. It is true that the larger part of the world's food is produced in those lands where it is consumed; nevertheless, complete self-sufficiency on national lines may be said to exist nowhere and interdependence on a world basis is increasingly becoming the rule. Even Java, the Philippines and the Straits Settlements must import rice. Brazil, whose chief industry is agriculture, must import wheat and meats; the same is true of Cuba. A large part of the temperate zone is dependent upon the United States, Canada, Australia, India, Argentina, Russia and the Danubian countries for its wheat; Argentina exports corn; pre-war Russia exported rye and barley; Siam, Indo-China and Burma export rice; Cuba, Java, Hawaii export sugar; Central America exports fruits; Argentina, Uruguay, the United States, Australia and New Zealand export meats; the Scandinavian countries and New Zealand export dairy products. Because the processes of distribution function in general so competently, direct social and public interest in the food supply has been relegated to a minor place among the activities of government; but a review of the status of the food supply in earlier times quickly indicates that this attitude is entirely a characteristic of the modern period.

Ancient man sustained himself in a comparatively simple fashion: he ate what he could find and nature was his only provider. He hunted, fished, tracked down small animals and insects; he collected fruits, mosses, roots and wild honey. Not until late in his development did he learn to domesticate animals and till the soil. Nevertheless, whether merely gatherer of foods, hunter, shepherd and herdsman or agriculturalist, he quickly appreciated the necessity for storing and preserving food to provide for periods of inadequacy. Nor was the machinery of exchange unknown, as is evidenced by the presence of barter among primitive tribes today. That he did not want for food the survival of the race testifies; nor are there any indications that hunger and

famine were ever present conditions of living. This equilibrium was undoubtedly maintained largely by checks on population growth, most common of which were restrictions on sexual intercourse among married persons, abortion and infanticide. In early historical societies in order to check population growth and to feed settled communities there was to be found a survival of primitive customs existing side by side with conscious planning on the part of governmental bodies. Abortion and infanticide were generally practised throughout antiquity and indeed continued to exist in China and India until quite recently. In addition, governments assumed as one of their major functions the task of providing agencies to safeguard and distribute the food supply. In Egypt, China, Greece and Rome one or another of the following measures was always found necessary: the erection of royal granaries for purposes of storage against lean harvest years, the encouragement of colonization for the purpose of opening new agricultural areas, military conquest to assure the steady flow of agricultural imports, the equipment of navies to convoy the grain ships or even monopolization by the state of the handling and distribution of grain. Despite the lavishness of nature, as in the case of the Nile; despite the widening of the area of supply, as in Greece; despite the greater agricultural skill of man, as in Rome, where crop rotation came to be practised, the threat of hunger was always real and the adequacy of the food supply had always to be considered. The decline of many early historical societies was due in no small degree to their inability to solve successfully the problem of food supply.

In Egypt royal granaries were early established, and the role of the collector and controller over the surplus grain of the kingdom has been made familiar by the Biblical story of Joseph. In China as early as the fourth century B.C. not only did the government maintain granaries for the storing of surpluses but it also inspected and graded the rice crop and fixed prices. In Greece and more particularly in Attica, where a primitive pastoral and agricultural economy had evolved into a metropolitan one, preoccupation with the food supply had become the leading concern of statecraft by the fifth century B.C. Colonization in Asia Minor, Sicily and Italy was encouraged; an attempt was made to establish a foothold in Egypt; friendly relations were set up with the grain growing countries of the Euxine; a large navy was provided to keep the straits open; the importation and ex-

portation of foodstuffs were closely regulated; agencies were created to supervise in every detail the warehouses of the emporium, to regulate grading and weights and to check the hiding of stocks, engrossing and price inflation. In the Hellenistic period the state was compelled to proceed from encouragement and regulation to direct participation in the grain trade. In the third century it was not uncommon for state officials to engage actively in the purchase and distribution of foodstuffs; at Samos, for example, the state assured a steady flow of food at low prices out of a fund especially set up for that purpose; at Tauromenion in Sicily there existed a complex bureaucracy made up of buyers, receivers and wardens handling sales of grain.

The record of Rome was not dissimilar. In her early history, thanks to the existence of a fertile soil and the development of peasant proprietorship, Rome had enough grain for her own needs and for the exportation of surpluses into Greece. But just as a metropolitan economy was in process of developing, the soil of Latium began to decline in fertility and by the third century Rome was embarking on the same imperialistic career that had made the Athenians at home in the whole Mediterranean basin. The wars with Carthage were fought over Sicily, which had become one of the great granaries of Rome; the Roman sphere later was extended into Egypt, Spain and the Pontus, largely for the same reason. During the reign of Augustus Egypt had become so important to the empire that the land of the Nile was declared forbidden ground and as such was to be kept closed to all Roman knights and senators unless permission had been expressly granted by the emperor. Tacitus indicated that the reason for such a policy was no hidden one: "It was seen that whoever made himself master of Alexandria . . . might with a small force make head against the power of Rome and, by blocking up the plentiful corn country, reduce all Italy to a famine." Just as Athens had seen the necessity of keeping the sea lanes open, so Rome realized that the land routes were the key to her power and through a ramified system of public roads was able to maintain that steady flow of foodstuffs required by her great urban populations. As N. S. B. Gras notes: "In more remote parts (of the Empire) lands would be devoted to the production of such commodities as could be transported long distances, livestock, fowl, wine, and olive oil. . . . The trade in these commodities was not only of the local town type, but interurban

and even international" (*A History of Agriculture in Europe and America*, p. 70). Nevertheless, the empire declined and even the desperate effort of Diocletian in the fourth century of the Christian era to save the towns by fixing prices for all foodstuffs was unavailing. Whether the continued sapping of the soil destroyed the towns by steadily limiting the food supply, whether the slowing up of trade due to the flight of hard money eastward destroyed the markets for agricultural surpluses, whether growing internal disorder led to a contraction of the economic round—whatever the chief cause for the disintegration of the empire, a declining food supply played its part. In the Eastern Empire a similar process of gradually increasing difficulties in maintaining the food supply led by the fifth and sixth centuries to the conscription of men for membership in the guilds responsible for the food of Constantinople.

For fully eight hundred years the Europe of the Middle Ages sustained itself because of controls exercised on population growth and by means of a self-sufficing economy. With the spread of Christianity abortion and infanticide had been abandoned, but for them were substituted celibacy and late marriage. Hunger, disease and war exacted their victims more frequently than ever before, so that Europe's population grew only slightly, if at all. The manorial system furnished security, but it checked enterprise and prevented the raising of agricultural surpluses. The three-field system, which was to be found everywhere in Europe and had not been extinguished in some areas as late as the middle of the nineteenth century, definitely hobbled agriculture: it committed all tillers of the soil in a village to the growing of the same winter or spring grains; since animals were few, it had no adequate means of sustaining the soil's fertility. Throughout the Middle Ages a commerce of a sort continued to exist of course, for the manorial system could not entirely satisfy all its wants; salt, iron and a few rude medicines, for example, still had to be obtained from abroad. In the occasional towns therefore there were to be found regular markets where exchanges and purchases might take place; there were also periodic fairs where wares from distant lands were displayed and bills of exchanges traded in; but except for spices and a few other luxury products the food supply was almost entirely local.

The end of the manorial system meant the end of this self-sufficiency; and the reappearance of

a metropolitan economy called again for social regulation of food supply in order to assure adequacy and to protect the consumer against extortion. At the same time an increase in supplies became possible as a result of new agricultural knowledge. The breaking down of the enclosures, in England particularly, was accompanied by a veritable agricultural revolution. The growing of field grasses and root crops and the fattening of barnyard stock, followed by the introduction of crop rotation, gave to the expanding world of the sixteenth, seventeenth and eighteenth centuries the assurance of more food. But this was deemed not to be enough. Consequently, with the reappearance of the towns and trade there arose in varying degree an active interest on the part of governments in the food supply.

Very early in England corn laws were passed to check the exportation of grain except in years of great plenty, a system of licenses was employed and the grain producers were required to sell their products in the nearest market towns. Under the Tudors licensing was abolished and for the protection of the native growers importation was regulated. The consumer, however, was not neglected, for laws against engrossing and speculation found a place on the statute books. London was not content to rely entirely on the action of the national government, and for a hundred years in the sixteenth and seventeenth centuries its magistrates had the grain trade of the city under their control. The importation of grain was encouraged by the fixing of a minimum price, non-citizens engaged in the foreign grain trade were given special considerations and a municipal granary was operated. The English corn laws, heavily taxing foreign grains when the domestic price was low, were in effect abolished in 1846; and from 1849 onward England was admitting grain duty free, thus confessing the inability of native agriculture to furnish the food supply required by the country's growing urban population.

In France under the *ancien régime* the story was much the same: every effort was made by the government to maintain a steady supply. In the words of J. H. Clapham: "Since the traditional rotation of crops . . . had grain supplies primarily in view . . . government influence had generally been thrown into the scales in their favor. Any variation in cropping which seemed to threaten the local supplies of cereals had been discouraged. Government regulated not only the rotation of crops but also everything connected

with grain, from sowing to market. It was not to be hoarded or wasted; its price was carefully supervised" (*The Economic Development of France and Germany, 1815-1914*, Cambridge, Eng. 1921, p. 10). In France it was the political revolution which ended this system of control and left the peasant free to follow any vagary he pleased.

Thus it may be said that during the nineteenth century for the first time in history governmental concern over the food supply, as far as provision for its adequacy went, was relaxed. Certainly governments did not proceed to leave every operation in the complex round of food supply, from growing to distribution, to chance or individual initiative. It is to be noted, however, that the emphasis of its interest shifted from concern over adequacy to concern over national security and the protection of the growers of foodstuffs as enterprisers. From these motives, the one political, the other economic, have sprung most of the controls over the production and distribution of food supply in existence in the modern world. The agricultural tariffs inaugurated in France and Germany in the 1880's, when world prices were generally declining, were due to the fact that the acceptance of war as an instrument of national policy called for preparation against the time when food imports might be cut off as a result of the control of the seas or the investing of the frontiers by a hostile navy or army. Production bounties and export bounties were probably prompted by the same motive. On the other hand, plans looking toward restrictions on the production of agricultural staples, valorization schemes and the formation of international cartels—all with the assistance or the blessing of governments—have had as their end not the furnishing of the consumer with an adequate supply but the guaranty to the grower of a fair, if not a monopoly, price.

It is to be observed that in one field of

activity, namely, supervision of the quality of food, governmental interest has been extended in modern times. By pure food and drug laws; by providing for the inspection of livestock and of dressed meats; by supervising weights and grading; by penalizing misbranding; by furnishing local inspection services of bakeries, restaurants and the like, governmental agencies have endeavored to protect the consumer from misrepresentation, extortion and unclean or diseased foods. Since the middle of the nineteenth century in every occidental country an increasingly widespread series of such agencies has been set up.

In war time even modern governments have proceeded to assume extraordinary powers over the food supply. In Germany during the World War the food supply became in every particular a government monopoly; every step in the process of production and distribution was under government control. In England by 1918 (except for the rationing of bread) the same condition had been effected. In the United States by the Food Control Law of August, 1917, the president was given dictatorial powers over the entire food supply after it had left the farms. This right was never fully exercised; the federal government resorted only to voluntary agreements with trade groups, a licensing system of all food dealers (except the retailers), and the fixing of basic prices (i.e. prices of foods when entering trade instead of when leaving) for wheat, sugar, meat and rice.

Modern war plays havoc with the food supply of those peoples which are dependent to an extent upon international trade. Up to the World War maritime law had held that food was conditional contraband and liable to seizure only if it was clearly demonstrable that it was destined for the naval or military forces of the enemy; in February, 1915, however, Great Britain made food unconditional contraband of war, justifying her position on the ground that the German rationing scheme had wiped out the distinction be-

WEEKLY CONSUMPTION PER HEAD OF CERTAIN FOODS IN THE UNITED KINGDOM,
GERMANY, AND THE NETHERLANDS, 1909-13 AND 1918

tween the civil and military populations. Beveridge's figures (see table on p. 336) indicate that the Central Powers and many of the neutral nations of Europe, whose local food supplies were inadequate, were feeling real hunger in the fourth year of the World War.

But except in the case of war preoccupation with the food supply is in modern times almost entirely a matter of business and individual activity. Society proceeds on the assumption that the competitive system will furnish the foodstuffs needed, albeit wastefully. It is occasionally shocking to note that in a world whose granaries are filled to bursting with surplus grain large populations still die of starvation, and that active measures are taken from time to time to restrict production when so many peoples are compelled to live on inadequate and poorly balanced diets. Except in the case of Russia food supply generally appears to be unplanned: the consumer tries to purchase what he thinks he needs to sustain life and health, and the producer and distributor grow and market only what they think they can sell at a profit. And the profit motive brings in its train certain evils—waste of food to maintain a high level of prices, attempts at monopoly control, price wars to derange the market, the debasing and misrepresentation of foodstuffs.

Yet under the competitive system the world is fed; occasionally, as in the case of the United States, a whole population is fed well. The process from farm to consumer, the whole of which has been built up by private enterprise, is as intricate as any in modern life. Foodstuffs have to be assembled, stored, carried, graded, financed and sold. Despite the complexity of our modern life, developments in rapid transportation and refrigeration have facilitated a steady flow of foodstuffs toward consumption centers.

One is led to ask how long a modern city could continue to feed itself in the event of complete isolation. Obviously for only a brief interval, if at all, once the stocks on grocers' shelves were exhausted. On April 16, 1923, for example, the New York port possessed in its many warehouses only enough butter and cheese for one day's trade consumption, enough eggs for seventeen days, enough poultry for forty-five days. On October 22, 1927, the 339 carloads of potatoes accumulated on the tracks in the New York City area represented only a seven days' supply. The modern city is increasingly compelled to tap a growing area before adequacy in food supply can be assured. Thus New York City gets its

milk from the whole of New York state and the border counties of western Vermont, northern Pennsylvania and New Jersey; its fresh fruits and vegetables principally from New York state, California and Florida; its dairy products largely from the Great Lakes region; and its dressed meats from Chicago, East St. Louis, Indianapolis, Omaha, St. Paul and Kansas City. The average haul is from 250 miles in the case of milk to 1500 miles for fruits and vegetables.

The question of the future of the world's food supply cannot be answered with certainty, but various trends are becoming increasingly evident. In the first place the rate of population growth is decidedly irregular. In the *Balance of Births and Deaths* (vol. 1—, New York 1928) Robert R. Kuczynski demonstrates that the countries of northern and western Europe are rapidly approaching a stationary population. Another check on world expansion lies in the fact that comparatively sparsely settled areas like the United States, Canada, Australia and South Africa have raised the bars against continued immigration. Vital statisticians agree that a stationary population will soon be reached in the United States, certainly before the twentieth century closes. At the same time students are hopeful concerning agriculture's continued advance. O. E. Baker enumerates the following six resources as being available for the increase of agricultural production: expansion of acreage, changes in the yield per acre of both crops and field grasses (aided by the use of fertilizers, the rotation of crops and the reduction of losses due to insect pests and plant diseases), shifts in the source of power (i.e. from horses and mules to automobiles and tractors), increase in the production of milk and meat per unit of feed consumed by livestock, shifts from less productive to more productive classes of livestock (e.g. from beef cattle to dairy cattle and swine) and finally shifts from less to more productive crops per acre. In brief the danger of fulfilment of the Malthusian prediction seems increasingly remote, and for the modern world the problem of the food supply becomes more and more completely one of effective distribution.

FORBONNAIS, FRANÇOIS VÉRON DUVERGER DE (1722-1800), French economist. Forbonnais came of a merchant family and was himself an industrialist. In 1756 he was appointed general inspector of currency. Forbonnais was a leading representative of neomercantilism in the eighteenth century. Of the two fundamental ideas of mercantilism, bullionism and striving for independent nationhood, he particularly emphasized the latter, deeming money to be only a secondary means to national power. He advocated the theory of a favorable balance of trade, which in his opinion insures the welfare of the people only when it increases not merely the supply of money but also the opportunities for employment. Forbonnais held to the quantity theory of money; the increase of money is harmless if it keeps exact pace with the increase in consumption. A rising cost of living he sought

to remedy from the "commodity side" of the equation, primarily by a decrease in the population and consequent decline in consumption. High prices of commodities and a high rate of interest diminish the foreign trade of a state and are consequently undesirable. A rise in the interest rate he considered advantageous only to the foreign creditor. Forbonnais discussed the problem of foreign exchange rates and believed that disturbances of state credit and abundance or scarcity of foreign bills of exchange are the main factors causing a deviation from parity. Forbonnais' theories of money and credit were influenced by Law, yet he accepted the mercantilist emphasis on precious metals. By consistent advocacy of mercantilist ideas Forbonnais in common with Melon and Dutot, his like minded contemporaries, retarded considerably the spread of the physiocratic movement.

FORCE, POLITICAL. The concept of political force requires differentiation from other forms of compulsion, either physical or moral, in two respects: it must be limited to force which is dependent upon will and is employed in imposing an order of relationships in human society; and it must be limited to uses of force which are aimed at securing power or at deciding contested issues within a structure which claims the character of a regime of law. Under this conception force need not be limited to physical coercion. Any form of willed compulsion, whether it uses economic means or even moral pressure, may become political force if it is used to accomplish political ends. But this rules out the ordinary relations of force between states, whether

relations of war or of economic measures of policy short of war, since they do not aim at the establishment of a definite legal order. On the other hand, such relations of force when undertaken by a concert of powers against a state or a group of states to enforce or to secure an international regime of law might properly be included within the definition. The existence of a League of Nations and a network of security treaties will possibly make such a use of political force characteristic of the immediate future. Relations between states which involve direct imperialistic domination fall within the definition, since they aim at creating a legal system.

Some sociological thought has been unwilling to limit the concept of the political to the legal regime of the state. According to this view the character of political action inheres in any relationship dependent upon will in which subordination is implied, and is to be found in the activity of men in any association, such as the trade union or the church. If so broad a definition be accepted, it would not be necessary to relate political action only to a system of government which attempts to legitimize and to limit force, or to monopolize its more overt and physical application as sanctions of law. It may be admitted that the character of political action in the state is in form and even in psychological content very similar to the struggle for control within other groups. But the difference lies in the scope and finality of government action. Even where purely customary law lays down the standards of behavior of communities, it claims a character of universality and inclusiveness that becomes constantly more explicit as the state's institutional development progresses. Political behavior achieves an increasingly definite focus on government under legal forms which control the monopoly of physical compulsion claimed by the state. It is with this focus, given to it originally by Plato and Aristotle, that political thought has attempted to explain, to justify or to criticize the claim of the state to a monopoly of force under a system of law.

Force itself may be limited to acts of compulsion employed to overcome resistance. Constitutional measures and constitutional methods of attempting to secure changes of government do not normally rely upon force, but upon the acceptance of symbolic substitutes, such as voting, which command general consent. Force, although it is a latent sanction of all law, is employed only where legal settlement is resisted or where constitutional measures of change are

deemed inadequate. Force may include forms of compulsion other than the purely physical. It may include pressures of all extralegal types—a fact which is today as well recognized by the suppressive methods of dictatorships toward critical speech or hostile propaganda as it ever was in antiquity.

Political theory in the Chinese and Hindu civilizations, together with what there was of political thought in the Near East and Egypt, accentuated in the early periods the theocratic nature of the state as the basis of the legitimate use of compulsion. The development of political ideas in the surviving civilizations of China and India, as in the Hellenic and Roman periods of western civilization, shows all the characteristic later shift of emphasis to "the things which are Caesar's." In the narrowly political context the simplest form of the theory of the state as founded on force alone is given by Thrasymachus in Plato's *Republic* (bk. ii), when that downright apologist of the right of might maintains that justice is only what the strongest chooses to call by that name. Socrates has small difficulty in showing not only that this is not justice but that the conception of political superiority as dependent on the fear of force is not adequate even as a description of the facts of habitual obedience. The ethical plane of Greek thought, aside from some of the sophists, never permitted an identification of justice with *Faustrecht*. But Thrasymachus represents accurately enough the large outlines of the oriental habit of mind, against which Greek thought reacted.

A more sophisticated use of force as an explanation of the source of political authority occurs in Polybius: in the origins of political society or in the recurrent recoveries from barbarism and natural catastrophes men submit like other animals to the natural rule of the strongest; but this despotism soon learns to cloak itself with legality in order to meet the growth of reason. There is in Polybius, however, an attitude toward the importance of finding the right type of balanced government that is quite unlike the indifference of the Epicureans to legitimacy, which so curiously anticipates Hobbes in all his fundamental points, including the social contract as an escape from the original and arbitrary force of the state of nature. The stoics, for their part, pushed the ethical concepts of the universality of justice and law to a point that forgot the essential truths of the determinate physical and psychological forces which Polybius had noted as conditioning political behavior.

The concept of Roman law which centered about the *potestas* in its relation to the *imperium* and the *majestas* implied a truer understanding of the character of political force in an established legal order: force or the power to command it as a sanction was an essential attribute of a government claiming the support of law. It must be able to impose commands even where willing obedience was absent. A great part of the speculative mediaeval theory, which revolved about the relations between a universal church and a state which attained even as little universality as the Holy Roman Empire, dealt with the refinement of this Roman law conception and with its limitation in terms of a higher moral order than that of the state considered as the embodiment of force. Even as an order of pure fact (and not as a moral ideal for human society or for St. Augustine's *De civitate Dei*) the limits of arbitrary force in practise show government to be a resolution of forces rather than a simple dominance, in any order of society. In terms of political and moral ideals, Dante's division of the two orders of church and state into their respective moral spheres represents perhaps the summit of mediaeval thought.

It has been called the characteristic contribution of Machiavelli that he restored political thought from its theocentric mediaevalism to a realistic and "scientific" basis in terms of force. More recent research has shown, however, that in his emphasis upon political power as derivative from military force and cunning statecraft he was not the revolutionary and original figure among his contemporaries that he has sometimes been held to be. But prior to Hobbes he is the outstanding exponent of the force theory of the state, even allowing for the larger view of the *Discorsi* when compared with *Il principe*, the work on which his fame largely rests. Hobbes also reduced the political order, by his version of the social contract, to a consent basis that none the less rests on superior force as its sole claim to legitimacy. The intimate relationship of his logic to the need for a secure national order has been sufficiently commented upon. It has often been remarked as well that his premises must be criticized in the light of the universality of the type of human nature and human society which both he and Machiavelli saw about them.

The moral claim for the need of the legitimacy of force was not to be stifled by the mere reiteration of these views of human nature in a contract theory. The persistent need for moral sanction ran through the works of both the defenders

of divine right and the monarchomachs. As nationalism drew on to its democratic phase, Locke and Rousseau restated the case for consent. The latter summed up finally a judgment of historical fact as well as of ethical value in the statement: "The strongest is never strong enough to remain forever master unless he transforms force into law and obedience into duty." Rousseau's own transformation of the force of law into consent by the apparatus of the "general will" still underlies most of the democratic philosophies of the state.

Nineteenth century liberalism produced the emphasis on moral consent which took its most finished form in the writings of J. S. Mill and T. H. Green. But it produced from its utilitarian origins also the analytical theory of legal sovereignty of Bentham and John Austin. Purely formal in character, this lawyer's theory rested its weight upon the command of a determinate superior. But it was not dependent simply upon force in spite of its emphasis on sanctions. It specifically rested upon "the habitual obedience of the bulk of the community" without troubling further to analyze the sources of that obedience. This duty the historical school of jurists undertook, putting force in its due relationship to the other factors in political obedience—custom, consent to divine right or to representative legislation, and social beliefs. Under the influence of the Hegelian theory English idealism reverted to a revised version of the "general will" to explain and justify the sovereignty of the state and its monopoly of force. Juristic thought elaborated the *Rechtsstaat* both as an explanation and as a defense of the state's limitations in the use of this force.

The idea that von Treitschke ever talked of the *Machtstaat* as if it were a pure antithesis to the *Rechtsstaat* originated in wartime distortion. German theory, particularly that of military historians like von Delbrück and Bernhardi, did, however, talk of law and the state primarily in terms of force. Karl Marx and the socialist and communist theorists who followed him, with the possible exception of the revisionists, tended also to simplify in the direction of making political force the mere handmaid of economic force. They drew heavily upon the conquest theory of the origin of the state, deriving from Gumpowicz and finding its final expression in Oppenheimer, who held that the state came into existence and continued merely as an instrument of class exploitation.

In the contemporary critique of all these the-

ories by political pluralism the emphasis of one school falls on the moral individualism of ethical theory. This individualism has been transferred by Figgis and by Laski (at least in his earlier works) to the group, under the influence of Maitland's doctrine of corporate moral personality. By another school of pluralism, represented by the positivistic realism of Duguit, stress is laid upon fear and force as the facts of government, but the assurance of the total complex of public services is proclaimed as a norm of legitimacy. Political pluralism does not necessarily deny force to the state; but it usually appeals to the existence of conflicting forces to deny to the state an exclusive or an effective monopoly over the use of force.

Both Fascism and Bolshevism unhesitatingly repudiate the democratic dogma which justifies the state's monopoly of force on the grounds of constitutional consent, secured by the expression of a popular will through some form of the majority principle. Each alike rests finally upon a monopoly of force, which requires a suppression of all free association and criticism. Each accomplishes openly a falsification of the representative principle by means of oligarchical dictatorship through control of the sole party having legal status. But it is significant that each has had a stubborn struggle with the church and that each justifies its unstinted use of force by what Plato would have called "a royal lie." The social myth of Bolshevism holds up as its ideal the realization of a communist and international utopia through the transitional dictatorship for rather than of the proletariat, in accordance with Marx and Lenin. Mussolini's Fascist apologists rely upon the older myth of Machiavelli—a revived Italian nationalism reminiscent of Roman imperial grandeur—for the indoctrination of the coming generations. Each has a pattern of ideal justice which forces conformity with its dogma; and in the realization of this pattern each employs a machinery which is imitative of Plato. Georges Sorel's apology for revolutionary syndicalist violence against the bourgeois and democratic state perhaps introduced a refinement in terminology which need hardly be considered a necessary one: violence, he thought, could be considered as that aspect of political activity which attempted the overthrow of the existing order by any means, including sabotage, general strike or *vi et armis*; political force, on the contrary, might be limited to the repressive activity on the part of those commanding for the time being the machinery of the state.

If the present era of wars, revolutions and dictatorships has seemed to argue a trend toward a greater emphasis on force as the final source of authority, it must be remembered that, as Sorel has suggested, each important movement usually rests upon a social myth commanding wide acceptance. There is another order of phenomena also to be considered—the "soul force," or ahimsa, of Gandhi in his political, although non-violent, non-cooperative revolution against the British raj in India. Despite elements of traditional force in such a program there is a purely moral force also which is compulsive in its effects. The evolution of the self-governing dominions of Great Britain to statehood through consent and the attempt to preserve a British Commonwealth of Nations by methods of consultation and conference essentially like those of the League of Nations may in yet another way show a realm in which moral consensus, not force, is gaining ground as the basis of the legal order.

FORCED LABOR. To maintain life a minimum of labor is necessary, and whether or not this is considered "forced" or "compulsory" depends very much on one's philosophy. Even though an individual is obliged to labor in order to live, he has a considerable choice in determining the nature and the extent of his efforts. But under forced labor as the term is customarily employed this element of choice is usually absent.

Over and above the labor imposed by the burden of human existence almost every government has obliged its citizens at one time or another to perform certain services. Subjects of the Roman state were compelled to labor on public works. Herodotus tells of the use of forced labor by Persian rulers for transport and dispatch services (*angarevo*) and by Pharaoh for the construction of the Great Pyramid. Forced labor was from early times the chief means of maintaining the Egyptian irrigation canals. Most of the population of mediaeval Europe was subject to legally defined forced labor, for example, road work (*corvée*), transport service (*angaria*) and other feudal servile obligations.

One of the earliest systems of forced labor for private purposes was established in America in 1499. Under this *repartimiento* or *encomienda* system the Indians, theoretically vassals of Spain, were divided up among the Spanish settlers and compelled to work for them in order to encourage colonization. The Egyptian government provided forced labor for the construction of the Suez Canal, until an outburst of humanitarian agitation, stimulated by British opposition to French interests in the Suez, led the sultan to stop the practise in 1863. Forced labor has sometimes been employed as a transitional measure between slavery and free labor. Thus the emancipated Roman slave was obliged to perform some services for his master, and the Jamaica Emancipation Act of 1833 freed the Negro slaves but allowed the white planters to hold former slaves for seven years as compulsory apprentices.

Today the majority of governments utilize forced labor in the form of military conscription, and many public authorities, including some in the United States, still require able bodied men to work a certain number of days a year upon the roads, an obligation usually commutable by a money payment. Many governments compel convicts to labor either in prison shops, on public works or for private enterprises which pay the state for the labor.

Within recent years certain governments have imposed more sweeping obligations. A Bulgarian law of June, 1920, amended in 1921 after protests from Entente powers that it violated the military provisions of the Treaty of Neuilly, requires young men to work for eight months and young women for four, only 30 percent of any age class being liable at any given time. In 1930 more than 16,000 young men were enrolled in the Bulgarian labor army. The constitution of the Union of Soviet Socialist Republics (ar-

ticle ix) "recognizes labor as the duty of all citizens of the Republic," and section 11 of the Soviet Labor Code of 1922 provides that "in exceptional cases [fighting the elements or lack of workers to carry out important state work] all citizens of the R. S. F. S. R. with certain exceptions [children, aged, disabled, ill or women during the eight weeks preceding and following the birth of a child] may be called up for work in the form of compulsory labor service." Compulsory labor may also be imposed as a penalty for the commission of certain offenses. This type of forced labor, given theoretical expression in the principle of "no work, no bread," has been justified on the grounds that it is a normal civic obligation which benefits the community as a whole and that as such it meets the approval of public opinion. The unique elements involved here are that the compulsion is explicitly stated, given full legal sanction and made universal.

More extreme forms of "forced" or "compulsory" labor are found in backward and colonial regions. In most tropical areas the white man is unable or unwilling to perform manual labor, and in order to carry on its activities outside enterprise must rely either upon the local population or upon imported coolie labor. Since the material wants of primitive peoples are few and they are unfamiliar with a money economy and unaccustomed to arduous and continuous toil, they are usually unwilling to work for European entrepreneurs. Out of the conflict between native indifference and the desires of outside governments and industrialists forced labor has arisen in many areas. Many of the chief tropical railways and roads have been constructed by forced labor. Indeed, it is doubtful whether the tropics could have been held and developed to their present extent by outside forces had not this practise been employed.

In most tropical colonies today, including all of central Africa, forced labor, paid or unpaid, is still imposed for the maintenance or construction of public works, for portage (still one of the chief means of transport in the tropics) and the like. In the French colonies natives may be required to work without pay (*prestation*) for annual periods ranging from three days in Algeria to sixteen days in Indo-China. Many British colonies authorize unpaid communal labor for four weeks a year. The *corvée* is still found to some extent in British India, and in many native states the *veth* and *begar* systems of forced labor prevail. Under a labor tax, the *Heerden-dienst*, imposed by the central government and

native states of the Dutch East Indies for the construction and maintenance of public works, all able bodied men with certain exceptions may be called upon to provide unpaid labor up to a maximum of forty days a year. In 1927 the government exacted 31,427,001 workdays of forced labor. In the Belgian Congo unpaid labor is exacted for communal purposes. In British East Africa the government may conscript natives for not more than sixty days a year. In Kenya and Uganda the prior consent of the secretary of state for colonies is necessary except for government portorage. Under the system of military conscription followed in Madagascar and French West Africa natives were divided before 1926 into two contingents, one obliged to perform three years' military service, the other exempt. French decrees of 1926 made those in the second contingent liable to draft service in a manual labor army. In Liberia both unpaid government portorage and local road work are performed by forced labor. From Liberia Kroo boys have been shipped to Fernando Po to do forced labor for the Spanish planters, who pay high Liberian officials for their services.

Compulsory labor has also been imposed in backward areas for the benefit of private employers such as mine operators or plantation owners. Until 1926 the authorities of the Portuguese colonies might legally hand over to private employers any natives who declined to work, and certain *prazo* holders in Portuguese West Africa may still collect labor taxes from natives. In parts of Dutch Java, where under the culture system from 1830 to 1871 forced labor was the rule, landowners retain a traditional right to exact fifty-two days of labor annually. With these exceptions there does not seem to be any government today which legally exacts forced labor for private purposes.

In some colonies, however, for example parts of British South and East Africa, the native having been deprived of land adequate enough for independent economic existence is literally compelled to labor for European mine or plantation owners. Natives may also be indirectly induced to accept European employment by being subjected to heavy cash taxes which they cannot pay except out of wages. Under the concession system followed at one time in the French Congo and the Congo Free State natives were often obliged to pay heavy taxes in the form of raw produce at prices fixed by European officials. These prices were often below those in the open market.

Today forced labor also indirectly arises out of the so-called vagrancy and pass laws, under which it is possible for local officials to force unemployed persons or those without credentials to work at tasks and for wages set by state agencies. A form of labor complex in origin but plainly involving non-voluntary elements was early English factory labor; the laborers were recruited from a class of peasants made landless by the enclosure movements and compelled to seek a livelihood in the new factories. Likewise many colonial governments, while becoming sensitive to charges of forced labor, still insist upon the "moral obligation" of a native to work.

From the administrative standpoint it is difficult to secure the abolition of forced labor by treaty because instead of resting on the sanction of legislation forced labor is usually imposed by administrative regulation, and the men are usually obtained from native chiefs rather than directly drafted. Although there may be no law requiring the chief to fill the quota or compelling men to labor, the chief, realizing that his position depends upon the administrator's good will, usually fulfils the request. In fact, the practise of *isibalo*, or forced labor for the government, begun in South Africa around 1850 was based on the Bantu system which recognized the individual's obligation to labor for the chief.

Forced labor for public purposes has frequently been defended on the ground that the results will benefit the native population or that the only alternative to forced labor for public works, increased taxation, would force the natives into uncontrolled European employment that would do more social damage than the direct imposition of forced labor. Many business men and some colonial officials also defend forced labor for private enterprises on the ground that primitive peoples will not progress until they learn how to work and that the wealth of the tropics cannot be exploited for the benefit of the outside world unless forced labor is employed. Nevertheless, the fact undoubtedly is that although forced labor is frequently declared to "do good" to native peoples, its chief service is to the interests of outside governments and industrialists. Experience has demonstrated that in many cases the social results of forced labor, which is applied in the tropics much more ruthlessly than in a European country because of the absence of restraints from public opinion, are disastrous. Moreover, from the economic standpoint compulsory labor as a rule is less efficient than voluntary labor, especially as some

employers of conscripts are likely to be wasteful of labor. Furthermore, the association of labor with oppression, like slavery, tends to discourage the development of habits of industry and initiative.

Frequently natives have been forced to travel long distances to a strange scene of employment, where they have been subjected to a new climate and exotic food. Although many governments now take every precaution concerning housing, food and medical care, the mortality rate of conscript labor is still excessive. When the native is suddenly and forcibly thrown into contact with industrial civilization his psychological resistance to diseases such as tuberculosis is lowered. Because of the compulsory methods used in the construction of the Congo-Ocean Railway in French Equatorial Africa and the failure of the administration to take adequate precautions 17,000 native laborers engaged on the enterprise died between 1925 and 1929. When concentrated in labor camps natives tend to lose their moral standards and their respect for their native chiefs and native customs generally. Moreover, the absence of men at European labor centers has created havoc with family and tribal organization. In order to avert a condition of social anarchy, which was threatened as a result of excessive recruiting of labor, the government of the Belgian Congo in 1925 issued instructions to the effect that no more than 10 percent of the male population could be taken from a native community to a labor center, although an additional 15 percent could be employed on plantations in the vicinity of their homes.

For economic and humanitarian reasons international protests against forced labor have been frequently made. Before the World War atrocities were exposed in the Congo Free State, the French Congo, the "cocoa islands" of Portugal and the Putumayo district lying between Colombia and Peru. Public knowledge of the horrible character of these atrocities and of the general social consequences of forced labor led the old antislavery societies to devote themselves to agitation against forced labor and to a humanitarian demand for its abolition or limitation. The report on Liberian conditions made in 1930 by an international commission of inquiry also stimulated this sentiment.

The first international restrictions were imposed on forced labor in the African and Pacific mandates of the League of Nations, by which labor may be imposed only for essential public services. The mandates do not prohibit com-

pulsory labor of women and children or state that compulsory labor may be imposed only after recourse to voluntary labor has failed, nor do they fix the term for which forced labor may be imposed. In 1924 the League established a Temporary Slavery Commission, and largely as a result of its studies a Slavery Convention was opened for signature at the Seventh Assembly in September, 1926. This convention recognizes (article v) "that recourse to compulsory or forced labor may have grave consequences" and makes obligatory "all necessary measures to prevent compulsory or forced labor from developing into conditions analogous to slavery." But while it requires "adequate remuneration" and forbids the removal of laborers from their usual place of residence, it permits compulsory or forced labor for both public and private purposes, providing that "the High Contracting Parties shall endeavor progressively and as soon as possible to put an end to the practice" of forced labor for private purposes. This convention was signed by thirty-six governments and adhered to with a reservation by the United States.

Believing that the Slavery Convention was not sufficiently comprehensive, the governing body of the International Labour Office in 1926 established a Native Labour Section and appointed a Committee of Experts on Native Labour. Upon the basis of this committee's exhaustive report on the law and practise relating to forced labor the convention of June 28, 1930, was drafted by the fourteenth session of the International Labour Conference, providing for the suppression "within the shortest possible period" of all forms of work or service "exacted from any person under the menace of any penalty and for which the said person has not offered himself voluntarily." It exempts from its definition of forced labor any work exacted in case of emergency, in virtue of military conscription or as a consequence of a conviction in a court of law or which forms part "of the normal civic obligations of the citizens of a fully self-governing country" and minor communal services, provided that the members of the community have the right to be consulted as to the need for such services. The convention provides that compulsory labor for private purposes must be completely suppressed and that compulsion for public purposes may be employed during a transitional period only. Before forced labor may be exacted for public purposes the competent authority must satisfy itself that the work to be done is of present or imminent necessity and of

important direct interest to the community, that it has been impossible to obtain voluntary labor and that the work will not lay too heavy a burden upon the present population. Forced labor exacted as a tax shall be progressively abofished. Only adult able bodied males between eighteen and forty-five may be called upon for forced labor. Whenever possible a medical officer shall determine physical fitness. School teachers, pupils and school officials shall be exempt. At no time shall the proportion of able bodied males taken exceed 25 percent. The maximum period for which any person may be taken shall not exceed sixty days a year. Normal working hours and wages shall be the same as for voluntary labor and a weekly day of rest shall be provided. Except in cases of special necessity persons from whom forced or compulsory labor is exacted shall not be transferred to districts where exotic food and climate will endanger their health. In no case shall workers be transported unless all measures relating to hygiene and accommodation necessary to adapt them to the new conditions can be strictly applied. Signatories undertake to make an annual report on the measures taken to carry out the convention. At the end of five years the governing board of the International Labour Office shall report to the General Conference on the working of the convention and the desirability of revision. By June, 1931, Great Britain, the Irish Free State and Liberia were the only governments to have ratified this convention.

The United States tariff act of 1930 (section 307) prohibited the entrance of "all goods, wares, articles, and merchandise produced or manufactured wholly or in part in any foreign country by convict labor or/and forced labor or/and indentured labor under penal sanctions" except when such goods are needed to meet the consumptive demands of the United States. Thus this measure serves to protect American industry rather than to discourage forced labor as such. This fact, considered along with the political difficulties facing a government which attempts to determine whether or not forced labor exists in foreign countries, would indicate that the imposition of sanctions against forced labor in a foreign country should be applied, if at all, by the instrumentality of international organization.

FORCED LOANS are loans in name only. They are imposed upon the citizens by state authority and consequently lack the contractual basis which is an essential feature in the ordinary credit transaction. Forced loans differ, however, from ordinary taxes in that they carry a promise of repayment of principal as well as the payment of some rate of interest. Gaston Jèze distinguishes between forced loans in countries without accumulations of wealth in liquid form and with no organized capital market ready to lend large sums to public debtors, and forced loans in countries with fully developed capitalism. In the former forced loans seem to have been the only effective way of raising large sums quickly; in the latter they may be justified only as an extraordinary fiscal measure to meet exceptional needs.

Forced loans were widely resorted to in the Middle Ages and in modern times up to the eighteenth century. There was, however, a great difference between sporadic loans extorted by monarchs from great vassals, wealthy citizens, high functionaries, rich tax farmers and Jews and forced loans regularly demanded by the self-governing and highly developed Italian cities. In the former countries forced loans reflected the primitive ideas on credit and were looked upon as an assertion and often abuse of absolutist power. The people were exasperated not only by the brutality with which the loans were often extorted but still more by the suspicion that the constitutional rights of the three estates might be endangered by such loans. Such were the forced loans in France until 1715 and those of the British kings until the middle of the seventeenth century. While the York and Tudor kings understood how to secure money by "benevolences" in an apparently semivoluntary way, the Stuarts did not always avoid brutality in raising money. Their methods were so offensive to the people that Charles I was obliged as a concession forced by the Petition of Right to agree "that no man hereafter be compelled to make or yield any gift, loan, benevolence, tax, or such like charge, without common consent by Act of Parliament." Nevertheless, in 1640, after having seized £130,000 which had been deposited in the Tower by the merchants, Charles refused to give back the money before he received a loan of £40,000.

The self-governing citizens of mediaeval Venice, Florence and Genoa regarded forced loans as a very effective and generally not disputed fiscal policy. The origin of forced loans in the Italian cities is hard to determine. It is known that forced loans were made in Venice in 1171 and 1172 and that in 1228 citizens were obliged to declare themselves by oath as ready to lend money to the republic in case of need. There were several factors which favored the widespread use of forced loans. The modern democratized system of credit, the issue of bonds payable to bearer in small amounts to be subscribed by the middle class out of savings and suitable for sale in capital markets, was as yet unknown; voluntary credit was given only for short periods and secured by a general bond in the name of the creditor. These creditors were a few capitalists of great political influence who not only demanded high rates of interest but generally insisted upon the control of specific sources of revenue as a pledge for their loans. Thus cities ran the risk of losing the control of their revenue system by resorting to voluntary credit. The direct taxes, most of them in the form of a general property tax, were nowhere exactly assessed and the yield was hardly sufficient to meet all fiscal needs of the time. The ruling classes, when called upon to contribute larger sums to meet fiscal needs in critical times, preferred to do it in the form of a forced loan, which assured them the return of the capital and a modest money rent. Interest charges on forced loans were covered by import and export duties, the salt monopoly and other taxes which in the main were paid by the lower classes. Finally, the institution of forced credit offered an escape from the operations of anti-usury laws; ecclesiastical authorities regarded the receiving of interest as less sinful when the creditor was forced to lend the money.

The city republics regarded forced loans as a special debt to be repaid as early as possible. The loans were paid on the basis of property as assessed for purposes of taxation. The assessments for the property tax were periodically renewed. Declarations were made under oath and scrutinized by experts. Nevertheless, property was assessed at a value much lower than its real value. Small fortunes were exempt, and property invested in forced loans was to be deducted in the assessments of property. According to Luzzatto interest on the forced loans—generally 5 percent—was with small interruptions regularly paid by Venice in the years between 1262

and 1381 and also for some decades after. The repayment of capital was not regular, but periodically attempted with energy. People who had no liquid sums at their disposal often saw no other way of raising the money demanded for loans than by selling their older claims at a discount. Notwithstanding the difficulties involved in the transfer of claims booked in the name of each creditor there was nearly always a lively commerce and much speculation in forced loans. As long as the interest was paid regularly and without deductions many rich people from other cities trusted the honesty of the republic and were ready to acquire Venetian loans. In the long run, however, the financial situation of Venice became endangered by the burden of the increasing debts. Occasionally, when the often repeated forced loans seemed no longer a sufficient source of revenue, desperate expedients such as reduction of interest on the debt and of the salaries of functionaries, loans from the revolving fund of the autonomous grain administration and sales of public real property were attempted.

In modern times the mediaeval practise of forced loans was replaced by the system of voluntary credit which, developed in the middle of the seventeenth century in the Netherlands, was widely adopted in England at the end of the eighteenth century and in most other civilized countries in the nineteenth. Only France after the revolution reverted for a brief period to the forced loan policy, but with less success than the mediaeval Italian republics. From 1815 to 1914 all well governed countries relied almost exclusively on voluntary loans in their credit transactions. The period of the World War and the years following it witnessed a temporary reversion to the practise of forced loans, although in the somewhat disguised form of placing treasury bills with the note issuing central banks and the consequent suspension of specie payment for banknotes. Generally, however, the belligerent states preferred the use of voluntary credit, although the enormous pressure of patriotic propaganda and public opinion under which the loans were obtained impaired their voluntary nature. Forced funded loans were decided upon in Holland in 1914, in New Zealand in 1917, in the Australian commonwealth in 1918—generally with the effect that the mere decision was sufficient to bring forth a flow of voluntary subscriptions. After the war Norway announced a forced loan in 1920 but was able to find subscribers at easy terms for a voluntary loan; like-

wise Italy avoided realizing the plan of a forced loan agreed on in 1919. Germany during the most critical political and financial situation of 1922 risked the experiment of a forced loan with little success: the interest has not been paid nor the principal refunded. Likewise Poland, Czechoslovakia and Greece tried the expedient of forced loans, on the whole unsuccessfully.

Experience has proved that voluntary funded debts in the form of interest bearing bonds which are placed with investors at home and abroad are in normal times for well administered states a much more effective method than forced loans.

Gaston Jèze's argument that forced loans may be justified in highly civilized countries as an emergency measure may be correct if citizens are to be obliged not only to die but also to pay for their country. But only when all obligations of the debt service are without exception scrupulously fulfilled may forced credit be justified as the lesser evil in a complicated situation. Very often, however, forced loans are only a symptom of inefficient credit policy or of a careless budget policy of governments. They may be easy expedients at the time and may enable the most incapable government to subsist for a short time, but no state can in the long run arrive at satisfying results by continued use of such means. It is only by one method of forced credit that great sums may be quickly raised in modern times—by issuing inconvertible paper currency, a method correctly defined by Adolf Wagner as a forced loan on the metallic money circulation. But the fatal social, economic and financial consequences of such a policy of inflation are well known.

FORD, HENRY JONES (1851-1925), American journalist, historian and political scientist. His journalistic career, which identified him with newspapers in Baltimore, New York and Pittsburgh, began soon after his graduation from college and lasted until 1906, when he became a lecturer in politics at the Johns Hopkins University. In 1908 he was appointed professor of politics at Princeton University, where he was thrown into close contact with Woodrow Wilson. During Wilson's governorship Ford was appointed state commissioner of banking and insurance of New Jersey and early in Wilson's first presidential administration was sent on a mission to the Philippines. As a member of the Interstate Commerce Commission during 1920-21 he conducted several important investigations and prepared one noteworthy decision concerning the commission's authority to fix intrastate railroad rates.

In *The Natural History of the State* (Princeton 1915) Ford presents a moderate defense of the organic theory of the state without, however, upholding the metaphysical or idealistic point of view. His theory of the state shows the influence of Darwinism more than it does of Hegelianism. During the latter years of his life his work in politics centered more and more on the problems of representative government, in which field he may be considered to have continued the work of John Stuart Mill. In *Representative Government* (New York 1924) he rejects the Teutonic theory of the origin of representative institutions, contending that the real model of the British Parliament was the representative system worked out in the Dominican order. In reference to modern government his chief contention is that in order to secure effective representation the representative must be made responsible and that any devices such as direct legislation which enable the representative to avoid responsibility tend to defeat the true nature of representative government.

FORECASTING, BUSINESS. Prediction is an integral part of any scientific generalization as to the relationship between two or more factors: if properly established the generalization must hold not only with regard to observations made in the past but also in all future observations of the same phenomena. Prediction is even more organically related to those generalizations which establish a definite time sequence in the occurrence of certain factors. Indeed generalizations of this type form the essential logical basis of all types of forecasting whether they concern the weather or the stock market. On a different level the same is true of so-called evolutionary laws, or laws of development. For this case, however, an important qualification must be made: since such laws involve complicated combinations of simple relationships of co-existence and sequence, unforeseeable changes in the combination may invalidate at least in part forecasts implied in generalizations regarding trends of development. In so far as economic theorists have attempted to formulate evolutionary laws, they have also indulged in long range economic forecasts; witness, for example, the law of diminishing returns in its earlier versions, Ricardo's generalizations regarding long time trends in the distribution of income or the Marxian formula as to concentration of wealth and proletarianization of the masses. Such predictions, based upon a theoretical analysis of structural changes in the economic system, are quite different from business forecasting. The problem of the business forecaster is a more limited one: whether he is concerned with a single branch of business activity or with general business conditions he aims to anticipate only those changes which may be expected to occur within a few months. Even "intermediate forecasting" for a period from one to five years is commonly regarded as too ambitious an undertaking for a business forecaster. Because of their greater concreteness and immediacy business forecasts are more dependent upon accurate and prompt measurement of the current situation than upon a theoretical interpretation of the forces at work.

It is obvious from the nature of the business system that prediction has always been a function of enterprise, but business forecasting as a specialized activity is almost entirely a development of the twentieth century. Specialization in forecasting has grown out of the work of gathering and summarizing information about general business conditions and has received great impetus from the recent rapid accumula-

tion of economic statistics, the development of statistical technique, the study of business cycles and the urgent need of men of affairs to make prompt and appropriate adjustments to the increasingly frequent changes in business conditions.

Before the close of the sixteenth century there had developed in Venice and a few other trading centers specialized information gathering services which provided merchants and other subscribers with political and trade news. During the same century the Fuggers of Augsburg developed and maintained an extensive international information service for their own private use. The phenomenal rise of the house of Rothschild in the early years of the nineteenth century was based in no small part upon the efficiency of its private news service, which enabled the firm to receive in advance of its competitors information of vital import to its financial interests.

As the activities of the peoples of western Europe and America became increasingly organized on the basis of a business economy, the sources of information concerning business gradually became more numerous and more reliable. Since the middle of the nineteenth century in the United States and England a growing number of financial, commercial and trade periodicals have been established which provide monthly or weekly reports of business conditions and developments. Yearbooks and other publications of various government departments, consular reports and bank letters on business conditions have also increased in number and content. Reports on the condition of national banks in the United States were made four times a year or oftener beginning with 1863. Data at monthly or more frequent intervals were available on such items as foreign trade, bank clearings and interest rates. In 1884 the Dow-Jones daily letter was first issued, containing an average of daily prices of certain stocks on the New York Stock Exchange. In 1897 *Bradstreet's*, which had for some years published quarterly the price quotations for about 100 commodities, began the monthly publication of a composite index of these prices; in 1899 the London *Economist* began publishing a monthly price index. About 1900 monthly data for such important items as building permits in large cities and pig iron production for the entire country became available in the United States. Elsewhere current business reporting on a systematic basis has developed more recently, but it is growing rap-

idly in all industrialized countries and is becoming increasingly quantitative in character.

It is not surprising that the United States, with its increasing variety of currently available economic statistics, its business subject to wider fluctuations than those found in Europe and its people largely absorbed in business pursuits, should have been the first country to develop organizations specializing in the forecasting of general business conditions. In 1904 R. W. Babson established a commercial service to provide clients with both business reports and business predictions. For several years he experimented with the construction of charts of economic time series and finally with the computation of a composite barometer. The Babsonchart, which was destined to become widely known in the business world, was first published in its familiar form in 1910. By novel means its author had combined into a single weighted index of general business a large number of time series representing agricultural and industrial production, interest rates and commodity prices. For most of these series he used a unique type of adjustment for seasonal variation, and he represented the long time trend of the composite by an adjusted index of bank clearings. There also appeared upon the chart separate indices for stock prices, commodity prices and bond yields. In so far as Babson's forecasts were based upon this chart they were said to be inferred primarily from the relation of the composite index of business to the line representing normal.

Almost simultaneously with the beginning of regular publication of the Babsonchart, J. H. Brookmire, who had for several years been providing a group of clients with business forecasts, formally established another forecasting service. Brookmire was a pioneer in forecasting on the basis of cyclical sequence. His chart portrayed three indices representing respectively credit supply, stock prices and volume of business. He held that a persistent rise of an index of the potential supply of bank credit was typically followed in a few months by a similar rise in security prices and that the latter in turn was followed by an expansion of general business and a rise in commodity prices; the declines of the three factors, which completed the cycle, followed in the same order.

Crude as were the statistical methods employed by these pioneer organizations in the early years of their work they performed valuable service in forcing upon the attention of the business man the importance of analyzing funda-

mental series of economic statistics. Certain early services specializing in security market forecasts have also done work of educational value. The oldest of these, that of Thomas Gibson, was begun in 1907.

While practical men were grappling directly with the problem of prediction, the groundwork was being laid for the making of fundamental contributions by scientific workers. During the second half of the nineteenth century European investigators, unable longer to dismiss the recurring economic crises as manifestations of fortuitous maladjustments in the economic system, attempted more careful explanations of the periodicity of business fluctuations. Nearly all of them buttressed their analyses with some reference to historical data and to such statistics as were available. The first to make considerable use of statistics was Clement Juglar in his monumental work, *Des crises commerciales et de leur retour périodique* (1862). A notable advance in this type of statistical investigation was marked by the publication in 1913 of Wesley C. Mitchell's *Business Cycles*, which is a statistical study of annual economic data for the United States, England and France from 1890 to 1911 combined with a historical and theoretical analysis. At the same time considerable progress was also made in the methods of statistical analysis. New techniques which were evolved first in the field of biometry were soon applied to social and economic statistics. Outstanding examples of their application to economic time series were found in Henry L. Moore's *Economic Cycles* (1914) and *Forecasting the Yield and the Price of Cotton* (1917).

About 1915 attention was attracted to the attempts of Warren M. Persons to improve upon the statistical technique of forecasting general business conditions. Largely on the basis of his preliminary results he was appointed statistician of the Harvard University Committee on Economic Research upon its formation in 1917 and there carried forward the first work in business forecasting to win general recognition from statisticians and economists. Persons subjected to cyclical analysis every appropriate time series available for the United States; the results announced in 1919 covered the pre-war period from 1903 to 1913; later the investigation was extended to the years 1875 to 1902. Each series was corrected for seasonal variation and for secular trend and, since the result was held to represent a combination of cyclical and random fluctuations, those series which appeared to be

largely affected by factors independent of the cyclical movement of business activity were not used. Then in order to measure as precisely as possible the average relationship with reference to time between the movements of the various series the coefficient of correlation for each pair of series was computed for different amounts of lag. The computations showed that the series fall naturally into three groups representing (a) stock speculation, (b) the condition of industry and trade and (c) the supply of funds. While the series in each group tend to fluctuate synchronously, the sequence in the movements of the different groups is speculation-business-money. The series in each group were then merged into a kind of average and the forecasting system based on a study of the movements of the three composite curves. The original results obtained by the Harvard group confirmed the earlier three-curve barometer of Brookmire, but the methods by which the Harvard barometer had been derived and the care with which the interrelations among the movements of the curves were interpreted represented important advances over Brookmire's pioneer work.

Several years later the Harvard system of forecasting was considerably modified. It was held that beginning with 1923 the United States entered an era of the "regulated business cycle," the principal manifestation of which is a fairly even course of the general level of business activity accompanied by brief fluctuations of an "intermediate character" in security and commodity speculation and in the production of basic materials. To predict these intermediate movements and the associated shifts in credit the study of a number of series not included in the three composite curves was found necessary.

Harvard was probably the most important single factor in American forecasting in the post-war period. It has exercised a considerable and almost immediate influence upon the statistical methods of the other forecasting services and stimulated the establishment by a number of university bureaus of business research of forecasting services for local regions. It has also influenced the forecasting work of the rapidly growing number of large private business concerns that employ economic statisticians to assist them in shaping their business policy in conformity with the business outlook.

Another major influence in this field has been the work of Henry L. Moore. It has been important in the forecasting of price and production of individual commodities, particularly agricultural

products, to which increasing attention has been given both by government departments and private bodies. In this branch of forecasting a highly refined statistical technique has been employed: lines of regression obtained by multiple correlation are used as bases for prediction.

The development of forecasting in the United States has proved internationally contagious. Since 1921 at least one institute for business cycle research and forecasting has been established in practically every country in Europe, most of them affiliated in some way with universities and some of them having official connections with statistical departments of governments and trade associations. The London and Cambridge Economic Service, established in 1923; the section on economic indices of the statistical institute of the University of Paris, which began functioning in 1923; and the committee on economic indices of the universities of Padua and Rome, created in 1926, cooperate with the Harvard group and among themselves in the interpretation of business conditions, special emphasis being placed upon developments in their respective countries. Nearly all of the European forecasting services and the Canadian Economic Service affiliated with McMaster University have adopted much of the technique of analysis employed by the Harvard service. They have stressed the importance of the accumulation and interpretation of data rather than the development of statistical technique. Many of them do not regard forecasting as a major line of activity and have not gone beyond predicting fluctuations of a seasonal character. The conditions in these countries are in certain respects quite different from those obtaining in the United States: in some of them the importance of agriculture as a factor in the national economy is much greater, virtually all of them are more affected by the "irregular" disturbances characteristic of the period of post-war readjustment, and in a number of countries reliable and promptly available data are scarce.

An exceptional place among these institutions is occupied by the Institut für Konjunkturforschung established in Berlin in 1925, which through official connection with the central statistical office of the Reich and other important organizations both public and private is unusually fortunate in the matter of access to significant data. It compiles and publishes a number of indices which measure: (1) conditions in the field of production—orders, raw material imports, output, export of finished products; (2) the utili-

zation of available capacity in the manufacture of producers' and consumers' goods; (3) movements of stocks of commodities; (4) the turnover in foreign trade as an indication of the functioning of domestic markets; (5) future business prospects—extension of long term credits, flow of orders, unused capacity; (6) the circulation of money and credit; (7) the dynamics of capital, money and commodity markets in their interrelation; (8) price movements. It is intended that these indices in combination should present a balance sheet of the national economy and give warning of future strains and stresses which may be caused by a growing disequilibrium between the interrelated parts of the economic system.

The development of forecasting has been paralleled by a multiplication of currently maintained time series. There are now about thirty countries for which commodity price indices have been established, most of them since the World War. In a number of them current data concerning wages, employment and production of basic commodities are now being collected and reported. In the United States the current compilation of the great majority of time series now available was not begun until after 1918. Except for a few fields, of which employment is possibly the most important, the United States leads in the quantity of currently available data which are needed for economic forecasting.

In spite of the recent rapid multiplication of economic statistics theorists need further data. Some of the leading theories of business cycles cannot be tested until there are made available over a period of years reliable and comprehensive data concerning such items as incomes, savings, investments, margins of profit, stocks of goods and prices at different stages in the productive and distributive process. At present improvement in forecasting practice depends largely upon the further development of theory and upon the elaboration of its application to statistical data. There is need for clarification of the relations between cyclical oscillations, other periodical fluctuations and structural changes, and for the adaptation of the general pattern of cyclical movements to the specific conditions obtaining in each country and region.

All methods of business forecasting necessarily rest upon the assumption that there is order in the course of economic events. There are, however, significant differences of opinion as to the nature of this order. Some forecasters rely primarily upon the view that certain important phases of business activity have conformed and

will in large measure continue to conform to discoverable patterns. At the other extreme are those who believe that the forces making for disruption of previous relationships are likely to be more powerful than the forces making for their recurrence and who prefer therefore to begin by assuming that important factors in the current situation differ individually or in combination from those which have obtained in the past.

Those who are strongly impressed with the regularities among past events forecast primarily by what may be called the method of historical comparison. A simple subtype of this method of prediction which was common before the statistical age in economics and which still frequently occurs may be characterized as that of analogy. The present is thought to be like a certain previous period and the outcome of the current situation is therefore expected to be like that which occurred in the earlier instance. Examples of such reasoning in the literature of business forecasting are abundant but the analogies are typically confined so largely to surface resemblances as to disqualify the inferences from serious consideration.

A more significant form of forecasting by historical comparison is that based upon carefully delineated patterns derived by the application of the new statistical techniques. The Brookmire-Persons sequence in the major fluctuations of curves representing stock prices, business activity and credit supply is a good illustration of this method of forecasting. The principal inadequacies of this particular pattern as a basis of prediction have been those inherent in some degree in every correlation yet discovered in the field of general business. First, the regularity of the relationships for the test period itself is insufficient to make the pattern an altogether satisfactory forecaster for current use. Second, it is not certain that even such regularity of relationship as has obtained for the test period will recur in the near future. The fact that on the basis of a given lag an extremely high correlation is found between important time series does not afford a convincing basis for prediction unless the observed relation is buttressed by a rational explanation, and substantial grounds exist for the belief that this relation is not likely to be seriously disturbed during the period covered by the forecast. It is quite possible for high correlation to occur between series where the relationship is only nominal or for such correlation to be procured by unjustifiable manipulative treatment of the data. Even patterns which are known

to represent significant relations have often betrayed the forecaster at a critical moment because of the sudden injection of new elements into the situation. This is true of projected secular trends for individual industries, concerns and commodities as well as of cyclical sequences.

In contrast with those who forecast by pattern are individuals who have been so strongly impressed by the unique aspects of successive periods that they reject altogether the use of economic barometers and attempt to forecast by what may be termed the method of crosscut analysis. This method requires that each forecast represent a sort of balanced judgment based on a careful evaluation of the forces making for expansion and those making for recession. The process by which thoughtful men of affairs arrived at important forecasts in the prestatistical period must have been largely of this character. Even now the method has certain points in its favor. It is adapted to take account of factors which may be important but are not susceptible of quantitative treatment. Furthermore, it is the very nature of this method to inquire into the processes by which impulses are transmitted from one element in the business situation to another, and it may thus lead its user to avoid the pitfall of forecasting from empirical regularities unsupported by rational explanations. The forecaster by pattern may be satisfied with a superficial relationship, and the inferences he draws concerning the future may easily prove less satisfactory than those of an experienced user of crosscut analysis.

The weaknesses of the latter method, however, are as obvious as its advantages. At every step the process is essentially subjective, and there is no current objective check upon inferences so derived except the carefully measured relations that have obtained in the past. In fact, all forecasters of standing use both historical comparison and crosscut analysis; they differ only in the emphasis placed upon the one as against the other. The complexity of the flow of interrelated events compels statistical research for patterns, while the construction and use of the latter call for judgment at every step from the statement of the problem to the interpretation of the final result.

There are difficulties in the path of the business forecaster that are not likely to be overcome even by the most skilful combination of the two methods. The greater and more widespread the attention to forecasting, the greater the probable effect of the prediction upon the time and inten-

sity and possibly even the direction of business changes. Allowance can be made in advance for these probable effects, but it will be inherently difficult to estimate them accurately. The value of a forecast to one who desires it for private gain depends upon the fact that it is not generally acted upon or at least not promptly. If the reactions to a series of forecasts from a given source were general and in accord with one another, that fact itself would result in a change in the net response to predictions from that source. Since the value of a business forecast to the individual consists in part in its enabling him to anticipate his competitors in a given line of action, it is difficult to imagine the attainment of a very high degree of accuracy in forecasting competitive business activity.

Another limitation is the impossibility of eliminating the effect of human emotion upon the judgments rendered by forecasters. There is a strong tendency for the analyst to let his desires influence what he expects. This may lead him to anticipations more nearly in conformity with his wishes than are warranted by the facts; a conscious attempt on his part to resist this tendency may result in the opposite course. Those who publish their predictions may become too much concerned with their reputations for correctness and thus saddle themselves with an emotional handicap. Facts most in conflict with the prediction are likely to be minimized and those most in accord with it magnified; the situation can no longer be appraised with the required degree of objectivity, and the correctness of the forecast may thus be vitally impaired. Those who stand to gain from favorable developments are subjected to the temptation of being unduly optimistic in their predictions. Forecasting agencies eager to please their clients are under pressure to emphasize the hopeful aspects of the situation. The records of forecasting services commonly show an optimistic bias.

The soundness of predictions has an important bearing on the usefulness of forecasting for stabilizing business activity. Economically unsound forecasts may serve to prolong and intensify maladjustments rather than to accomplish their prompt correction. Whether the net effect of forecasting proves to be disruptive or stabilizing would seem to depend in the first place upon the soundness of the theory, the adequacy of the data and the effectiveness of the analytical technique which the forecasters command. In the second place, the effectiveness of forecasting in mitigating threatening economic

disequilibria depends upon the response of the business community to forecasts. In a quasi-competitive regime of the present day there is no assurance that the intensity of the response will correspond to the need for business adjustments. Nevertheless, forecasting may prove to be an effective stabilizing influence in the hands of public bodies which have the requisite power to undertake definite action designed to influence business developments; an outstanding example is the central bank, which shapes its policy of credit control on the basis of its own forecast.

The serious use of business forecasting by business executives as an aid in management is not yet general even in the United States but it is growing, particularly among the larger corporations. Certain public utilities make careful predictions both of the secular trend of their own business by regions and of the cyclical fluctuations of general activity. Railroads use short term forecasts for industries and for regions as a basis for allocating cars. A number of large industrial and commercial concerns employ economic statisticians primarily for forecasting and a great many subscribe to one or more of the general business forecasting services. In 1931 there were in the United States about thirty such services not counting government bulletins, bank and brokerage house letters and business journals which contain predictions. A few of these services attempt in their forecasts to cover every important field of economic activity; their publications are as highly valued for the information they contain as for the forecasts they present.

FOREIGN CORPORATIONS. The law of every modern state distinguishes certain corporations which are called domestic from others which are called foreign and commonly treats corporations of each class differently, at least in certain respects. But the content of the terms is not the same in all states. In common law states, undoubtedly in large part because of the influence of the theory that a corporation is a creation or fiction of the law from which its charter is derived, a corporation is held to be domestic with respect to the incorporating state, and foreign with respect to other states. In civil law states, where the concession and fiction theories are less generally accepted, various tests of domesticity are applied—where the corporation was chartered or authorized, where the acts resulting in incorporation were performed, where the center of its business operations or of administration is or where its seat is fixed by its constituting document. Different tests of domesticity may be applied to different types of corporations. Civil law states commonly treat a corporation which has received express authorization from a state as domestic with respect to such state; whereas if the authorization is not express, the corporation is treated as domestic with respect to the state in which its administrative center is located.

The conception of a corporation as a fictitious entity was welcomed in the early American common law because it was perceived to be an excellent weapon to restrain these entities, then unpopular. It was easy to deduce from the fic-

tion theory that a corporation could have no existence outside the state incorporating it. As each state of the United States has plenary incorporating power, a corporation incorporated in one state was early and still is held to be foreign with respect to all others.

Unlike the state legislatures Congress has no general incorporating power. The constitution, however, does confer on Congress exclusive power to legislate for the District of Columbia and for the territories. When Congress incorporates in the exercise of such power, the corporation is held to be domestic with respect to that legal unit of which Congress was at the time acting as a legislature. In addition it was early held that Congress could exercise the incorporating power when acting as what may be called a national legislature, in instances where such action was a necessary or proper means for carrying into execution any power conferred by the constitution upon the government of the United States. Except for the incorporation of national banks exercise by Congress of this power has been relatively infrequent and no general federal incorporation statute exists. The domesticity of corporations incorporated pursuant to this power, commonly called federal constitutional corporations, is not wholly clear, but they are undoubtedly foreign with respect to all states in which they neither carry on business nor have their administrative center.

The right of a corporation to sue outside the state incorporating it was apparently never seriously contested in the United States, but when extraterritorial corporate activity involved other action it was urged that since a corporation could not exist outside its charter state it could not act outside such state. Such a contention could not prevail in view of the demands of expanding business, and in the leading case of *Bank of Augusta v. Earle* [38 U. S. 519 (1839)] Chief Justice Taney squarely met this contention and established the orthodox American theory that although a corporation could not exist outside the incorporating state it could effectively act elsewhere by agents with the permission of the state in which the act was done. To find permission Taney resorted to the doctrine of comity, holding that in the absence of legislation to the contrary states permit acts on behalf of foreign corporations "not contrary to local policy." This has since been construed to mean acts which corporations as such are permitted to do in these states.

While this decision established the possibility

of extraterritorial corporate activity it preserved for non-charter states a wide field of control, since it made clear that legislation could withhold or condition such permission. Legislation imposing conditions upon the exercise of all or at least of certain kinds of corporate activity by foreign corporations soon became common in the states. Today many states have statutory provisions requiring a foreign corporation, even though incorporated in another state of the United States, before doing business to file a copy of its charter and a financial statement, to appoint an agent upon whom process may be served in actions against it and to pay a tax.

The effect of non-compliance with such legislation, assuming its constitutionality, is a matter of interpretation. Sometimes it is held to be merely a bar to maintaining in the courts of the state suits arising from corporate action within the state. Sometimes such legislation purports to make or is construed as making such action unlawful, with varying consequences. Ordinarily, however, non-compliance does not prevent the recognition of the fact of incorporation.

Early state legislation often dealt harshly with foreign corporations. It was argued that since permission of the state was required for activity therein any condition might be imposed on the granting of such permission. Business needs, however, required some limitation on this view and the courts soon found it in the United States constitution.

In the case of the relatively small number of federal constitutional corporations, grounds for constitutional protection are obvious. Describing these corporations as instrumentalities of the federal government the courts have held unconstitutional any attempt by states to limit or condition their extraterritorial activity. The problem of protecting corporations incorporated by the individual states has been more serious.

Prior to 1868 it had generally been thought that the commerce clause of the United States constitution applied only to navigation. This assumption was dispelled in that year by the decision in *Paul v. Virginia* [75 U. S. 168 (1868)]. In addition the court said that a state legislature could not refuse to permit the performance within the state by a foreign corporation of acts in the course of interstate or foreign commerce. Since then it has been clearly established that a state legislature can neither withhold nor condition such permission.

Since many forms of business enterprise of national scope and importance, such as insur-

ance, are held not to constitute interstate commerce, some further limitation on the power to impose conditions was needed. The extent of possible constitutional protection was limited because courts hostile to corporate activity had early decided that a corporation was not a "citizen" of any state and, before doing business or owning property in a state, not a person within its jurisdiction, in the constitutional meaning of those terms. Certain palliative doctrines have been worked out, however. The doctrine of unconstitutional conditions has been devised by the United States Supreme Court to the effect that state legislatures cannot impose conditions "violative of rights secured by the United States Constitution." Under this doctrine the Supreme Court has held unconstitutional attempts by the states to prevent the removal of suits to the federal courts and attempts to legislate in connection with the intrastate business of corporations engaged in interstate commerce, in such a way as to burden unduly the interstate business. The doctrine of unconstitutional conditions has not as yet been fully developed but it is certain that in view thereof the Supreme Court can, if it will, do much to vitiate arbitrary and unreasonable legislation. While the full extent of the protection afforded by the contract clause of the constitution is not yet clear, it is certain that a foreign corporation is entitled to protection against state legislation impairing the obligation of contracts. Furthermore, it is now established that a foreign corporation can, under some circumstances at least, be "a person within the jurisdiction" of a state and as such be entitled to protection under the Fourteenth Amendment.

Arbitrary legislation by one state with respect to corporations of other states is today probably the exception rather than the rule. This has led to another problem, that of charter mongering. It is established common law in the United States that the law of the incorporating state governs such questions as the purposes for which a corporation may be formed, the classes of stock which it may issue, the consideration for which stock may be issued, the rights and obligations of shareholders and the duties of directors. It is also established that the charter state may impose an excise tax for the privilege of incorporation and of continued existence, and, what is most important, it is at present held immaterial for all these purposes that the corporation carries on no business and has no operating headquarters within the charter state. It is not uncommon

for states to yield to the temptation to attract by lax corporate legislation incorporators of enterprises intended to be carried on in other communities and thus secure added revenue. The effect upon security holders and creditors has frequently been disastrous. An appeal to state self-respect probably cannot completely succeed; the danger remains until all states cooperate, and some states yield but little to such an appeal.

Federal incorporation has been suggested as affording relief from arbitrary legislation and unreasonable conditions on the one hand and from lax incorporation provisions on the other. Such relief could be secured only by exclusive congressional power over incorporation or control of at least such businesses as are not of purely local scope and significance. Such drastic extension of congressional power would have distinct advantages. Incorporation under federal law has proved successful in Germany and Austria and is now generally approved in the Union of South Africa. Federal legislation could protect the states' financial interests. But the dangers of centralization although often overemphasized are an important consideration. And for a complete solution it would be necessary to amend the constitution, generally a very difficult process, especially when the need for change is not obvious to the layman. An extension of existing constitutional conceptions can undoubtedly give substantial relief from arbitrary state legislation, while difficulties arising from lax corporate legislation by certain states can probably be lessened considerably through blue sky legislation, federal legislation as to interstate commerce corporations and state legislation as to foreign corporations not engaged in interstate or foreign commerce.

The position in other federal countries of a corporation domestic with respect to one constituent state and acting in another affords interesting comparison. In the Dominion of Canada the provincial legislatures have plenary power to incorporate companies "with provincial objects." Power to incorporate companies with other objects lies with the dominion Parliament, and a Dominion Companies Act is in force. A corporation incorporated under the legislature of one province is foreign with respect to all others. It may act in other provinces only with their permission, and this permission may be withheld or conditioned by legislation. Charter mongering does not seem to have caused trouble in Canada. A corporation formed under domin-

ion law may not be excluded from the provinces but is subject to such provincial laws as do not "sterilize, or affect the destruction of, the capacities and powers which the Dominion has validly conferred."

In the Commonwealth of Australia the division of incorporating power between the federal and state governments is largely the same as in the United States. The constitution (art. 51, sect. xx) gives the commonwealth the power to legislate with regard to "foreign corporations and trading and financial corporations formed within the limits of the Commonwealth," but the judges of the High Court disagree as to the meaning of the section [*Huddart Parker and Co. Prop., Ltd. v. Moorehead*, 8 Commonwealth Law Reports 330 (1908)]. As in Canada, charter mongering does not appear to be a source of trouble, but there has been agitation for a general and exclusive incorporating power in the commonwealth.

Incorporation in the Union of South Africa has been under federal control since the Companies Act of 1926. A company formed under this act cannot be excluded or its activity hampered by the legislation of any state in the union. Similarly a corporation formed under German or Austrian federal legislation may not be excluded by any of the federated states.

In the United States the common law doctrine of comity applies with equal force to corporations incorporated outside the United States. So also does the doctrine that a state can by legislation (except as limited by constitutional provision) withhold or condition such permission. The protection afforded to corporations incorporated outside the United States is, under present constitutional interpretation, the same as for corporations incorporated by the states. No legislation of any state of the United States distinguishes between corporations of other states of the union and those of foreign countries.

In England the doctrine of comity is in force in substantially the same form as in the United States. Legislation provides that foreign corporations establishing a place of business in Great Britain must file papers somewhat similar to those required by the states of the United States of foreign corporations carrying on business therein. Failure to comply involves a money penalty.

The doctrine of comity was disregarded by Belgium when, in 1844, it excluded French insurance companies from the country. In 1849 the Belgian Court of Cassation refused to recognize

the civil personality of French *sociétés anonymes*. Retaliations were threatened in France, and the dispute known as *l'affaire des sociétés anonymes* lasted until the Belgian law of March 14, 1855, and the French law of May 30, 1857, provided among other things that the *sociétés anonymes* of each nation should enjoy civil rights before the tribunals of the other. In France and certain other civil law states even today a foreign corporation can act therein only with express legislative or executive permission. More commonly civil law states distinguish between the exercise of civil and functional corporate capacities; the former may be exercised without legislative or executive permission (on a theory of comity) but the latter may not. Most civil law states through legislation, executive action or otherwise now authorize foreign business corporations to carry on activities therein. Often this legislation purports to impose conditions on the exercise of functional capacities similar to those imposed by legislation in common law jurisdictions concerning the doing of business. But the modern tendency is to treat foreign corporations differently from domestic corporations only to the extent that the different factual elements call for such treatment. The prevailing tendency of civil law states to treat a corporation as domestic with respect to the state wherein its administrative center is located minimizes the difficulties arising from charter mongering.

Constitutional protection of corporations of other countries is rare outside the United States. The only protection which such corporations have against arbitrary legislation arises from treaties and international law. Treaties between states are increasingly common; they provide for recognition of business and commercial entities incorporated in or connected in some way with one of the parties, and they permit such corporations to carry on business in the territory of the other party or parties, although generally only upon compliance with the laws of that state. They also commonly provide against discriminatory tax regulations and legislation.

International law affords very limited protection. The question of whether international law ever considers a corporation a national of any country is disputed. Most writers and judges urge that a corporation can have a nationality. Most commonly it is said to be a national either of the state in which it is incorporated or of the state in which its administrative center is located. But other tests are also advanced and in view of the lack of agreement it cannot be said

that international law treats a corporation as a national of a state or even that it treats its property as subject to a state's protection unless the corporation has been founded under the laws of the state, its administrative center is located therein, the control and enjoyment of its property are exclusively in the hands of nationals of the state, and the state has assumed permanent sovereignty over it or its property. But even though a corporation be a national of a certain state or its property be entitled to a state's protection, such state cannot insist that another state recognize the corporation or permit it to act or acquire property or rights therein. Where, however, a foreign state permits such corporation to acquire property or rights therein, it probably must allow the corporation to protect such property or rights.

In 1927 the Committee of Experts for the Progressive Codification of International Law appointed by the League of Nations adopted draft conventions to establish by international agreement rules concerning the recognition of the legal personality of foreign commercial associations and concerning their nationality and the determination of the question of their diplomatic protection.

The draft convention concerning the recognition of legal personality provided that "commercial companies validly constituted under the law of one of the Contracting States and having their actual seat in that state shall, as of right, be recognized as such in the other Contracting States" and that foreign commercial companies thus recognized should "in the territories of the signatory States be entitled to enjoy the rights resulting from such recognition and be parties to actions at law either as plaintiffs or defendants, provided they comply with the laws of the country in question." Such recognition would not imply that the companies would "be entitled to establish themselves and transact business in the territory of the other Contracting Parties or, in general, to carry on permanently the activities contemplated by their statutes."

The draft convention concerning nationality and diplomatic protection provided among other things that the signatory states should agree "that the nationality of a commercial company shall be determined by the law of the contracting party under whose law it was formed and by the situation of the actual seat of the company which may only be established in the territory of the State in which the company was formed," but that "the determination of nationality in the

above sense shall in no way affect the full right of the Contracting States to make rules as to the formal and material conditions governing the formation of commercial companies: such rules depend entirely upon the municipal law." This draft further provided that "the right of diplomatic protection and intervention on behalf of commercial companies shall belong to the State of which they are nationals under the provisions of the present convention."

FOREIGN EXCHANGE. In the language of the market foreign exchange signifies written or telegraphed orders to pay money, which are issued by merchants or bankers at one geographical point upon merchants or bankers at points having a different currency system. Taken more broadly foreign exchange designates the entire mechanism by which payments between any two points or areas operating under different currency systems are effected without the passing of actual money or of articles having an intrinsic value. The foreign exchange process is, like bank clearings in domestic finance, fundamentally an exchange or clearing of debts payable on demand or at relatively short maturity. Its distinction from domestic exchange lies in the fact that the payments cleared involve different currency systems.

The ways in which payments can be effected between two financial centers and the types of documents originated in the process are reflected in the classes of foreign exchange rates quoted. These rates state the price of a unit of one currency in terms of another currency. The principal classes of buying rates in New York for exchange on London may be illustrated as

follows: bankers' demand drafts ("sight"), \$4.86 per pound sterling; bankers' long bills, \$4.84; commercial long bills, \$4.835; cables, \$4.8625 (values arbitrarily assumed). The sight rate is generally regarded as the basis from which the others are calculated. The quotation for long bills is below the sight rate by the amount of the discount charge in London plus commissions and other charges; and commercial bills are subject to a further discount because of the additional risk. Cables command a premium, primarily because the New York seller must establish a balance in London before he can sell sterling cables. In the present illustration the premium is based on the interest charge for the six or seven days required to mail a sight draft from New York to London, although the premium may drop if New York bankers are anxious to sell off their London balances. Cables are now so commonly used between the leading centers that exchange bankers frequently use the cable rather than the sight rate as their base for calculating long rates; and it is true that the cable rate may itself react on the sight rate. But logically the price of sight documents must be regarded as the controlling factor in the rate structure, since only this class of documents is subject to neither a variable premium nor a variable discount. This rate structure moves up and down as a unit, the spread between the several rates in New York varying, other things equal, with changes in the London discount rate, except for the spread between cables and sight, which varies roughly with the New York discount rate.

The level of the sight rate itself on a given day is the product of a number of factors. Under ordinary gold standard conditions the fluctuations of the sight rate between any two centers are confined within the so-called "gold points." The numerical ratio between the physical weights of the respective currency units in fine gold or of their gold equivalents is the mint par of exchange; and the gold export or import points are determined by adding to or subtracting from this mint par the cost of shipping actual gold from one center to the other. The gold points are slightly variable, drawing together as freight, insurance and interest charges diminish and spreading apart as they increase. If the sight rate rises above the gold export point, it is cheaper to make foreign payments by shipping gold than by buying exchange; if the sight rate is below the gold import point foreign obligations will be paid by the import of gold. The

mint par has no normative influence over the sight rate; any sight rate lying within the gold point is as "normal" as any other.

Within the gold points the principal determinant of the sight rate is the demand and supply of bills originating in the exchange between countries of commodities, services and securities. In many countries the exchange of commodities is subject to strong seasonal influences, and this usually imparts a pronounced seasonal movement to the sight rates involved. A second important determinant is the relative state of the discount rates in the leading centers. A marked difference in discount rates usually induces a movement of short term funds to the high rate centers and thus brings pressure to bear on the foreign exchanges. A certain minimum differential varying in specific cases from 0.25 percent to over 1 percent is, however, necessary to produce any movement at all. Such movements of funds and exchange rates are in the nature of the case more or less self-correcting and eventually reverse themselves. The third and last important determinant is the speculative movement of funds to take advantage of anticipated changes in the exchange rates or in other money market factors; these movements are also largely self-correcting.

In addition to spot rates, or rates for the immediate delivery of the type of foreign exchange in question, the leading money markets now quote forward rates, or rates for foreign exchange of specified kinds to be delivered at a specified future date, usually one or three months ahead. The device of the forward contract enables a person who must make payments abroad at a known future date to hedge against the risk of exchange rate fluctuations in the interval. Forward transactions make commercial operations more certain and cheaper and at the same time diminish the fluctuations of the spot rates themselves by spreading out the effective demand more evenly; they also reduce the influence of genuine speculation in exchange. It is regrettable that the world's central banks as a whole have hitherto made comparatively little use of the forward markets since they offer a powerful tool of control (*see* HEDGING).

In addition to dealing in forward exchange many central and private banks quote "arrival" rates. These are the rates at which bills drawn in the local currency and mailed in foreign centers on the given day will be discounted by the quoting bank on arrival. The practise of quoting such rates protects the original buyers of the

bills from the effects of unforeseen changes in discount rates and thereby makes the relevant foreign exchange operations as a whole more certain and cheaper.

The foreign exchange market is simply one division of the general money market in each financial center. The oldest and most highly organized exchange market is that in London because of the preeminence of that city in the short term financing of the foreign trade of the world. For the same reason the exchange market there constitutes a far more important part of the money market as a whole than in any other center. Three principal groups of institutions participate in the London exchange market: the commercial banks, including the London offices of foreign banks, through which most of the bills come into the market; the bill brokers, who buy bills primarily in order to sell them again, and the discount houses, which buy bills primarily to hold them as investments; and the Bank of England, which under normal conditions operates much like an ordinary commercial bank. Through its control over internal credit conditions and discount rates the Bank exercises, however, a substantial control over the foreign exchanges and gold flows. Particularly before the war the appearance of gold drains was regarded as a conclusive proof that the internal financial situation was unhealthy and that contraction was required. In consequence of operations by the Bank for the purpose of bringing the market under control there would occur a rise in discount rates which if at all pronounced would attract short term funds from other centers; cause long bills originating abroad to be sent to cheaper markets than London for discount or, when the bills were drawn on London, to be kept by the original foreign buying bank as an investment; cause previous English finance bill loans to be closed out by the purchase of sterling sight; and in these and other ways would both increase the demand for sterling and postpone the presentation of claims against London. These changes relieve the pressure on the sterling exchanges and usually induce a favorable movement of exchange rates, and if the discount rate remains high for any length of time an inflow of gold also usually follows. The Bank has also found it possible to control specie movements to some extent by paying out light weight coins within the limit of tolerance, thus moving the specie export point farther away from the mint par; and by granting interest free loans to gold importers, thus moving the specie import

point closer to the mint par. These devices, however, are of comparatively minor importance.

On the continent the foreign exchange markets have been much less highly developed and much less easily controlled than the English, although in most cases their position has improved since the post-war stabilizations. In some countries, especially in the pre-war period, this was due to the absence of a continuously free gold market. In others, where gold convertibility at a fixed maximum price was assured, it was due to the lack of a domestic acceptance market sufficiently broad and stable to support large international operations. Moreover, since in the leading continental countries the volume of foreign trade was and is much smaller than in England, both absolutely and in comparison with the volume of domestic trade, there has been no large and steady inflow of foreign bills for discount or payment. Finally, in none of the leading continental countries before the war was the commercial banking system tightly knit and sensitive; and in none of them except Germany was the central bank able or willing to control internal credit conditions with any degree of consistency. For control over the foreign exchanges and specie flows, the central banks and governments concerned were therefore unable to rely solely on the quasi-automatic methods that had been so successful in England. They had to make extensive use of more or less stop gap devices; notably, the building up of portfolios of foreign exchange, which could be thrown into the market when the exchange rates fell too low, and the actual although unstated suspension of specie payments, a device not infrequently resorted to by France, Austria-Hungary and Russia. In the period of post-war monetary stabilization the exchange markets have been better developed and more adequately controlled, again chiefly through the use of reserves of foreign bills and balances, but it is still too soon to see clear lines of development that are likely to be permanent.

In the United States during the era of the national banking system most of the financing of foreign trade was done in sterling. There was no centralized money market adequately equipped to become an international financial center; bankers' acceptances were almost unknown, and indeed most banks were forbidden by law to make them; there was no open market for foreign bills of exchange and no central agency for rediscounting; and few American banks had foreign branches, while legal restrictions were placed

on the New York branches of foreign banks. The setting up of the Federal Reserve system changed all this and the foreign exchange division has now become one of the most important parts of the New York money market. This growth was enormously stimulated by London's wartime losses and by the diminution in the prestige of the pound sterling in the post-war years. Although New York still does not equal London as a world center for short term finance, its importance is growing steadily and with it the use of dollar exchange to finance the world's trade. In addition to the New York market small exchange markets exist in other American centers, notably Boston, Chicago and San Francisco.

The New York exchange market is less highly organized than that in London. The sellers of bills are chiefly the commercial banks and trust companies together with a few finance houses which do little but accept bills. The buyers comprise all those who wish to invest their funds in the short term money market, including the Federal Reserve Banks. Such investors may put their surplus funds either into bills or into stock exchange collateral loans. In more or less "normal" times, when the call loan market is not distorted by inordinate stock speculation, the call loan rate and the bill rate are thus tied fairly closely together, although usually with a differential against call loans. As long as the stock exchange can share command over liquid bank funds with the bill market—that is, presumably, as long as daily settlements on the stock exchange remain in force—the bill market can therefore never achieve the central position which it occupies in London. As in the case of the Bank of England, the principal means by which the Federal Reserve Banks can control the foreign exchanges is through the prior control of discount rates and general internal credit conditions. But international trade and finance and hence the movements of specie and the exchange rates play a much smaller part in American economic life than they do in the English. In consequence control of the foreign exchanges as such has been a much less important objective in Federal Reserve policy than in that of the Bank of England, and it is broadly correct to say that except during the war such control as has been secured has been a rather incidental by-product of the endeavor to control general internal conditions.

The mechanism of the foreign exchanges attracted the attention of economic writers at an

early date. The essence of the so-called specie point mechanism—namely, that a movement of the exchange rates beyond the specie points will cause an outflow or an inflow of specie—was recognized in England as long ago as the end of the seventeenth century, for example by S. Clement in *A Discourse of the General Notions of Money, Trade and Exchanges* (London 1695). But although many of the mercantilist writers were familiar with both the operation of this mechanism and the fact that there is some connection between the quantity of money and the level of internal prices, it remained for the first great English critic of mercantilism, David Hume, to weave these and other elements of doctrine into a self-consistent whole. In substance Hume declared that if a country exports more than it imports the foreign exchanges will move favorably, specie will flow in, prices will rise, exports will be checked and imports stimulated, and these changes will continue until some sort of balance or equilibrium is restored. A similar process, he held, serves to restore international equilibrium if it is disturbed by a large initial price change in any one country. This doctrine, which for the first time provided an explanation of the maintenance of equilibrium between the price systems and in the international commerce of the countries using the same metallic currency standard, became one of the corner stones of the classical English theory of international trade. Ricardo fitted it into his theory of international values and J. S. Mill elaborated it, but neither changed its essential character.

Under modern conditions, however, the acceptance of this theory presents a number of difficulties, so that in recent years few writers have been willing to subscribe to it without fairly extensive qualifications. At present disequilibrium in international payments reacts of course on the exchange rates, but it is not clear that the correction of the situation takes place in quite the way that the classical theory postulates. In the first place, commodities are no longer the only important element in international exchange: the movements of capital and services are both playing steadily larger parts. In the second place, when international disequilibrium does occur, gold is by no means the first thing to move in settlement of the adverse payment balance. Short term funds, securities and even certain standardized commodities are more sensitive to exchange rate fluctuations than gold, and their movements alone may suffice to restore equilibrium. Moreover, in recent decades the interna-

tional movements of gold have frequently been too small, and sometimes too clearly at variance in their direction with the current international payment pressure, to make it entirely plausible to regard them as the main pivot of the process of international adjustment. In a number of cases gold flows have apparently taken place as a result of prior changes in general prices and have operated merely to support a higher level that was already established. In the third place, the connection between an inflow of foreign gold or short term capital, on the one hand, and the correction of the underlying situation which produced the original international disequilibrium, on the other, no longer seems as clear and positive as the classical writers thought it to be. Under present day conditions incoming gold usually goes directly into central bank reserves, and it then may or may not produce the postulated increase in currency and credit and the postulated rise in commodity prices. Moreover, if foreign short term capital alone comes in, no effect on commodity prices need follow at all. Indeed Goschen writing as far back as 1861 explained the process of international adjustment principally in terms of the effects of exchange rate fluctuations and gold flows on the respective money markets alone, assigning to commodity prices and the balance of trade only a comparatively minor role.

As yet there is no agreement on any one doctrine that can be substituted with confidence for the strict form of the price-specie-flow theory, but the general lines which such a doctrine will take seem fairly clear. It will run in terms of the effects which an excess of international debits or credits as such and the resulting exchange rate pressure have on the volume of purchasing power currently available in the countries concerned, regardless of whether actual gold flows take place or not. Commodity price changes may be found to ensue from this condition of strain. But in many cases the mere expansion or contraction of grants of commercial bank credit, especially to borrowers who are engaged in international business, will suffice to alter the current volume of the country's international credit and debit transactions in the necessary degree and thus to restore equilibrium. If an equilibrium is not established fairly accurately and continuously between each country's international payments currently due and currently receivable, an unmanageable accumulation of demand and short term obligations on one side or the other will soon result. Either of two things may then

happen. The debtor country or the individual debtors may in effect declare a moratorium on the foreign obligations, trusting that a subsequent favorable turn will permit repayment later. This happened on a large scale in both belligerent and neutral countries at the outbreak of the World War, again in 1921-22 and once more in 1931. Or the exchange rates may be allowed to collapse in consequence of the competition of the individual debtors for media of foreign payment. When the exchange rates have moved substantially beyond the gold export point without inducing a flow of gold, the country has evidently abandoned the gold standard, at least for international payment purposes, and is entering on a regime of what is in effect inconvertible paper—even though there may still be large but unused gold reserves.

The traditional foreign exchange policy of the leading countries has been that of insuring foreign exchange stability; that is, it has been aimed at keeping the exchange rates within the gold points, while internal prices in each country have been left to adjust themselves to the successive impacts of changes in domestic and foreign conditions. An alternative policy, the possibility of which was not clearly realized until recently, is that the internal price level in each country be kept stable and the foreign exchanges left to fluctuate beyond the limits usually imposed by the gold points. While the second alternative, at one time strongly advocated by J. M. Keynes, has been rejected by most students and bankers for practical reasons, the first system also has grave practical defects. Under present day conditions exchange rate movements and gold flows can no longer be relied upon to correct financial conditions and price levels in the countries concerned, so that grave disequilibrium in current international payments is always a possibility. Even under the most favorable circumstances no central bank can always be sure of gaining control of the situation, because the requisite economic power is not continuously available; and some central banks are legally handicapped as well. Moreover, the greater the success of the central bank in stabilizing the foreign exchanges, the more surely will it find itself stimulating internal price fluctuations. For the economic rhythms of the several countries are dissimilar; and if the foreign exchanges, which are a principal connecting link, are held rigid, then the dissimilarities must work out in the form of changes in the value of money within the several countries

It is impossible for any one country to solve this dilemma alone, for no one country has sufficient economic power to force all the others into its path. The solution, so far as one can be found, probably lies in that continuous cooperation between central banks which is at last beginning to find favor. If each leading central bank works constantly not only to stabilize conditions at home but also to harmonize domestic developments with those abroad, then indeed fluctuations in exchange rates, internal prices and internal business activity will not be avoided, but the acuteness of the present international differences can probably be lessened and the amplitudes of the fluctuations themselves be reduced. To accomplish these ends, however, the central banks will have to adopt far more aggressive and self-conscious policies of general control than most of them have hitherto been willing or able to subscribe to; and they will have to become seriously concerned with the welfare of the world as a whole, themselves included, not merely with their own immediately perceptible national interests.

What has been said up to this point applies primarily to foreign exchange between countries on a common and full metallic standard. When the currency standards are dissimilar, foreign exchange involves a quite different range of problems. Three main types of relations are of practical importance: the gold-exchange standard, gold-silver exchanges and gold-paper exchanges.

The essence of the gold-exchange standard is that the country concerned, too poor in gold or silver to trust itself to a full convertible metallic standard or for other reasons, ties or "pegs" its currency and its foreign exchanges to a foreign currency, usually gold. The exchanges are allowed to fluctuate within narrow limits, which correspond to the usual gold points. At the "export" point the controlling authority will sell foreign exchange in unlimited quantities; at the "import" point it will buy. A purchase of foreign exchange by the controlling authority expands the local currency, while a sale contracts it, so that the local currency is tied to the movements of foreign trade much as under a full gold standard, although often with less sensitivity and less accuracy. The great advantage of this arrangement is its cheapness. It makes largely or entirely unnecessary the movements of gold to and from the country concerned, thus eliminating gold shipment charges; and it enables the central authority to keep all of its

foreign exchange reserves in the form of interest bearing assets. But the successful operation of this system requires the maintenance of a large fund in the foreign center against which the controlling authority can sell. If a protracted adverse balance of payments exhausts this fund, then unless more money can be borrowed abroad the system breaks down and the exchanges suddenly collapse.

Since the war a modified form of gold-exchange standard has been adopted by a large number of countries, especially in Europe. These countries have maintained at least nominal gold convertibility for their currencies, but because of their own financial weakness and the uneven post-war distribution of gold stocks they have been unable to keep all of their minimum central bank and currency reserves in the form of gold. The remainder has been kept in the form of foreign bills and balances with central banks payable in gold currencies. This procedure can easily result in a dangerous multiplication of central bank claims against given stocks of gold; in a consequent shrinkage in percentage terms of the ultimate gold base underlying the aggregate of the central bank obligations and the international exchanges involved; and in the exposure of the countries holding central bank reserves for others to severe and largely uncontrollable drains of gold to the rest of the world. This latter danger arises from the fact that financial conditions in the country whose currency is used as the base are not influenced by changes in conditions in the pegging country in the same way or to the same extent that they would be under a full gold standard. In the one case if the relative change in conditions is large the base country loses or gains gold; in the second case all that need happen is that the volume of foreign claims on the base country is increased or decreased. If the pegging countries chance to be important or fairly numerous, a serious international disequilibrium in price relations and business movements may develop without bringing corrective forces into play. What can then happen has recently been demonstrated with convincing force. In the last few years, England especially has been the depository for foreign central bank reserves of this sort. The sudden withdrawal of a large part of these and other demand or short term balances held by foreigners in the summer of 1931 and the simultaneous freezing of many of England's own balances and short credits abroad were the proximate cause which forced England off

the gold standard again in September of that year. The resulting fuller appreciation of its dangers may well lead to an extensive liquidation of the post-war form of gold-exchange standard in the more important countries which had resorted to it.

Exchanges between two countries one of which is on a gold standard and the other on a full value silver standard operate much like ordinary gold exchanges as long as the market ratio between gold and silver does not change. The chief difference is that gold cannot enter directly into the currency of the silver country but must be sold in the market there for currency; and vice versa with respect to silver. When the market ratio between gold and silver changes, however, the exchange rate shifts to correspond with the new market parity. If the change is large, general prices and the variable classes of money incomes must also alter in one or both countries, with a resulting painful period of readjustment and with undeserved profits or losses to exporters or importers during this period. In the case of an unrestricted bimetallic standard the changes just outlined take place whenever the market value of silver is below the mint value and the country is actually on a silver standard. The case of an arbitrarily overvalued silver standard is governed by the arrangements in force at the time. If the government successfully controls the exchanges, the case is analogous to that of the gold-exchange standard. If it does not, the case is more nearly like that of an inconvertible and uncontrolled paper currency, except that the exchange rate cannot fall below levels corresponding to the market value of the actual silver in the currency unit itself.

In the case of exchanges between two countries, one or both of which are on an inconvertible and uncontrolled paper standard, there ceases to exist any necessary limit on the fluctuations of the exchange rate. It has occasionally happened that an uncontrolled inconvertible paper currency remains stable, but in the great majority of cases the currency eventually fluctuates and depreciates to a greater or less extent. This happened in the case of nearly all the leading countries which went on an inconvertible basis during the war, with the exception of the Swedish currency, which was for a time at a premium not only in terms of foreign exchange but also in terms of gold. When depreciation takes place, the phenomena encountered vary with the degree and the rapidity of the depreciation, and it is impossible to find any one formula

that fits all cases. The exchange rates usually move before internal prices and thus place a bounty on exportation as the depreciation progresses or a penalty when improvement is taking place. But even this relation does not hold in the case of the more extreme and chaotic depreciations.

During the war the Swedish economist Gustav Cassel revived a doctrine probably first formulated by John Wheatley in *Remarks on Currency and Commerce* (London 1803) and offered it as an explanation of the phenomena of depreciation. Summarily stated, this theory, which is called the purchasing power parity doctrine, declares that the rates of foreign exchange are governed by the relative purchasing powers of the currencies of the countries concerned, these purchasing powers being measured primarily in terms of internal commodity prices; and that the levels of prices themselves are governed primarily by the quantities of currency and credit in circulation. The corollary conclusion then is that the prime mover in the process of inflation and deflation is the variation in the quantity of the circulating medium. But this doctrine failed when applied to the more extreme cases of depreciation. It also ran foul of serious logical difficulties in statistical application. Such difficulties occurred in establishing comparability in the commodity groups selected as the basis of measurement, in insuring an intelligible representativeness of the selected groups and in allowing for changes in the composition of international trade in the interval elapsing between the base period and the period selected for making the comparisons.

Other theories developed during and after the war stressed other factors as determinants. In France Bertrand Nogaro developed a view opposite to that of Cassel: he held that the foreign exchange rates govern the domestic price level and that the latter governs the amount of currency and credit required. This doctrine too failed, however, to fit the apparent facts in a number of actual cases. Charles Rist, concerned more with the general causes at work than with specific sequences, placed his chief emphasis on budgetary equilibrium and disequilibrium as the ultimate controlling factor. In the United States Allyn Young emphasized the importance of speculation in the broad meaning of the term.

The truth of the matter appears to be that neither prices nor the exchanges can properly be regarded as the causes of general movements of the types here under consideration, nor can

the levels of either be regarded as the result of the other's fluctuations. Rather, the fluctuations of both are products of common antecedent conditions: sometimes of movements in private commercial and banking operations alone, more commonly of movements in governmental finance. When the depreciation becomes extreme, however, the determining factor is simply the growing general loss of confidence at home and abroad, and the resulting flight from the currency affected. If the flight assumes panic proportions, as it did in Germany, the old currency is simply abandoned and a new one is eventually put in its place.

FOREIGN INVESTMENT. Foreign investment is the export of capital to a region or regions under a political authority different from that ruling the country in which the owner of capital resides. In the vocabulary of business as well as in theoretical discussions the term foreign investments is used just as loosely as foreign trade; the former includes not only every form of capital migration across the political boundary but also every form of credit extension by the mother country to a colony. Like capital invested at home, capital exported abroad may be invested in a variety of ways. They comprise short term trade and finance credits; long term

credits at fixed interest granted by private investors and investment companies or by public bodies including the government; investment in foreign enterprises through the purchase of shares; the establishment or acquisition of plants abroad to serve as foreign branches of a domestic enterprise or to function as an independent business on foreign soil.

The form which foreign investments assume finds no direct reflection in the country's balance of international payments; in this balance export of capital and the payment of interest appear as debit items, and import of capital and the receipt of interest from abroad as credit items. The differences among the various forms are important, however, in many other ways. They determine the duration of creditor-debtor relations; they throw light on the use made of the capital received and indirectly also on the ability of the debtor to repay his obligations; their influence on the national economies of the parties involved and on the international economic situation as well as their possible political repercussions are quite different.

The political factor is of course most prominent in intergovernmental loans. Yet even where the public authority is involved only as debtor or only as creditor it is subject to many forms of political pressure, with the result that foreign loans to or by a government have in the past produced many international complications. The political aspects of capital export are more attenuated in purely business transactions, whether they assume the form of direct investments or of credit extension by one private party to another. The prominence of the political aspect in transactions of this sort depends less upon the form of the investment than upon the political relations obtaining between the countries concerned. The intrusion of extra-economic factors is most likely where investments are made in countries suitable for colonial exploitation or annexation and where considerable amounts of capital move between countries in which questions of political and commercial alliance play an important role.

The difference between public and private credits is not so important in judging the economic significance of foreign investments. The essential criterion in this connection is the purpose—production or consumption—for which the credits are used. In the case of commercial credits and direct investments the use for production is always at least contemplated, while with public credits it is only too often a question

of finding means to cover temporary deficits in the budget or of getting long term loans for investments which are on the whole non-productive, such as the manufacture of armaments, the construction of military railways, public buildings and the like. Another important difference is that between the purchase of securities of foreign business enterprises and direct participation in foreign business through the establishment of plants abroad; this difference has a vital bearing upon the liquidity of the foreign investment.

International capital movements are closely linked to international commodity movements. Theoretically the net export or import of capital must be accompanied by an export or import balance in the movement of goods, services and bullion. It is not so easy, however, to determine in each specific case whether the causal relation runs from the movement of capital to that of commodities or in the opposite direction. Several conceivable relationships should be clearly distinguished. The movement of capital may be the direct consequence of commodity movements. The export or import of commodities gives rise to financing through banks, which ordinarily takes the form of short term documentary credits. Financing of this type enhances the volume of international trade, since it makes possible a number of commercial transactions which would not take place without such assistance. New countries poor in capital and in the post-war period many industrial European countries have been regularly dependent upon the financing of their foreign trade by foreign institutions. The volume of international short term credits employed in financing foreign trade is very large—it amounts at present to from \$4,000,000,000 to \$5,000,000,000. Occasionally foreign trade may be supported also by intermediate and long term credits extended directly or indirectly by the government.

Commodity movements may also result in long term advances to foreign countries. One instance of this is the so-called tied investment, when the loan is granted on condition that its proceeds be spent in the lending country. The volume of such loans, however, is relatively insignificant, for the conditions attached to them raise the price of credit to the borrower.

Even where there are no formal restrictions of this type long term loans may be very intimately linked to commodity movements when credits are granted for the purpose of enabling

the foreign purchaser to pay for his past commitments or future orders of equipment and raw materials. In the era of railway building, when English capital was exported to the continent and overseas, loans were generally issued in anticipation of orders or after orders had been given or promised to English manufacturers, although the contractor or the manufacturer of rails, engines and other equipment usually was not closely allied to the institutions exporting capital. This relationship is illustrated in a particularly striking fashion by the English loans to India in the fifties and sixties; it may also be clearly traced in the financing of the railway building of the same period in France, Italy, South America and elsewhere. Moreover, it is clear that the export of capital from England to the continent and the United States in the last quarter of the nineteenth century and to Canada and Australia in the nineties was possible on so large a scale only because the provision of capital generally went hand in hand with the export of commodities needed by the borrowing countries and not obtainable elsewhere on equally advantageous terms. During that period England was the leading industrial country, if not the only one, in the world; railway construction and similar fixed investments of capital in the new countries were therefore dependent upon the supply of capital goods by English manufacturers. Thus the two types of export—of capital goods and of capital funds—were closely interrelated even in those cases where the sale of goods for export did not precede the granting of loans or was not anticipated at the time. In addition, English exporters of commodities frequently paved the way for the flotation of foreign issues on the London market. Consciously or unconsciously the English banker and the English manufacturer supported one another, for the movements of capital funds and of capital goods were interdependent.

For other reasons the movement of funds and the export of commodities are similarly interrelated in the young countries of a predominantly agricultural character, in which the payment of charges on foreign debts is taken care of by the export surplus of raw materials to the extent that it is not covered by new loans. In this case too it is difficult to determine which is the cause and which the effect: the country supplies raw materials for the world market and is thus put in possession of foreign exchange necessary to pay interest on, and the amortization instalments of, loans contracted abroad.

The situation is quite different in a country

whose net balance of capital imports and exports is not directly and naturally related to compensating surpluses or deficits on the visible or invisible items of the balance of trade. If such excess or deficiency in the movement of funds is not caused by the anticipation of movements in the opposite direction in the near future, its very existence is *prima facie* evidence of the presence of extraneous factors. In such cases the movement of capital is the primary fact and the movement of commodities its consequence. The relationship between the two is the sum and substance of the "transfer problem," the solution of which according to the classical theory of the balance of payments as developed since the time of Hume and Thornton consists of certain adjustments in the price levels of the countries concerned, these adjustments being brought about by the movement of specie or its anticipation and the corresponding expansion or contraction of credit.

A net balance in the capital account of a country is apt to induce a compensating movement of commodities only if this balance is too large or persists for too long a time to be offset by the shipment of gold or of substitutes for gold, such as paper currency accepted as the equivalent of gold, or by foreign finance credits. Even in the long run a favorable balance on the capital account is likely to determine commodity movements only in a comparatively narrow range of cases. At present a considerable part, perhaps much the greater part, of international movements of long term capital, is balanced by interest payments. The export of capital, for example, from England, France and the United States now means to a considerable extent the reinvestment of interest payments received from abroad in the sense that the proceeds of these payments offset new foreign investments in the country's balance of international payments. Furthermore, the various forms of capital movements may be reciprocally compensated; thus in England and the United States the export surplus of long term capital is offset by an import surplus of short term funds. Even where a net surplus or deficit in the capital account affects the country's balance of trade it does not necessarily lead to an increase in the volume of its foreign trade, since a needed readjustment in the trade balance may be brought about not only by an increase of exports but also by a reduction of imports. Nevertheless, because of the close relation between the movement of capital and that of commodities it is an expansion in exports rather than

a decrease in imports that is usually effected.

The history of international capital migrations may be properly begun with the mediaeval period, when foreign short term credits were granted at the fairs of Champagne, the influx of Peter's pence to the papal fisc was financed by Florentine bankers, and foreign moneys were occasionally involved in credits to governments or crowned rulers. In the sixteenth century the Fuggers of Augsburg functioned as a great international investment house which financed not only copper mines in northern and central Germany but also silver mines in Hungary and the military activities of the Hapsburgs throughout Europe. Numerous instances of similar international finance are scattered through the history of Europe in the seventeenth and eighteenth centuries. The war needs of rulers furnished the typical occasion for the movement of capital from one country to another. Intermittent at first, this type of financing ripened in the second half of the eighteenth century into a continuous activity, monopolized for the most part by Dutch bankers. Antwerp and Amsterdam were then the leading international credit markets of the world; they absorbed, for example, the major share of British government obligations. After the Napoleonic wars leadership in finance, as in industry and commerce, passed to Great Britain, which retained it for nearly a century. Other countries reached the status of large net capital exporters much later: France in the sixties, Germany by the beginning of the nineties and the United States, which is now challenging British supremacy in this field, only in the twentieth century. The Netherlands, Belgium, Switzerland and occasionally Sweden appear in the world market as exporters of capital on a smaller scale.

The growth of English foreign investments, the volume of which practically doubled in the thirty years preceding the World War, is indicative of the rapid expansion of capital export since the industrial revolution. The volume of such investments more than doubled in the thirty years preceding the World War; in 1914 they were valued at \$20,000,000,000 and constituted about one fourth of the national wealth of Great Britain. The absolute increase of English income derived from such investments was greater than that from domestic investments, and the rate of its growth exceeded that of all the other portions of the national income. This enormous stream of capital, which enhanced the productivity of the world economy in many ways, was marked for its rather uneven flow: periods of intensive export

of capital were followed by periods of slower capital movements in a cyclical sequence. As seen over longer periods of time, however, the process was fairly continuous: the export of capital by the "rich" nations furnished in other countries the basis for capitalist development and in this sense raised their economic status. More specifically, it was foreign capital that made possible the extension of modern transportation facilities. England is the only country which has built its railways with its own capital; elsewhere foreign aid has been indispensable. Dependence upon foreign capital was equally great, although not as clearly marked, in the whole process of colonial expansion, in the opening up of new agricultural regions and in the stimulation of a great variety of industrial developments, particularly where the latter required relatively large amounts of fixed capital.

In the nineteenth century and in the twentieth until the outbreak of the World War capital export served for the most part the purposes of industrial and commercial expansion. The interest of the capitalist was focussed on each new country as soon as it was prepared to receive capital needed for its economic development. Even the large credits which were apparently motivated by purely political considerations, such as those intended to promote a policy of alliances, were also calculated to yield handsome profits and were in most cases accompanied by the economic upbuilding of the capital importing countries. Yet certain specific features and variations from time to time may be noted in the geographical distribution and the character of foreign investments of every important creditor country.

Great Britain is perhaps the most striking example of a creditor country whose investments in foreign fields were activated almost entirely by the search for greater returns. The distinguished history of British foreign investments began after the Napoleonic wars with the financing of the French war indemnity and the extension of credits to other continental states; this was the period of the first painful experiences with Greek, Spanish, Portuguese and similar foreign loans. At the same time came the first attempts to finance on a large scale mining enterprises in South America. Later British capital turned to the colonies and to the United States. The crisis of 1825 and particularly that of 1837 and that of 1847 were, in so far as the City was involved, caused by the defaulting of certain of the United States and of certain South American countries or by the collapse of great mining

and plantation enterprises. Beginning in the forties the foreign investments of Great Britain comprised over a half of the annual additions to its capital. From the forties until the nineties British capital abroad addressed itself primarily to railway building: first on the European continent from France and Belgium to Russia; then in North and South America, India and elsewhere. To this was soon added investment in other enterprises, among which mines and plantations of all sorts appeared particularly attractive to the English capitalist; iron and textiles were the principal fields of industrial investments. As compared with these investments, loans to foreign governments played a rather minor part.

With the stupendous rise of capital export the English investor tended increasingly to neglect domestic securities. As new countries and continents were opened to capitalist development the capital of England, practically the only country with a surplus of capital at the time, was naturally attracted by the enormous new opportunities for profit making. Investment abroad was further stimulated by Great Britain's unchallenged domination of the seas, which was assumed to provide political "security," and by the adoption of a free trade policy, which furnished the economic and psychological prerequisites for broadening the international outlook of the British. At the same time domestic industry, which had already passed the stage of rapid development characteristic of its early phases, could finance its further progress, even when it involved the transition to large scale production, through the time honored private channels of capital supply. Domestic securities therefore competed with foreign only in the bond market, while in the expanding stock market foreign dividend issues experienced little competition from English industrials.

In the same period London became increasingly important as the capital market of the world. Among the factors responsible for this development not the least important was the location in London of a highly developed banking system specializing in the financing of international trade. The "merchant bankers," originally export and import houses which had specialized since the end of the eighteenth century in the international acceptance business, have won for London a well nigh monopolistic position in this field. Long term foreign loans were soon added to the short term credits and in the course of the century the apparatus for underwriting and

distributing large security issues was both enlarged and perfected. A number of London houses specialized in the risky but lucrative business of underwriting foreign issues, while the distribution of the securities was in part delegated to another system of specialized firms with extensive connections for placing them with the ultimate investor. The fact that since the nineties investment trusts and similar organizations, which make a business of investing the savings of the general public, were not averse to the purchase of foreign securities also helped to build up the London market. It is even more important that the highly organized London Stock Exchange has been open to all issues providing they are large enough and command sufficient interest to promise a sizeable turnover to stock jobbers and brokers. There was no government and no enterprise whose need for capital could not be met to some extent in London and there was no type of security to which the London market would be entirely closed. Combining a well developed and articulated financial organization with skill based on long experience and intimate knowledge of the finances of foreign governments and private enterprises, London assumed before the World War the position of a central world market for both short term money loans and long term capital investments.

Since the English investor in foreign securities was actuated primarily by considerations of gain, he tended to employ his capital where it would be most productive—in the opening up of new areas, in the exploitation of untouched natural resources, in the building of new channels for international economic intercourse and the like. Safety of principal and the prospect of a fixed income yield which would lead to investment in government obligations played a minor role. Securities of the rentier type became, however, more important since the nineties, when the small investor came to be an important factor. Thus by 1914 about 30 percent of British foreign investments consisted of government and municipal issues. There was also an increase in the proportion of investments represented by fixed interest obligations of British dominions and colonies, which by 1900 attained the rank of gilt edged securities. It was important in this connection that by the Colonial Stocks Act as revised in 1900 the issues of colonial and dominion governments which were duly registered in the United Kingdom and observed the applicable Treasury orders were made eligible for inclusion among "trustee" securities. After 1900

and particularly in the five years preceding the war the annual export of capital to dominions and colonies exceeded 40 percent of the total amount of new foreign investments. On the whole the export of capital from Great Britain was little influenced by political considerations and was not accompanied by the imposition of political limitations upon the borrowers. Only during one period was the outflow of considerable amounts of capital stimulated by political means; during the third quarter of the nineteenth century the home government guaranteed the payment of interest on the securities of railways and other public utilities in the British colonies, thus burdening the colonial taxpayer for the benefit of the British contractor and investor.

If the export of capital from Great Britain was guided solely by business considerations, it was natural that the growth of British foreign investments and commercial expansion into foreign lands went hand in hand. At least until the seventies the British exporter and manufacturer paved the way for the flotation of foreign securities in the London market, directly by providing the initial subscription for new issues in order to assure the investor, and indirectly by creating the need for short term financing and thus helping to develop and maintain the necessary banking apparatus. Even where the British industrialist and merchant were not directly involved there was always an intimate connection between a piece of foreign long term financing and the commercial interests of the island. After the seventies the situation remained essentially unchanged, although with the increase in importance of foreign and colonial government obligations and with the influx of British capital into the industries of the United States British investments abroad were at least in part emancipated from a direct connection with commercial expansion.

French foreign investments began in the middle of the nineteenth century, reached a respectable volume in the sixties and, after a recession caused by the payment of the war indemnity to Germany between 1871 and 1875, increased rapidly since 1885. They had doubled in the twenty years preceding the World War. In 1914 France occupied second place among the capital exporting countries. About 15 percent of its national wealth was in the form of foreign investments, which were valued at \$8,700,000,000. Paris was then the cheapest of the international money markets, since the capital requirements of France, limited by the comparatively slow rate of

industrial development and by the predominance of small scale production, lagged appreciably behind the growth of savings of this industrious and thrifty nation. The bulk of French foreign investments was composed of securities of two types: government or government guaranteed issues, which appeal to the typical rentier, and to a considerably smaller extent securities of enterprises in politically disturbed or financially unstable countries, paper with a high speculative risk, appealing to the imagination of the *faiseurs*. The numerous class of small French investors was and still is influenced to an extraordinary extent by apprehensions of war and is intent upon "safe" forms of investment easy to turn into ready cash. The French export capital, which in the years immediately preceding the World War averaged about \$250,000,000 per annum, was thus interested less in investments of an entrepreneurial type than in securities with a fixed yield. This striking difference between the French and the English may, however, be easily exaggerated, for a considerable fraction of French foreign assets consisted of shares in all sorts of business undertakings in Russia, the Near East and Latin America, and even the foreign government bonds or private obligations with government guaranty held by French capitalists represented in many cases productive investment. Of the \$2,200,000,000 that France had invested in Russia certainly more than half was tied up in "productive" enterprises.

Paris was the largest market in the world for foreign government securities. The continuous dependence of the French government on large long term loans and the consequent stimulation of investment in government bonds naturally redounded to the advantage also of foreign government issues. The organization of French banking assisted in the same direction. The failures of the earlier institutions of the *Crédit Mobilier* type, which combined commercial banking with the long term financing of industry, have educated both the public and the banks in prudence and caution. The large commercial and savings banks distribute only those securities which may be classed as marketable and especially as "safe" government issues. The issue and placing of shares of industrial enterprises are therefore concentrated in the hands of investment banks (*banques d'affaires*); their distribution facilities, however, are not so comprehensive as they might be for they have no contact with the numerous class of depositors in the commercial

banks. Thus while bonds are placed predominantly through the commercial banks, the placement of shares and stocks is largely dependent on the Paris and provincial exchanges, which represent a very much smaller market. The predilection of the French market for government securities is reenforced by the conservatism of the small French investor, who hardly knows what shares are and to whom a government guaranty seems the best warrant of economic safety. Conservative and cautious, with a strongly marked liking for some nations and an equally pronounced aversion to others, the French investor is extremely susceptible to the propaganda of the banks, the press and the government, an opportunity which has been exploited with considerable skill. Since the eighties Paris has thus become the favorite market for the issue of national and municipal securities of those countries which have enjoyed intermittently or continuously the favor of the French public—the Latin countries in Europe and South America, Russia, the Balkan States, Turkey, occasionally also Austria-Hungary. Consequently about half of the foreign investment of France was active in countries which either were France's allies during the World War or had been expected to be; and about a third of the total foreign investments that this thrifty nation had built up in two generations were lost as a result of the war.

Since French holdings abroad have consisted for the most part of safe and politically desirable issues, the connection between capital export and commercial expansion so characteristic of British foreign investment is important only for a minor portion of the French. Although one of the arguments for the acquisition of new colonies propounded by the imperialist minister Ferry was the opportunity they would afford French capitalists for profitable investment, comparatively little capital went to the French colonies. Despite the guaranty by the home government of colonial government issues, the prohibition of investment by foreigners in the mines and railways of the colonies, and the propaganda in the press scarcely one eleventh of France's capital holdings abroad represented in 1914 investments in its colonies. Except for Algeria and Tunis their commercial and industrial development under capitalist auspices proceeded very slowly.

Export of capital from Germany began in the eighties and later grew at a higher rate than that from France. By the end of the pre-war period

German foreign investments amounted approximately to \$6,000,000,000. As compared with the French the German investor in foreign securities was less easily swayed by political considerations or by prospects of a fixed return; similarly the proportion of German foreign holdings represented by direct investments was much larger than the French. As distinguished from the English the expansion of the German capital export was more closely linked to the activities of the domestic banking system. Since the eighties German commercial banks, which functioned also as investment houses in the domestic capital market, were active in the promotion of foreign investments. They placed a part of their own funds in foreign enterprises, such, for instance, as the Bagdad Railway or the Banca Commerciale; they financed the industrial and commercial expansion of German enterprise in foreign lands; and they participated in international banking syndicates in floating large issues. The financing of foreign undertakings was often done indirectly through subsidiary banking institutions in foreign countries (*Auslandsbanken*) which handled financing of all kinds along with the international acceptance business. The export of capital appealed to the German banks for two reasons: they were attracted by the profits that were to be made in the underwriting and distribution of large international issues, or they took on foreign business in order to assist the affiliated industrial concerns in securing foreign markets for their products or reliable sources of raw material supply. The Berlin, Frankfort and Hamburg banks floated on the local markets state and other public obligations as well as real estate securities and placed them with the ultimate investors through their branch offices or the affiliated smaller banks. The mainstay of this enormous expansion in the last analysis was the German saving public, which the securities reached by way of the exchanges and the widespread nets of bank branches; unlike the French, it included a considerable percentage of buyers interested primarily in the speculative value of the securities. The pre-war German market for foreign securities was for the most part free from direct political pressure. The influence of the banks was vastly more important than that of the government, since they controlled most of the capital export.

In addition to Great Britain, France and Germany, the principal exporters of capital before the war, mention must be made of Belgium,

whose banking and investment houses pursued a policy similar to that of the German institutions, and of the Netherlands, whose foreign investments were largely concentrated in the Dutch colonies. Appreciable amounts of capital were also exported from the debtor countries, i.e. those which borrowed abroad more than they lent, such as Russia, Austria-Hungary and particularly the United States. While at the outbreak of the World War the United States owed abroad something like \$6,000,000,000, the American foreign investments, placed for the most part in Canada and Central America and to a smaller extent in South America and China, amounted to \$2,500,000,000.

During the World War and the subsequent period of inflation the magnitude of foreign investments, their distribution between the creditor and debtor countries and the direction of the international movements of capital were radically changed. Except for reparations and inter-allied debts, international indebtedness was considerably reduced, partly because of debt repudiation, failure of the debtors or liquidation of the property of enemy aliens and partly because of debt repayment and the depreciation of foreign balances. English ownership of capital abroad was reduced by about a quarter, mainly through the repatriation of American securities. The French have lost about a third of their property in foreign investments by the state bankruptcies of Russia, Austria-Hungary and Turkey. Most of Germany's foreign investments were either lost or repatriated.

After the restoration of normal international economic relations in the post-war period the export of long term capital was resumed, but on a much smaller scale than before the war. While in the years immediately preceding the war the net export of long term capital, excluding interest payments, averaged some \$2,000,000,000 or \$2,500,000,000, the corresponding average for the period from 1924 to 1930 can scarcely have exceeded \$1,500,000,000. The status of Germany changed from a creditor to a debtor nation. It had to rely in part on foreign financial assistance for economic reconstruction, the reorganization of its currency and banking system and the payment of reparations and interest on the post-war foreign loans. To a certain extent also it financed its post-war investments abroad through loans from other foreign countries. In the balance Germany borrowed abroad from 1924 to the middle of 1931 about \$1,200,000,000 on short term and about \$1,900,000,000 on long

term; at the same time it paid more than \$2,400,000,000 in reparations. The export of French long term capital was resumed only with the stabilization of its currency in 1928 and has since then fluctuated between one half and two thirds of the pre-war level. The export of English capital averaged about \$500,000,000 per annum, which is slightly more than half of the amount exported in the last pre-war years. The United States has become a creditor nation on a large scale with an annual net capital export averaging about \$600,000,000. Russia has for all practical purposes ceased to be a debtor nation, and since the war no foreign nation has placed a new investment of any magnitude in China. On the other hand, there has been an increase in the capital requirements of the new countries and colonial regions, particularly of Canada and the Latin American states.

The decline in the international movements of long term capital was probably compensated by an expansion in the volume of short term funds. These two types of capital often move in opposite directions: countries exporting long term capital receive short term funds from abroad and vice versa. Thus while the long term foreign investments of the United States reached by the end of 1930 about \$15,400,000,000 gross, approximately \$3,000,000,000 in foreign short term credits has been fairly steadily invested in the New York money market; of this amount only from one half to two thirds is offset by American short term credits abroad. While the aggregate foreign holdings of Great Britain have in this period risen to the pre-war level of \$20,000,000,000 in round numbers, the English market in the early part of 1931 used something like \$1,200,000,000 in short term credits from abroad, particularly from France, to finance international trade and to assist banks in Germany, central Europe and elsewhere. Most of the continental countries are in the balance debtor nations for short term credits. France, however, is estimated to have from \$3,000,000,000 to \$4,000,000,000 net in short term investments abroad. Switzerland, the Netherlands, Belgium and to a smaller extent Sweden and Czechoslovakia also appear as creditors in the international money market.

Both the decline in long term capital investments and the increase in the movement of short term credits in the post-war period are due to the same economic and political causes. The primary factor in this context is not the cyclical movement of business conditions—although the

net result is affected to some extent by cyclical factors—but rather the uncertainty of the political situation throughout the world, especially in Europe and in China and of late also in South America. The consequent increase in the cost of capital to the debtor countries has not, however, affected the demand for it to any considerable extent; such clearly marked inelasticity of the demand for capital, which is partly responsible for the growth of short term indebtedness, is another typical post-war phenomenon, since it is caused by factors peculiar to this period. Among them should be mentioned reconstruction and restoration of a “normal” capital equipment in most of the belligerent countries, paper money and gold inflation, exaggerated protectionism and finally the unusually pronounced speculative activity which between 1926 and 1929 culminated in a boom of extraordinary intensity in practically every important country.

Before the war capital was exported in order to open up new and develop backward regions; to a considerable extent such international movements of capital constituted one of the important prerequisites for the settlement of entire continents. After the war a good deal of the exported capital ceased to perform such functions. Old countries, quite densely settled and well supplied with modern industrial and transportation equipment, of which Germany is the archetype, became important borrowers in the international markets; by paying higher interest rates they competed successfully with debtor countries of the pre-war type for the available supply of capital. Interest rates in the world market for the best bonds of the principal debtor countries have been increased thereby from the pre-war level of 5 percent to from 7 to 9 percent and occasionally to an even higher figure. In addition to the development of new capitalist economies international capital has thus assumed the function of reconstructing old capitalist countries. Under this head may also be considered the import of capital in order to increase the monetary gold stock of the country, a device upon which most of the European and South American states had to rely in rebuilding their shattered currency systems. A considerable increase in direct participation in foreign undertakings was indicative of a change on a somewhat different level. Many new and even most of the old states, obeying a quickened impulse toward economic self-sufficiency, raised their tariff walls far above the pre-war level. Under these conditions the drive for economic expansion led to the formation of

many international combinations, which in the aggregate constitute for the European peoples an embryonic system of “superstate” organizations. During this period international capital movements were also favored by the policy of bounties of various types, such as export credit (*q.v.*) and government subventioned insurance of foreign credits (*see* CREDIT INSURANCE), and by the competitive struggle for raw material supplies, which led on occasion to intensified capital investments in foreign jurisdictions. Also of considerable significance during this period were the sudden changes in the volume and direction of international movement of short term funds. They were due to the peculiar abnormalities of the post-war era: the flight of capital under conditions of political or monetary instability; the transfer of funds to foreign markets in order to escape “confiscatory” taxation or impending “socialization,” and in order to profit by the increase in the value of foreign currency due to its stabilization or by the unusual opportunities for security speculation. Such movements were purely temporary and their direction was apt to be reversed overnight.

Capital export from France in the post-war period developed very slowly. Until 1929 it was checked by special taxation of foreign issues on the Paris exchange. The depression which developed in the autumn of that year and spread rapidly throughout the world, the critical condition of the public finances of most debtor nations and general uncertainty in foreign countries caused a decline in the supply of capital for export. In the field of long term investment only those foreign issues which for political reasons were regarded by the French government with special favor were successfully placed in the French market; for example, the Young loan of 1930, which effected the commercialization of a portion of German reparations. The outflow of French short term funds to foreign markets suffered a similar decline with the repatriation of a certain part of them after the stabilization of the franc and with the precautionary withdrawal of credits by French banks during the depression. The French have also substituted short term credits for a considerable proportion of the long term foreign investments of the pre-war period; these are placed for the most part in the English and American money markets.

The constitution of British foreign investments has not changed since the war so radically as that of the French. In the new capital issues on the London market domestic securities have

risen from 20 percent in 1908 to 65 percent in 1920-27; similarly, participation of British colonies increased at the expense of foreign countries. Although this may be taken as evidence of a trend toward imperial self-sufficiency in the investment of British capital accumulations, it was not produced by planned regulation or government intervention. The tendency to place more emphasis on bond issues, already apparent before the war, has continued to operate in favor of the dominions; and at the same time the investment in railway and mining securities has decreased substantially. Thus the proportion of bonds in the aggregate of British foreign investments has grown considerably and the connection between commercial expansion abroad and the export of British capital, which was originally very pronounced, has been further weakened. The geographical distribution of new capital exports has been strikingly changed since Germany has become a heavy borrower, and the importance of investments in the United States has radically declined. Thus in 1929 the British owned about \$1,560,000,000 in American securities as compared with \$3,300,000,000 in 1913. Under the leadership of the Bank of England the City played a decisive role in floating the stabilization and reconstruction loans of the continental European states, which have consequently suffered more than others from the decline in British long term investments since the depression of 1929. A comparatively new development has also been the absorption by the London money market of a large volume of foreign short term funds.

After the war the United States became one of the leading creditor nations of the world. American capital export rested in part on a surplus in the balance of international payments resulting not only from an excess of commodity exports over imports and the payments on account of interallied debts but also from an inflow of short term funds from abroad. The important factors, however, were the large stock of monetary gold, increased enormously during and after the war, and the huge expansion of credit based upon it. The volume of bank deposits was doubled, interest rates were kept low and there was a noticeable tendency to force capital export. Bond houses, which during the Liberty bond campaigns learned to reach even the small investor and accustomed the rank and file of the population to invest in securities, and investment banks, which before the war were engaged in importing capital from Europe, now made an easy adjust-

ment to the changed situation and undertook with the support of commercial banks and investment trusts the distribution of foreign securities in the home market. A large proportion of foreign issues, however, was not placed with the ultimate investors and remained in the portfolios of these institutions. It is thus that the American capital market, of purely national importance before the war, was transformed within a short time into an international money center; in experience and established tradition, however, Wall Street still lags behind the City in London.

The export of capital from the United States has proved particularly sensitive to market conditions, the amount exported exhibiting unusually large fluctuations from year to year. In 1924 and 1925 the net balance of capital movements represented an export surplus of \$500,000,000 to \$600,000,000; it fell to scarcely \$200,000,000 in 1926 and rose in 1928 to a record figure of over \$900,000,000 only to decline again in 1929 to less than \$400,000,000. In the years 1925 to 1928 a half of the long term credits went to Europe, but in 1929 the share of Europe fell to a quarter of the net export. On the other hand, the capital going to Canada represented only 14 percent of the total in 1925, but it increased to 42 percent in 1929. At the beginning of 1931 the foreign investments of the United States were distributed as follows: \$5,600,000,000 was in Europe, Germany alone being indebted to the extent of nearly \$1,500,000,000; \$4,000,000,000 in Canada; \$3,000,000,000 in Central America; and an equal amount in South America. Over a half of the capital placed in various American countries was represented by direct investments, while at least three fourths of the capital exported to Europe was represented by American investments in bonds. As a result of the rapid expansion of capital export from the United States the financial control of many Canadian enterprises was transferred within a few years from English to American hands and American enterprise was placed in a commanding position in certain South American states, such as Bolivia, as well as throughout Central America. Although this development began before the war, the assertion of the economic hegemony of the United States in the American tropics has proceeded successfully only in the last fifteen years. The most important branches of production in these countries, particularly plantations and mines, are entirely or in large part in the hands of American capitalists or entrepreneurs. Along with capitalistic penetration went the military and

diplomatic advancement of American interests, with the resulting subordination of a number of small countries on the Caribbean and the Pacific to the direct or indirect political control of the United States. Even so large a state as Mexico was involved in a mesh of diplomatic and military conflicts which developed out of the opposition between the interests of American controlled enterprises and the alleged or true interests of the debtor country. On the other hand, it has become an established practise if not a recognized doctrine of foreign policy on the part of the United States to protect by military force or at least by all available diplomatic means "endangered" investments in Central America, while similar intervention by European government is vigorously opposed on the basis of the Monroe Doctrine. The penetration of American capital into these regions has not only been protected by the United States government but in many cases definitely encouraged in advance. Investment opportunities, particularly in railroads, banks and the like, were brought by American officials to the attention of interested citizens, apparently with an assurance of government protection in case of need. The holders of bonds or stocks in Canadian and European enterprises were obviously without benefit of such protection; but the American government, following the example of France, reserved for itself the right of vetoing the public flotation of foreign issues, a right which had been exercised only in rare cases, such as the German potash loan or the loan of the Brazilian state of São Paulo. Promotion of capital export as well as benevolent neutrality toward it was part and parcel of the official policy of protectionism and was in accord with the promotion of commodity export. It was supported by the policy of the Federal Reserve Banks, which have several times, notably in 1924 and 1927, stimulated capital export by lowering interest rates.

Practically every modern country was for some time in the position of a debtor nation before it began to acquire a net export balance in its capital account. Although there have been cases in which emancipation from foreign indebtedness has been achieved by defaulting on such obligations (e.g. Portugal), the change in the status of a country from debtor to creditor is typically the result of an increase in capital accumulation from domestic sources and an intensification in the amortization of previously contracted obligations. In a certain sense such a development is inevitable with an increase

in the national wealth, which carries with it not only the possibility of establishing balances and investments abroad but also an interest in so doing which is similar to that of the capital importing countries. The development is connected with the promotion of foreign trade and the reduction of risks of capital investment through diversification. These stimuli to invest capital abroad become stronger with the expansion in production and the increase in the size of enterprises and plants. For technical and commercial reasons the optimum volume of output cannot be achieved if the producer is restricted to the markets of his own country; eventually he comes therefore to favor capital export since it would facilitate his penetration into foreign markets and assure for him the availability of foreign raw materials needed in continuously increasing quantities. The growth of English industry, for example, could not have proceeded at so rapid a rate without a continuous expansion of its sources of raw materials and of its markets. Similarly the post-war "industrial revolution" in the United States was connected with commodity export resting on the export of capital, although not so closely and not in the same way as in nineteenth century England. As soon as a country reaches a point at which its need for capital is not very acute, the export of capital abroad appears advantageous also to the private investor: foreign investments with the same risk yield as a rule a higher return than domestic securities and they offer at the same time important opportunities for diversifying risks.

The diversification of risks is also an important consideration from the point of view of the national economy as a whole. Other things being equal, investment abroad operates as a stabilizing factor in so far as it retards the development of booms and mitigates the effects of slumps in domestic markets. Against this must be set the losses in foreign investments. They were very considerable in the periods before 1890 and after 1914 but were comparatively small in the quarter century preceding the war. It is also important that interest rates in the creditor country are at a higher level than they would have been were no capital exported; consequently the distribution of the national income is altered in favor of the properties and entrepreneurial groups and income inequalities are accentuated. On the other hand, the export of capital insures better export markets for the sale of the nation's output and better terms on imports and effects in the long run an improvement

in the barter terms of trade with foreign countries.

Upon the attainment of a strong creditor position a country usually reinvests abroad a part or the whole of the interest on its foreign investments. This practise, which serves to strengthen the creditor position of the country, was followed by the Netherlands, Great Britain and France. For generations an income which generally increases more rapidly than the rest of the national income of the creditor country is thus obtained from the social product of foreign peoples. It is easy to conclude therefrom that creditor countries eventually develop into rentier nations, that their own production and enterprise languish while they live on the labor and produce of the soil of debtor countries. Actually this evolution into a rentier country is a purely statistical fact, which need not radially affect the social structure of the creditor country. Since the interest on foreign investments is in large part reinvested abroad and losses are suffered from time to time in foreign investments, the productive system of the creditor country and the volume of its output do not necessarily undergo any essential change; and no clear cut evolution is observable in the direction of a rentier economy based on investments abroad.

The regulation of capital export by political authority is not in the long run inspired by fears or hopes of this kind. In the mercantilist period capital export was retarded by restrictions upon the export of specie and upon the emigration of industrial enterprises and skilled craftsmen. During the following period of liberal economic policy there was complete freedom of capital export. In England as early as the first half of the nineteenth century even conservative governments refused repeated demands for intervention to impede the export of capital and actively to protect investments abroad. The fact that the house of Barings could float a Russian loan in London during the Crimean War is quite indicative of the spirit of the time. In the last third of the nineteenth century neomercantilist tendencies caused a revival of protectionism also in the capital markets. The export of capital was encouraged in order to stimulate commodity export or in order to facilitate the achievement of imperialistic aims and the establishment of secure economic and political positions in areas in which there was a rivalry between several national interests, such as colonial regions, China, Persia and so on. At the same time the reinvigorated tendency toward economic self-

sufficiency caused the appearance in Germany and France even before the war of strong movements for the prevention of capital export. The argument generally ran in terms of preserving the productive forces of the nation for the fatherland and of lending no aid to the industrial development of present or potential competitors. Although these pre-war movements remained more or less unsuccessful, the governments of the leading creditor countries on the continent displayed a tendency to intervene in order to regulate the direction of capital export. Such intervention was in the main discriminatory, directed against certain debtor countries rather than against capital export as such; its underlying purpose varied from the promotion of political alliances, colonial expansion schemes and the like to the protection of the investor against speculative excesses. In France such regulation was particularly effective since by the exclusion of foreign issues from the Paris exchange the minister of finance could practically eliminate unwanted foreign investments; there was in addition the direct influence exercised on the banks and the press. Similar methods were used to a much smaller extent in Germany. Whereas in France since 1900 virtually every large foreign issue involved government action, in Germany between 1870 and 1914 there were scarcely more than ten cases of governmental intervention of this type. The significance of such regulation should not be exaggerated; government action in this field is in the main of a negative sort, i.e. it amounts to a prohibition of certain issues which may frequently be evaded.

Apart from such undisguised and openly avowed regulation there exists in almost every creditor country a certain form of unofficial co-operation between the political administration of foreign policy and the banking leadership of the investment market; and no foreign loan of any importance is undertaken without sounding out the responsible diplomatic circles. In France and the United States such collaboration is encouraged by the government or the parliament, although in the latter country it is limited merely to warnings by the government, direct government interference in the capital market being virtually unknown. In pre-war Germany it had become established as a traditional practise without legal sanction, while in England it is effected through the channels of social intercourse in elusive contacts between government officials and bankers.

A third type of government action with re-

spect to foreign investments is as a rule closely linked to specific imperialistic policies. In international politics particular importance has attached to intervention by creditor nations in the interest of protecting the investments of their citizens in a foreign country. The legality of such interventions from the point of view of international law is questionable, and even the attitude of the great powers—the only countries resorting to such measures—is a vacillating one. Some acts of intervention are intended to open the door for investment by the country's nationals or to secure for them a monopolistic position; the China consortium, the Anglo-Russian conflict over the spheres of influence in Persia, the American policy in the Caribbean and similar examples illustrate active governmental promotion of private investments in disputed areas. Other types of intervention which have in the past led to grave international complication are those designed to protect supposedly endangered investments. Since the Palmerston circular of 1849 Great Britain has definitely felt entitled to utilize the full force of its power for the protection of the legitimate interests of its subjects in foreign countries. In practice the apparatus of diplomacy has been frequently used on behalf of British creditors, but the employment of armed forces or even the threat of such action has been very rare. The French, on the other hand, have repeatedly resorted to naval demonstrations and military occupation in the Ottoman Empire and Santo Domingo, as has the United States in Haiti and Nicaragua.

The import of capital involves serious political problems for the debtor countries as well. It is not true, as has recently been commonly believed, that the mere fact of being indebted to a foreign creditor leads or threatens to lead to political dependence. Debtor-creditor relations which cross political frontiers need in the nature of the case have no more political consequences than purely domestic relationships of this type. Even the indebtedness of a government to a foreign creditor is as such a purely private relationship. In fact, however, borrowing from foreign governments or from private creditors in a country whose government identifies itself with the capitalist interests of its citizens does involve the danger of political consequences. This danger is naturally greater for those politically weak countries which even apart from the need for capital import generally form the object of colonial exploitation, if their foreign indebtedness

is used as an opportunity for the creditor countries to intervene for purposes of "protection." Weak states run the risk of being subjected to a financial control which may mean anything from foreign financial advisers to a comprehensive system of concessions; from the mortgaging of certain revenue sources to the complete transfer of the financial administration to the representatives of the creditors, as in the case of the Dette Ottomane; from occasional military or naval demonstrations to complete annexation. Egypt, Algeria, Tunis, Turkey, Persia, China, Mexico, the Central American states, the Boer republics and other states have had to submit temporarily to such control because of their foreign indebtedness, and some of them still are in that status of submission to the great powers. The probability of the institution of such controls depends on the terms under which foreign indebtedness is contracted and the care taken to invest productively the proceeds of such loans.

The danger of financial and political control is not present or is present to a much smaller extent in the case of borrowing by a state in a strong political position. This holds true not only for great powers which still retain the status of debtor countries but also for lesser powers and smaller states, if by virtue of their geographic position or the rivalry of interested powers they are not suited to serve the purpose of political expansion. Such conditions, however, do not preclude a certain measure of foreign financial control in the event of complete default, particularly if new foreign loans are necessary before the debtor country achieves an economic recovery and settles with its old creditors. Thus even a strong debtor country which has been too reckless in borrowing and has fallen into difficulties may be in danger of having its sovereignty impaired through the instrumentality of financial control. Such difficulties may appear in a particularly striking form where foreign short term credits play a large part; the danger of a sudden withdrawal of such funds and of the resulting disruption of the banking mechanism operates so continuously and pervasively that it easily leads to the establishment of financial dependence upon foreign countries. Even without financial control the foreign policy of a nation with a foreign indebtedness or in need of foreign loans may be strongly influenced by the interests of the creditor countries. Thus certain political conditions, which did not necessarily coincide with the interests of the borrowing countries, were attached to the foreign loans of

Italy and Russia in the decades preceding the World War.

The economic incidence of capital imports on the debtor country is not limited to an expansion in production, an increase in wealth and a heightening of commodity imports and of labor immigration. Capital imports mean also a temporary improvement in the barter terms of trade in international transactions. Also of considerable importance is the fact that the debtor country must adapt its currency standard, at least temporarily, to that of its creditor. The widespread adoption of the gold standard has been and still continues to be largely the consequence of the demand for foreign capital; accordingly, when the international capital market is in a state of collapse the gold standard suffers a setback. Similarly the adoption of the financial and commercial traditions of the older countries by the business communities of backward regions and new countries goes hand in hand with the import of capital from abroad. Preservation of normal liquidity by the banks, the maintenance of a balanced budget and to a certain extent even the development of a modern system of courts and of other law enforcement agencies are often parts of the same process of adaptation of debtor to creditor.

The international movements of capital for short and long term investment constitute a most important factor in the development and integration of that system of economic relationships which is called the world economy. With respect to long periods of time this integration is achieved by an increasing uniformity in the direction and tempo of the capitalist development of all countries; for shorter periods it is expressed through an increased parallelism in the cyclical movement of business. International economic interdependence is especially marked at the turning points of the cycles. Thus in the nineteenth century periods of prosperity were for Great Britain also periods of intensified export of capital, while during depressions capital export declined. Consequently for the United States, South America and the non-European countries within the orbit of British influence prosperity in Great Britain was accompanied by enhanced capital imports and consequent speculative expansion; during depressions in England the volume of capital imports suddenly declined or vanished altogether, with the resulting reverses in business, depreciation of investments and intensification of social unrest to the point of revolution. Just as the United States and Aus-

tralia in 1873 and from 1890 to 1892, so the debtor countries in Europe in 1930-31 were forced by these shifts in capital movements to readjust their foreign trade balances and thus further to aggravate the depression.

Since the beginning of the nineteenth century the competitive struggle of important national groups of investment interests has often decisively influenced international economic and political relations. This struggle has gone hand in hand with the conflicts growing out of the colonial expansion of the great powers and with the commercial rivalries over important markets and sources of raw materials. Thus in the pre-war period vast amounts of foreign capital were poured into South America in connection with the financing of exports of industrialized countries. After the war the attempts to monopolize raw material supplies under foreign jurisdiction became more important: much diplomatic discussion has centered about the oil fields of Sumatra, Irak and Asia Minor, and important international settlements, involving the formation of combines for common exploitation by the interested powers, were arrived at. France, the United States, Japan and other countries have repeatedly sought to reserve colonial or other regions for the investment of their own capital and either to exclude directly or to obstruct by indirect methods the competition of other interests. Such methods of disregarding or dodging the open door policy have produced the Morocco problem and the grave conflicts involved in it; they have also played a large part in the struggle to open the West Indies and other backward regions to competitive foreign investment. International settlements between interested powers have in part eliminated threatening conflicts, but they have also erected new monopolies in the form of separate spheres of interest and the like. An effective method for the elimination of such dangers to international peace as well as for the economic and social progress of the weaker debtor countries seems to be offered by the mandate system of the League of Nations; this represents an essentially new development in so far as it involves, at least in principle, control by the League of the backward regions dominated by individual states. The further effective development of this system and above all the restoration or preservation of the principle of the open door—as Great Britain has consistently maintained it during the greater part of her recent history—might well offer the best guaranty of normal development of capital migration. The

elimination of political and certainly of imperialistic factors should also serve to limit poor investments, particularly in colonial regions, and to facilitate the restoration of a normally functioning system of international financial relationships. The latter should be made strong enough to withstand periods of depression, for its breakdown in such times has always led, and would in the future inevitably lead, to an aggravation of critical conditions.

FOREIGN LANGUAGE PRESS. The common type of foreign language press serves communities of immigrants settled permanently in a land where the vernacular is unfamiliar to the bulk of the immigrant group. Such a press may be found in any country receiving immigrants. It is most conspicuous in the United States, where in 1931 there were published 884 periodicals in 36 foreign languages with a total circulation of almost 8,000,000. Of these 165 were in German, 125 in Italian, 89 in Spanish, 82 in Polish, 75 in the Scandinavian tongues, 71 in Czech or Slovakian, 43 in Hungarian, 41 in French and 34 in Yiddish. Many papers of this type are also to be found in various Latin American countries; in 1931 there were more than a score in half a dozen countries, published in Italian, German, Chinese and Arabic. The presses of Chinese settlers in the Straits Settlements and Burma, Indian settlers in British Africa and Japanese settlers in Hawaii are in some respects similar in character. The papers of permanent, indigenous minorities like the French in Canada, the Germans in Czechoslovakia or the Jews in Poland have so different a status and face such different problems that they do not belong in the category of foreign language press.

The immigrant press performs simultaneously the opposing functions of promoting assimilation and maintaining separatism. It is the principal medium by which an immigrant group comes to understand its environment, and before the advent of the motion picture it was

probably the greatest single source of information concerning the new country. At the same time, the perpetuation of the inherited language and the publication of news of the home country and of the local immigrant group tend strongly to perpetuate a consciousness of difference. The very presence of the foreign language press makes it more or less unnecessary for the immigrant to subject himself to the assimilating influence of the native press. The degree to which any individual paper serves each of these ends depends less upon any consciously set editorial policy than upon the composition of the immigrant group it serves. The age of the group, the extent and regularity of an influx of new and a loss of old members, the attitude of the native element toward the immigrant and the action of other agencies for assimilation or separatism to which the group is subjected all unite to condition the function of such papers.

Foreign language papers vary in quality from the rudimentary sheets which are among the early evidences of an immigrant community's self-conscious life to papers which rank among the high grade journals of the country. In the early stages of a community a simple sheet providing news of the home country may be made up with the aid of scissors and paste from clippings from other papers. Such sheets, which are under slight pressure of competition, expend little money or skill for the purpose of delivering news promptly or presenting it attractively. The editor is usually engaged in some other occupation and carries on his editorial duties on the side. Such papers are commonly weekly publications, advertising only the merchants and professional men of the small community and having a local circulation and often a fairly short life. Their assimilative influence is slight; they serve primarily to preserve old associations and viewpoints among the immigrants and to mitigate their sense of strangeness in their new home. They tend to be politically partisan and to perpetuate in an alien environment differences which kept groups apart at home.

As soon as the characteristic mutual benefit societies have been formed, they begin to publish newspapers which depend for support upon membership subscriptions and furnish chiefly organization news. Some organizations, such as the German Workmen's Sick and Death Benefit Fund of the United States, publish sheets of high literary merit. If there is a controversy within the organization the post of editor is coveted. Where there is active leadership the organ

furnishes guidance in meeting the new environment, carrying articles on such subjects as the legal status of aliens, the ideals of the new country or problems of child rearing. Later such papers add juvenile sections in the local language and become partially, sometimes wholly, transformed from one language to the other.

In well established communities papers of a more pretentious sort appear. Foreign language dailies in American cities where large immigrant groups are located resemble essentially the ordinary commercial press of the city. Italians in New York secure their general news through *Il progresso italo-americano* and the *Corriere d'America*, while many Jews with sufficient command of English to read the American press prefer the *Day*, the *Jewish Morning Journal* or the *Forward*. Whereas these papers bear some resemblance to the simpler type of immigrant paper in giving great prominence to Italian or Jewish news and to the gossip of their respective communities, the principal matter, especially in the Jewish group, is general news so presented as to interest the foreign language readers. This type of paper in offering to the immigrant the news of his new environment in his own language and with the emphasis which he understands works directly and effectively toward assimilation. Its separatist influence is incidental and operates through preserving group consciousness rather than old world stereotypes and differences.

Between these two extremes are many papers which serve both to sustain old interests and to interpret new or which are in transition from one extreme to the other. The transition involves an important shift in their reading public and in their type of journalism. The rudimentary sheet, addressed to the literate few, presents its news with an admixture of opinion and considerable editorial comment. The commercial papers, however, cannot develop mass appeal through the expression of opinion; they must rely on news and so tend to develop an enlarged news service—to copy, in fact, the American commercial press with its mass circulation. They adopt a similar format with headlines and introduce such popular features as comic strips.

Mortality among the foreign language papers is high, and their near or complete extinction inevitable, because of a gradual loss of subscribers as the local language becomes the language of the immigrant group and as the new generation grows up with little interest in the news and affairs of the ancestral country. Foreign language papers inevitably face the problem whether or

not to introduce sections in English in an effort to hold their subscribers; if they decide to do so, they thereby risk the loss of advertisers who prefer to reach the English reading public through the English press and of subscribers whose knowledge of English they themselves improve. Only rarely does a paper become bilingual, like the weekly *Greek Star* in Chicago. Some of the early German language papers in the middle west gradually transformed themselves into English language papers. This response has been rare, however, with the exception of the Spanish papers along the Mexican border, where the community is permanently bilingual. Most editors rely on language necessity to hold their readers rather than on their prestige or the superior character of their journalism, and they fail when their public abandons the old language. In fact, the more a foreign language paper seeks, by introducing features characteristic of the local press, to hold its readers who are becoming assimilated, the more it hastens its loss of support by furthering the process of assimilation. As a foreign language paper comes to resemble a typical native language paper its reason for existence disappears. On the other hand, if the paper retains its conservative character and fails to fit the local mold, it cannot hold a public whose tastes are being shaped by forces outside its control. The life cycle of the foreign language commercial press thus ends in suicide or obsolescence.

But even where a steady influx of immigrants constantly renews the foreign language reading public the mortality of foreign language papers is high, partly because of the crude character of early sheets and their highly controversial nature and partly because of the loss of potential readers which occurs simultaneously with the influx of new ones. Only a few papers, for example, the *New-Yorker Staats-Zeitung*, which has served the German public since 1834, have had careers comparable in length with those of the best of the native press.

Still another type of publication is that which represents a cause, usually religious or political. In the United States there are many foreign language religious periodicals, especially among the Scandinavians and Germans, and some radical political sheets. Such papers are supported by national or international organizations, and retain their language differences only as long as these are indispensable to them in reaching their various audiences. If the religious or political group represents an alien point of view, its organ

may be separatist in influence even when the language difference has been lost. On the other hand, proselytizing sheets issued in foreign languages by local religious bodies are definitely assimilative from the start. With the exception of a few groups the propaganda press reaches only a small proportion of the foreign language readers in the United States; all the major groups are served predominantly by the commercial type.

Except for a few large urban dailies foreign language papers are essentially provincial, reflecting the social isolation which makes an ethnic group resemble a geographically isolated community; they also frequently reflect the ideology of an earlier date, since isolation perpetuates the stereotypes of the time of emigration, identifies them with the national character of the old environment and further widens the gulf between the surrounding culture and that of the immigrant group.

The immigrant press is subject to pressure from its home government through diplomatic and consular authority and even through direct subsidy. Such pressure assumes important proportions when the home government seeks to maintain control of its nationals abroad, as is the policy of the Fascist government working through the Italian press in the United States. It is also subject to both pressure and exploitation by representatives of the country in which it is located and by advertisers seeking to take advantage of the ignorance of its readers. Prior to the World War no direct effort was made by the American government to control the foreign language press, but considerable political influence was exercised by party representatives through the placing of political advertisements and control of editorial policy. The greater ability of foreign language editors to deliver votes, their usual need of funds and their lack of fixed political principles make them particularly susceptible to political pressure. During the World War the efforts of the propaganda department of the government to control public opinion brought the foreign language press for the first time under direct governmental supervision. Although only a small proportion of the press was engaged in radical or enemy propaganda, all of it was suspected of such activity; the power to deny the privilege of the mails was evoked and the content of the papers closely scrutinized. The tendency became one not simply of eliminating all enemy and all alien influences but in addition of making the foreign language press

an even more pliable medium for government propaganda than the native language press. At the close of the war renewed interest in problems of assimilation and the realization of the power of the foreign language press toward that end developed into an effort to stimulate the favorable features rather than to suppress the unfavorable features of these papers. Since 1918 the Foreign Language Information Service has furnished editorial, feature and news releases to newspapers in seventeen foreign languages, thus aiding them in linking the old culture and interests with the new.

Another type of foreign language press is that which serves a community of émigrés. Such communities are made up of political exiles, business men, imperialist agents in backward countries or tourists seeking diversion or education. Such papers as the *Novy mir*, published in New York before the war by radical Russian émigrés, or the *Posledniya novosti* of Paris, published today by reactionary émigrés from Russia, serve political exiles. Of commercial émigré papers several score published in English, Japanese and French are to be found in the important Chinese commercial centers; half a dozen in Japan; several in India, Egypt, Siam and the Balkans; a few in Latin America; and one, the *Moscow News*, in Russia. This type of paper tends to merge in colonial countries with the type serving the needs of the community of alien imperialist administrators, who are generally of the same national origin as the large body of commercial émigrés. Papers serving such mixed commercial and official communities are found in Burma, Ceylon, India, Palestine, Straits Settlements, Syria, Indo-China, Hawaii, the Philippines, Porto Rico and Panama. In the more backward of these countries they constitute by far the most important section of the entire national press. The tourist paper is typified by the New York *Herald* and the *Continental Daily Mail* of Paris; the English language press of Mexico City and Havana, basically the press of a commercial émigré community, today shares characteristics of the tourist press as well.

The common characteristic of these papers which sets them off from the emigrant press is their attachment to the land of origin of their readers. All represent communities which regard themselves as but temporarily exiled and which on all points of issue take their lead from the home country rather than from the country of residence. Indeed, such communities and hence their press generally show little interest

in the condition of their country of residence as such. All such papers function as definite obstacles to assimilation. The extent of toleration shown such papers by the local population and its government varies. The imperialist press in colonial countries enjoys greater liberty than the native language press. In backward regions foreign language papers, despite their practice of pushing imperialist and even annexationist policies and their not infrequent subsidization by a foreign government, meet no serious difficulty until a growing native nationalism seeks to defend home interests against imperialist invasion. The fate of the political émigré press depends entirely on the relation of its particular political doctrine to the dominant view of the country of publication. The pre-war Russian radical press enjoyed comparative freedom in Switzerland and the United States, where international politics played a small role in the national life, and little liberty in France, where Russian diplomatic pressure was brought to bear on the local police; today the reactionary Russian press enjoys universal freedom.

The political émigré press contains in addition to news of the home country chiefly ideological discussions. Hence it has always more than a local circulation and is disseminated wherever émigrés may be scattered and often smuggled into the home country. The tourist press often avoids taking any definite or outspoken editorial position and thus escapes any difficulties in its relations with the local government. When it does take a position, either as a result of pressure from the home country or from a commercial émigré community in the country of publication, it sometimes incurs local unpopularity; but since it usually has powerful backing it rarely encounters serious difficulties.

FOREIGN TRADE. See INTERNATIONAL TRADE.

FOREL, AUGUSTE HENRI (1848-1931), Swiss neurologist and entomologist. Graduated in medicine at Zurich and Vienna, Forel became in 1879 director of the mental hospital and professor of psychiatry at Zurich. From these appointments he retired in comparative poverty in 1898. His prolific and diversified scientific activity began when as a child of seven he first studied ants under the inspiration of his uncle, the naturalist Alexis Forel. His publications in this field, brought together in final form as *Mensch und Ameise* (Vienna 1922; tr. by C. K. Ogden as *The Social World of Ants Compared with That of Man*, New York 1929), have all the charm of Fabre's writings on ant life and are

more scientific and philosophical. As a neurologist his authority was internationally recognized. He put forward simultaneously with His, but independently, the theory of the neuron structure of the nervous system (*Gehirn und Seele*, Bonn 1894, 13th ed. Leipzig 1922) and contributed to establishing the medical use of hypnotism in *Der Hypnotismus* (Stuttgart 1889, 12th ed. 1923; tr. from 5th ed. by H. Armit, London 1906). Forel founded and edited the *Journal für Psychologie und Neurologie*.

Throughout his varied scientific work Forel had in view the philosophical and social implications of science. He was a foe to pedantry and addressed himself to a wider public than that of the specialist. His chief aim as a psychiatrist was to found a science of racial and social hygiene. He stressed perhaps too exclusively the factor of heredity and was an ardent eugenicist. He regarded degenerative effects in the germ cells as one of the chief causes of racial decay and vigorously combated the use of narcotics and alcohol in *Hygiene der Nerven und des Geistes im gesunden und kranken Zustande* (Stuttgart 1903, 7th ed. 1922). His widely translated book on sexual questions, *Die sexuelle Frage* (Munich 1907, 15th ed. 1923; rev. adaptation by C. F. Marshall, New York 1922), was a pioneer book on sex hygiene. In his later life Forel's interest in socialism overshadowed all others and pervaded his scientific work. During the World War and after he displayed great moral courage in his untiring efforts in the cause of pacifism, which he defended in *Les états-unis de la terre* (Lausanne 1914) and *Assez détruit, rebâtissons* (Lausanne 1916).

ROBERT BRIFFAULT

Consult: *Bibliographia foreliana* (Vienna 1908); Volkart, Otto, *August Forel, eine Skizze zu seinem 70. Geburtstage* (Olten 1918); Bertholet, Édouard, *Auguste Forel* (Lausanne 1918).

FORESTS have played an important part in the history of civilization. They have affected the distribution of mankind over the earth's surface and have influenced the religious life of primitive peoples. Throughout history wood has been one of the most important essentials in the economic development of the human race. The forms in which wood has been used have undergone many changes. The Indians used the bark of trees to make tepees; the settler used the logs to build his cabin. Logs sawed into lumber are now used in the construction of houses, furniture and other commodities of

everyday life. There has been a growing tendency to convert wood into pulp, out of which boards, insulators, artificial silk and leather, ropes, interior woodwork and a thousand other commodities are fabricated. The recent development of the use of wood in the manufacture of news print and book paper has been phenomenal. Fifty years ago cotton and linen rags were the chief sources of paper; now between 80 and 90 percent of the world's paper is made from wood fiber. In the United States alone over 7,000,000 cords of pulpwood are used annually to make pulp and paper. The advances made in the chemistry of cellulose open an extensive field for the use of wood fiber. Liquid fuel (ethyl alcohol) may in the future be derived from wood. Chemists claim that the coming age is the age of cellulose, in which wood and consequently forests must play an important role.

In spite of many substitutes such as steel and concrete wood is one of the few commodities that has shown a steady growth in both volume and value during the last century. In Great Britain the per capita consumption is now almost four times as great as it was in 1851. Even in France with her practically stationary population timber consumption is slowly increasing; that of Germany more than doubled within a century; in the United States at least seven times as much lumber is used now in a year as in 1850, and even the per capita rate of consumption is considerably larger. Judging from the rates of increase in these and other important consuming countries, the world's timber needs may be expected to double within approximately fifty years.

The world's total production of wood (including firewood) is in the neighborhood of 56,000,000,000 cubic feet; of this 26,000,000,000 cubic feet are saw log timber convertible into lumber. Nearly one half of all the saw log timber and two fifths, or about 22,000,000,000 cubic feet, of the world's total wood production are consumed in the United States. The per capita consumption of wood in this country is 228 cubic feet, or about eight times the rate of consumption in western Europe. The total value of forest products in the United States alone is estimated to be about \$3,500,000,000 a year. This does not include the value of forest by-products, such as naval stores, furs, tannin, berries and nuts.

Perhaps the most important of the indirect services of the forest is that connected with stream flow. Forests equalize the run off of

water during the alternate seasons of heavy precipitation and drought. In most of the countries of Europe this recognized influence of the forests has resulted in the enactment of special laws with regard to timber cutting on watersheds, whether publicly or privately owned. Such forests are designated as protection forests. The value of the forest as a place for recreation and aesthetic enjoyment is also becoming increasingly more important.

Forests belong in the category of renewable natural resources. Unlike the mines, which once exhausted are gone forever, forests can be renewed and used indefinitely. In common, however, with other natural resources of the earth, as long as their exploitation was left unrestricted in private hands, forests in almost all ages and in all countries have been squandered by men with a wanton disregard for the future.

The present forest area of the world in round figures is about 7,500,000,000 acres, which is 22 percent of the land area exclusive of the polar regions. The area of actually productive forest, however, is probably only 5,500,000,000 acres, which is 16 percent of the land area and 3.2 acres per capita. Forests occupied a much larger proportion of the earth's surface in former times. As a result of land clearing and forest fires that followed in the wake of forest exploitation, much of the original forest has disappeared. With the possible exception of China the greatest change has taken place in Europe, where of a total land area of nearly 2,500,000,000 acres only one third, or 774,000,000 acres, remains in forest. Almost two thirds of this, or about 500,000,000 acres, are in European Russia and Finland and only 275,000,000 acres in the rest of Europe. In Great Britain 95 percent of the original forest is gone. In France, Spain, Belgium, Italy and Greece from 80 to 90 percent of the original forest has been destroyed; Sweden and Finland are the only countries with half of their forests left. Large areas of forest have been cleared in the more populous regions of South America and Africa, and even in the less developed regions the same process is going on slowly but steadily.

The original forests of the United States are estimated to have covered 822,000,000 acres and to have contained 5,200,000,000,000 board feet of timber. Over two thirds of this area have been culled, cut over or burned; three fifths of the original timber are gone. There are left about 138,000,000 acres of virgin timber, 114,000,000 acres of culled and second growth

timber large enough for sawing, 136,000,000 acres partially stocked with smaller growth and 81,000,000 acres of devastated and practically waste land. These 470,000,000 acres of forest land contain about 2,215,000,000,000 feet of timber of merchantable sizes. The federal government owns approximately 89,000,000 acres and the states, counties and municipalities own 11,000,000 acres, totaling 100,000,000 acres, or 21 percent, held in public ownership. The remaining 370,000,000 acres, or 79 percent, are held in private ownership.

Of the 89,000,000 acres of timbered land owned by the federal government about 81,000,000 acres are included within national forests definitely dedicated to timber growing. The aggregate area of national forests is about 139,000,000 acres but this includes large areas of grazing and brush land which are not timbered. The remaining 8,000,000 acres are in national parks, national monuments, Indian and military reservations and unappropriated public domain. In addition there are some 21,000,000 acres of national forests in Alaska. The national forests represent the most stable forest ownership in the country and that most favorable to the continuous production of timber crops. Of the 370,000,000 acres in private ownership approximately 127,000,000 acres are farm wood lots and the remaining 243,000,000 acres represent the holdings of land and lumber companies, mining companies, railroads, and other owners who have in the vast majority of cases no permanent interests in the land except for the merchantable standing timber on it.

One half of the privately owned commercial timberlands in the United States is held by approximately 250 large owners; the ownership of the remaining timber is very widely distributed. While there are still a large number of individual owners of timber and sawmills operating as separate units, the larger interests are acquiring a more dominant place in lumber manufacture, especially in the west. Although monopolistic conditions on any general scale do not as yet exist in the lumber industry, the degree of control of the remaining timber by a comparatively small number of large interests must steadily increase as timber depletion continues and may soon approach a monopoly, especially in the case of the diminishing supply of high grade material.

Reforestation of the cut over land and management of the forests in private ownership in the United States is making very slow prog-

ress. A recent estimate by a special committee of the Society of American Foresters put the acreage of private commercial timberland under some form of conscious forest management at about 12,000,000 acres, or 5 percent of the 243,000,000 acres of privately owned timberland (exclusive of wood lots). Many foresters contend that actually 1 percent of the private forest lands, or less than 2,500,000 acres, is handled on a continuous production basis. The reluctance of private capital in the United States to go into timber growing, especially of trees of the large saw log size, must be explained by historic, political and economic factors. The time element together with the large capital required in the growing of saw log timber and the necessity for a continuous plan of management renders the forestry business practical only to states, corporations and trust companies.

In Europe large private forests originated with the landed aristocracy. These forests were often entailed and were kept for generations in the same family. They were a part of the estate and served not only as a source of raw materials but also as hunting preserves. Other private forests in Europe owe their origin to some industry dependent upon wood, particularly the pulp and paper industry. With the settled conditions in the older European countries, with fire danger practically eliminated and the continuous interest of the owners in the land itself supplemented by special laws prohibiting timber cutting that would lead to forest destruction, private forests in Europe have escaped to a large extent forest devastation and proved a sound although conservative investment for their owners. Nevertheless, in spite of all these favorable conditions for private ownership of forests the experience of the older countries has clearly shown that private interest alone is insufficient to secure proper regard for the protective value of the forest cover and for the needs of the future.

During the nineteenth century there was a growing tendency to bring under public ownership forest lands whose preservation could not be safely entrusted to private interest. Norway, France, Germany, Belgium and Italy within the last seventy-five years have greatly increased the area of publicly owned forests, and even the United States has recently undertaken a similar policy in the purchase of forest lands by the federal government and by individual states. About two thirds of all the forests of

the world are owned by the public and one third is in the hands of private corporations and individuals. In France proper 34.5 percent of the forests are publicly owned; in the French provinces Alsace and Lorraine over 80 percent of the forests are public. In Germany close to 52.7 percent of the forests are publicly owned; in Italy 49.7 percent; in Belgium 38 percent; in Denmark 52.9 percent; in the Soviet Union all the land including the forests is national property. Canada has retained most of her timberland and can adopt conservative methods of handling it without being hampered by conflicts with private property rights.

With all the awakened interest in the importance of forests only 10 or 15 percent of the world's timberland is being handled as a renewable, continuously productive resource; while 15 or 20 percent additional is more or less protected from destruction but still regarded as a timber mine; and the greater part, from 65 to 75 percent, receives no care whatever. Forests managed with a view to conservation are very largely either publicly owned forests or private forests under strict public regulation. Since it is now generally recognized in Europe that uncontrolled private initiative is totally unable to cope with the forest problem, some form of government regulation or ownership is absolutely essential.

In the United States most of the private timberlands were formerly public domain which was parceled out as land grants to the states, the railroads and under various public land laws, such as the Homestead Act, the Timber and Stone Act, to corporations and individuals. The states also allowed most of their domain to pass into private hands. The interest of the owner was in the timber and not in the land. The timber was mined just as an ore, and after it had been removed the interest of the owner in the land itself ceased except for the possibility of selling it to settlers. The country was new; population increased rapidly; and most of the cut over land was supposed to be diverted into agricultural use. The timber resources seemed inexhaustible, and the lumbermen after they cut over one region moved to another. The use of the forest as a continuous, reproducible resource never entered the pioneering psychology of the lumberman, and much the same psychology still prevails among the old generation of lumbermen, who are interested only in immediate profits.

There are several distinct economic and psy-

chological obstacles to private forest practise in the United States. The length of time which must elapse before any expenditure for timber growing bears fruit, especially if one starts with bare land, is great. Forest practise when it begins with an existing forest is a comparatively simple problem. With conservative methods of cutting, such as the removal only of the largest and ripest trees while leaving the younger thrifty trees to obtain their full size, the forest may be perpetuated merely at the cost of protecting it from fire. For the most part, however, private forests have been cut of all merchantable timber, especially within recent times, and as a general rule the cut over land has been repeatedly burned. Nature left to itself may eventually restock the forest, but nature takes its own time and often chooses for its working material kinds of trees which are not always those economically most useful to man. On most of the cut over private lands artificial planting, which is an expensive measure, must be undertaken. Even when nature alone restocks the cut over land with desirable trees, a long time must elapse before a timber crop is matured—in the case of saw log timber from fifty to one hundred years. The average investor refuses to spend money which cannot bring returns for at least two generations. The practise of forestry also involves great risks. With twenty to forty million acres of forests burned annually, with insect depredations over large areas and with many plant diseases rampant the investor's prospects for realizing on future timber values are not promising.

The heavy taxes levied upon forest land and standing timber are likewise an obstacle to reforestation. Although forest land yields no dividends for many years it is taxed annually by state, county and township, and with the growing rates of taxation on all real property the private timber owner in self-defense is often forced to liquidate his standing timber as rapidly as possible and to abandon his cut over land for non-payment of taxes. Overproduction of lumber in the face of a diminishing supply of standing timber is another deterrent. Because of the highly competitive organization of the lumber industry the efforts of the national and regional trade associations to control production have had meager success. The result is overproduction of lumber, on the one hand, and forest destruction without any provisions for renewal, on the other. To these drawbacks must be added the uncertainty of future markets and

the low returns from timber growing, while higher returns may be obtained from equally safe, if not safer, investments elsewhere.

In order to encourage private forestry the federal government has adopted a policy of cooperation expressed in the Clarke-McNary and the McNary-Woodruff acts. Under these laws the government has attempted to provide better fire protection, devise a new basis for forest taxation, conduct research in better utilization of forest products, timber growing and control of insect pests and diseases, find new uses for inferior species and new markets for lumber, offer technical advice and demonstrate through the establishment of national forests better methods of handling forest lands. Many states have followed the example of the federal government and have adopted similar policies. In some of them new forest tax laws have been enacted and planting stock is being distributed either at cost or entirely free to any prospective planter of forest land.

The group of private owners which shows the greatest interest in the practise of forestry is the pulp and paper industry. A sawmill is easily depreciated within a few years and the timber operators move to another region. A pulp and paper plant, on the other hand, is a costly investment which involves abundant water supply and water power, and it must be assured of a definite perpetual supply of raw material. Moreover, the timber for the production of pulp can be grown in thirty to forty years, which is not too long a period in the life of a large corporation. Similarly other industries dependent upon wood, such as mining and fruit growing, are likely to become interested in reforestation and forest practise. In spite of all the federal and state encouragement and the interest of the pulp and paper industry private owners have voluntarily placed only from 1 to 5 percent of their forest lands under forest management of any sort.

According to estimates of the United States Forest Service four times as much wood is removed from the forest or destroyed annually as is returned by new growth, and in spite of all conservation measures and talk the rate of destruction is still increasing. It is estimated that the visible supply of accessible timber in the United States at the present rate of cutting will last thirty-five or forty years. The only forests that are being managed on a continuous production basis are the national forests. When the privately owned timber is exhausted, the

national forests will have to stand the brunt of supplying most of the country's needs, especially in high grade saw log material. The actual timber bearing portion of the national forests is not as large as the aggregate area of national forests would indicate; and much of this timbered land is at high altitudes, inaccessible, difficult to log and of slow growth. The timbered area within the national forests by itself through the growth of timber alone will not be sufficient to meet the needs of the country.

The destruction of the privately owned forests besides depleting a natural resource essential to the welfare of the people is creating new economic and social problems. The privately owned forests after they are cut over and, as a general rule, repeatedly burned are abandoned by the millions of acres by their owners and are drifting back into public ownership, into the ownership of the states and counties. In a certain sense a new public domain is thus being created. This new public domain, however, is not the rich domain that passed out of the hands of the federal government. It is land stripped of its valuable timber, ravished by forest fires, land that nobody wants and land that needs to be brought back into productivity at a considerable outlay of money and without tangible returns for a long time. The states, with the exception of a few richer states like New York, Pennsylvania and Michigan, are financially unable to cope with this problem of abandoned cut over land. This is especially true of the counties, which in the cut over regions are for the most part in financial straits and have barely enough funds to carry on the business of the local government, to say nothing of an extensive program for the rehabilitation of cut over land. Nevertheless, the only possibility of economic redemption of the millions of acres of tax delinquent, abandoned and reverted lands lies in their reforestation and in their development for recreational purposes. The movement for creating state forests, county forests, game refuges and state and country parks is gaining momentum in practically all northeastern states, largely both as a means of meeting the needs of a constantly increasing number of tourists and also as an outlet for the use of land which is crowding upon the states and counties. With a few notable exceptions most of the state and county forests are forests on paper only, with no technical supervision and no funds for their proper management. The states, however, will eventually be

obliged to undertake a comprehensive program of reforestation and recreational development of their newly acquired public domain. It may involve readjustment in the local units of government, the evolution of new methods of agricultural settlement, discovery of sources of taxation other than real property and the redistribution of the whole burden of taxation before a proper solution to the cut over problem is found. The economic process of the abandonment of cut over land by the private owners is merely a further proof of the folly of allowing unrestricted exploitation of natural resources, particularly such as forests, which aside from being an economic resource affect the climate, the stream flow, the recreation and health of the people.

The soundness of the laissez faire policy with regard to the timber still remaining in private ownership is now being seriously questioned, but whether it should be replaced by public acquisition of all private timberlands or by regulation of cutting on privately owned land is still in the realm of discussion in the United States. There is, however, a unanimity of opinion in Congress, state legislatures and now even on the part of the lumber industry as to the need of bringing the bulk of the cut over and devastated forest land under public ownership.

FORSTER, WILLIAM EDWARD (1818-86), English statesman. Forster attended Quaker schools until his eighteenth year. In 1841 he made permanent business connections in Bradford, where he won a fortune as a woolen manufacturer. Early interested in philanthropic and liberal enterprises, he became active in politics soon after going to Yorkshire and represented Bradford in the House as a Liberal from 1861 until his death. He was acquainted with such radicals as Robert Owen and Thomas Cooper, the Chartist, and was active in Bradford in directing the Chartist movement, with which he expressed moderate sympathies, into non-revolutionary channels. He played a role in the movement for extension of suffrage and advocated abolition of slavery and protection of backward peoples against exploitation. As chief secretary for Ireland and under Gladstone from 1880 to 1882 he advocated the suspension of habeas corpus in order to break the Parnell party and was responsible for the notorious Coercion Bill of 1881. He was chairman of the Imperial Federation League. His chief importance was in his work for the improvement of popular education. He sat on the Schools Inquiry Commission from 1864 to 1867 and was minister of education from 1868 to 1874 under Gladstone. In 1870 he introduced and brought to passage the Elementary Education Act, which broke the old deadlock formed by the radicals, who favored publicly supported schools free to all, with compulsory attendance and a secularized curriculum; by the church party, which desired publicly supported schools with instruction in the tenets and ritual of the Established Church; and by the Dissenters, who opposed both secularization and the dominance of the state religion. Forster himself took a position much like that of the Dissenters, thus alienating radical sympathies. The act provided for national grants in aid to existing voluntary agencies and for the creation of elective district school boards to fill gaps in the educational system by supplying elementary schools where voluntary effort was inadequate. These were to be supported by local taxation and national grants in aid. In the board schools no denominational catechism or religious formulary was to be taught, although the Bible was to remain. School boards were empowered to compel attendance of children up to the age of thirteen. Despite its

compromise character and inherent contradictions of principles this act began in England a movement toward an efficient and comprehensive system of public education. Forster represented the extreme right wing of the Liberal movement and was unsuccessfully proposed by such elements to succeed Gladstone as party leader.

FORTESCUE, SIR JOHN (c. 1394-1476), English jurist and political theorist. Fortescue became chief justice of the King's Bench in 1442 and sat until 1460, when he espoused the Lancastrian cause. He remained in exile in Scotland, Flanders and France from 1461 to 1471. After the Lancastrian party collapsed in 1471 he was reconciled with Edward IV and spent the last few years of his life in England. His arguments and decisions, one or two of which are of some constitutional interest, are reported in the *Year Books* and the decisions have been translated by Lord Clermont.

Fortescue's leading academic work, a lengthy treatise entitled *De natura legis naturae*, was written between 1461 and 1463 (ed. by Lord Clermont, 2 vols., London 1864). It is a theoretical study, occasionally tempered with observation upon the law and politics of the period. His thought is characterized by its insistence that the law of nature is purely mundane as contrasted with divine law. Having established this conception, he uses the law of nature as the basis of an argument for the Lancastrian dynastic claim.

His life abroad stimulated Fortescue to undertake the comparative study of English and French law, both public and private. From 1468 to 1470 he wrote *De laudibus legum Angliae* (1537; tr. by R. Mulcaster, London 1567), in which the English jury trial, limited monarchy, legal profession and legal education are extolled in comparison with French law and institutions. He perceived, however, the connection between law and economic and social conditions and admitted that different countries might require different types of law. Written to instruct the young Prince Edward in the rudiments of law and government, the elementary character of the book makes it especially valuable for its descriptions of jury trial and of the legal profession.

It also contains an interesting analysis of the origins and nature of absolute and limited monarchies, an analysis already begun in *De natura legis naturae*.

De monarchia or *The Governance of England* (ed. by J. Fortescue-Aland, London 1714, 2nd ed. 1719; new ed. by C. Plummer, Oxford 1885), written about 1471, is a searching criticism of the "Lancastrian experiment" in constitutional government and the causes of its failure. The remedies which Fortescue suggested, in spite of an element of fantasy, really presaged the policy of the Tudors in advocating government by permanent councilors of humble birth instead of by great lords and prelates.

Fortescue was the first English lawyer to write for the lay reader and one of the first to embark upon comparative law and politics; nor is it an exaggeration to say that he really sought for "the spirit of the laws" of England and France.

FORTUNATOV, ALEKSEY FIODOROVICH (1856-1925), Russian agronomist and statistician. Fortunatov studied medicine at the University of Moscow and agriculture at the Petrovski Academy of Agriculture and Forestry. He then lectured on agriculture and statistics in agricultural colleges in various parts of Russia and in 1904 joined the faculty of the Moscow Agricultural Institute (formerly the Petrovski Academy) as professor of agricultural statistics. While in Moscow Fortunatov also taught at several other educational institutions and gave short term courses for agronomists offered by the zemstvos, the autonomous provincial bodies.

Fortunatov brought to his work an amazing erudition and remarkable ability. His monograph *Urozhai rzhi v Evropeyskoy Rossii* (Rye

crops in European Russia) (Moscow 1893) immediately won a permanent place in Russian statistical literature. But Fortunatov's chief importance rests on his activities as a teacher. He trained a generation of agronomist statisticians. His teaching methods were largely the outgrowth of his training in the natural sciences and differed widely from the teaching practises then followed in the social sciences; he had little use for the lecture or even the seminar method of instruction. He believed that the student of the social sciences should acquire an attitude toward his subject very similar to the attitude of the student of the natural sciences; that is, he should test the knowledge acquired in the

classroom and the textbook by direct observation of the material and in independent study of sources. The numerous students attracted to him, their many published studies and his influence on their subsequent work and thus on the organization of agricultural statistics all testify to Fortunatov's achievements as a teacher.

FORTUNES, PRIVATE

ANTIQUITY.....CLEMENS BAUER

MEDIAEVAL AND EARLY MODERN PERIOD.....JAKOB STRIEDER

MODERN PERIOD.....LEWIS COREY

ANTIQUITY. Fortunes are accumulations of wealth or property which constitute a private legal claim upon production and income. The size and form of private fortunes vary in different historical periods. The great fortunes of one period may be the commonplace accumulations of another; land as the primary source of fortunes yields to trade and industry, war and pillage to speculation. Variations may exist simultaneously, but in any given period a dominant norm tends to develop. All these variations, including frequency, are conditioned by prevailing economic and political relationships in which unequal distribution of wealth and income is a persistent and fundamental characteristic.

In pre-Hellenic Greece there were at first few opportunities for the accumulation of wealth and the piling up of large private fortunes. Differentiation developed in the size of landholdings, however, and after the Peloponnesian War the tendency to acquire relatively large holdings appears to have become stronger and to have been accompanied by speculative buying and reselling. It is also probable that the farming of tax collection and state mines proved to be the source of considerable profits. Nevertheless, the first real opportunity for acquiring large fortunes outside of landownership appeared only with the integration of a vast economic area and with the opening of the East by Alexander the Great and the Hellenic dynasties. To be sure, the new opportunities for fortune building remained narrowly restricted. The situation is exemplified by the economic organization of Egypt under the

Ptolemies: the greater part of the land belonged to the monarch or to the state and the state monopolized also the essential branches of industry as well as large scale trade and finance. Such restrictions and monopolies existed in nearly all the Hellenic states, although some of them left more room to private initiative in commerce and finance. The opportunity to acquire fortunes afforded by this system was open at first only to high officials and later to the farmers of the state taxes and monopolies. A representative fortune of this kind is that of Apollonius, a royal minister of the Ptolemaic period and the owner of vast tracts of land in Fayam; his fortune was founded on royal gifts and multiplied by quite rational modern methods.

Very great fortunes existed in Hellenic Asia Minor during the first century B.C., although in many cases it is impossible to trace their origin. For example, Hero of Laodicea possessed a fortune of over 2000 talents and Pythodorus of Tralles, a friend of Pompey, one of 4000 talents. That the opportunities for profitable money transactions constantly increased in the trade of late Hellenic times is indicated by the steady influx of Italians—most of them apparently Greeks from southern Italy—into the most important trading fields of the eastern Mediterranean. Their main activity was banking, particularly exchange and loans—private loans in the form of advances on cargo and public loans in anticipation of tax collections. Many of these financiers acquired large fortunes; Cicero's friend Marius Curius is an example. Trade intermingled with

war and piracy; Carthaginian merchants and politicians used efficiently the characteristic combination of commerce and conquest and grew rich from the spoils and labor of subject peoples.

The Roman civilization produced no fundamentally new form of wealth accumulation or type of fortune. Until the late period of the republic landownership on a large scale and tax farming remained the only significant means of piling up really large fortunes. It was only with the conquest of the East and the formation of the empire that interprovincial commerce became important and provided opportunities for large scale accumulation in maritime and trading operations. At the same time the Romans highly developed the extra-economic but typical means of acquiring wealth: the collection of tribute from conquered peoples and the exploitation of provinces by the incumbents of high positions in the administration. In the course of time tax farming became a monopoly of the military class, and the considerable fortunes acquired thereby were increased further by syndicate operations. The wealth accumulated from maritime and wholesale trade was also invested in money lending and later quite frequently in land. The amount of capital employed in money lending operations was quite large even in the late republican period; in Pompey's time the municipalities of Asia Minor were indebted to Roman money lenders to the extent of \$40,000,000.

The possibility of building up large fortunes by means of tax farming disappeared during the empire with the development of state machinery for financial administration. And after the third century, with the steady decline of trade and general economic regression, large fortunes were possible only in the form of *latifundia*. Some idea of the size of landed estates in the early period of the empire is given by Pliny, according to whom half the land of the north African province in Nero's time belonged to six great landlords. Trimalchio, a typical business man of the time, drew an enormous revenue from the wine trade and ownership of *latifundia*. Seneca, the richest man of Nero's reign, combined in a characteristic fashion the exploitation of *latifundia* with money lending on a large scale. Fortunes, particularly in the earlier period of the empire, were enormous, some as much as 400,000,000 sesterces, or \$16,000,000—large even according to modern standards. Wealth was the badge of distinction; the amounts of their wealth and income were inscribed on the tombstones of rich men.

CLEMENS BAUER

MEDIAEVAL AND EARLY MODERN PERIOD. The great Roman fortunes disintegrated with the collapse of the empire. Industry regressed to primitive forms, trade almost completely disappeared and the new economic and political conditions were unfavorable to the development of large fortunes.

From the early Middle Ages to the period of the crusades private fortunes appeared in Europe predominantly in the form of landed possessions, i.e. the real property of a feudal class of ecclesiastical and lay landlords. Large money fortunes scarcely existed. The only significant exceptions were represented by the Templars and the Teutonic Knights, the latter accumulating great wealth through the export of agricultural and forest products. As a general principle non-landed fortunes could develop only after the production of goods for local needs developed into regular production for profit. This was the case toward the end of the Middle Ages with the great English landlords, who during the period of enclosures adopted sheep raising for wool, and with the nobility of Schleswig-Holstein, some of whose representatives early accepted capitalistic agriculture. In general, however, large money fortunes appeared in the city, particularly among a few great merchants of certain Italian cities and a few cities outside of Italy, which were developing as the key trading centers of Europe.

Jews represented a considerable percentage of these early possessors of money fortunes. The great majority of the large Jewish fortunes of the Middle Ages developed from small beginnings in the trade in secondhand goods, pawnbrokerage and the trade in precious stones and acquired greater importance through loans to ecclesiastical and lay princes. As early as the eleventh century and during several pontificates a banking family of Jewish origin, which later took the name of Pierleoni, played an extremely important role in papal finances. Early in the Middle Ages the Jews recognized the value of accumulating wealth on a large scale by financial dealings with the lay princes, particularly in England and the Iberian Peninsula. To be sure, this was almost nowhere accomplished undisturbed; more or less extensive confiscations by princes and state authorities repeatedly interrupted the growth of Jewish fortunes.

The growth of non-landed fortunes in Christian ownership during the Middle Ages was also subject to interruption by confiscations, either openly or in the masked form of forced loans.

A part of these fortunes originated in dealings in money. All over Europe money changers and money lenders from Lombardy and from Cahors in southern France set up their tables for the exchange of money and pawnbroking; with the growth of their "banks" they were able frequently to engage in the business of high finance. These developments provided many opportunities for the accumulation of great private fortunes, particularly where certain state revenues, such as tolls, coinage and taxes, were transferred to creditors in payment of their loans.

Trade played a more important part than money changing and loans in the rise of non-feudal fortunes. During the crusades various merchants from central and northern Italy built up an exceedingly profitable trade with the Levant, and this was followed by the growth of capitalistic export industry in dozens of Italian cities. This foreign trade yielded enormous profits, particularly the oriental trade in luxuries. In Venice and Genoa the Italian mercantile fortunes advanced rapidly until they reached the peak of their development and also their highest political and economic importance in the large international and financial transactions with popes and kings. During the Middle Ages and well into the sixteenth century in Italy and other economically advanced countries ground rents were not essential to the building up of great bourgeois fortunes; in fact, landownership was important from this point of view only as the means of safeguarding wealth and strengthening credit. There was at the same time a growth in the fortunes of the feudal monarchs and nobility as a result of the general economic expansion.

In the sixteenth century the great south German merchants, the Fuggers, Welsers and Baumgartners, took their place alongside the Italians in the leadership of trade, industry and high finance after they had laid the foundations of their large fortunes in petty trade and had increased them, through fortunate profits from the mining industries, to the proportions necessary for the transactions of international finance. To a much greater extent than in the period of the German Hansa, capitalistic industry and international finance—especially in the two world bourses of the sixteenth century, Antwerp and Lyons—operated to produce great wealth and private fortunes and also to destroy them by state bankruptcy.

The development of European fortunes reached its climax during the sixteenth century in southern Germany. Even the richest Italian

merchants of the fifteenth and sixteenth centuries—the Medici, Grimaldi and others—had not been able to pile up fortunes so great as that possessed by the Fugger family corporation at the height of its affluence—in 1525 about 2,000,000 and in 1546 nearly 5,000,000 Rhenish gold gulden. These great money fortunes, both German and Italian, were partially destroyed during the second half of the sixteenth and the first half of the seventeenth century by the national bankruptcies of that period. Thereafter a more rapid development of private fortunes appears in the circle of "national" or at least nationalized merchants and financiers. In England the wealthy goldsmiths of London replaced the Italian bankers as professional money lenders to the crown. In the France of Mazarin's day two members of the famous Augsburg merchant family of Herwart were still the strongest financial pillars of the state, but they had already become completely Gallicized. The Herwarts combined the roles of bankers and state officials—comptrollers general of finance—and considerably increased their already large and powerful fortunes. Even more successful were the native French profiteers in the financial needs of the state, the farmers general: as farmers of taxes and state revenues (such as Fouquet, Rambouillet, Nogaret and others) they acquired such enormous incomes in a short time that one is forcibly reminded of the lucrative tax farming of antiquity, especially in the Roman Empire. Both Richelieu and Mazarin accumulated large fortunes by means of their political power.

Disintegration of the feudal system and the rapid development of capitalist enterprise accelerated the growth of private fortunes, although these were still closely linked to the old order. The domestic financial machinery in France, England and Germany, even in Holland in the seventeenth and eighteenth centuries, was inadequate to satisfy the increasing national and economic needs for mobile funds. A system of international finance was indispensable. Such a system was slowly arising among the Jews and created new European fortunes. In England the Jewish financiers after a hundred years of exile were readmitted under Cromwell to relieve the financial straits of the Long Parliament; these financiers occupy an important place in the history of English private fortunes.

The forces of feudal disintegration and commercial revolution had been powerfully accelerated by the discovery of the New World, which gave an enormous impetus to the accumulation

of wealth and the growth of large fortunes. English sea trade and colonial enterprises, including trading companies, plantations, the conquest of India, piracy and the slave trade, opened up new sources for the rise of private fortunes; the Spaniards acquired immense riches from the gold and silver of the New World. Colonial enterprise appeared earlier in Holland and brought great wealth; the Amsterdam Bourse, that great gold reservoir which in the eighteenth century replenished the empty coffers of the princes of half of Europe, provided rich Dutchmen and the international owners of large money capital with a field for the profitable investment of their funds in colonial as well as European enterprises. French money was also active in colonial enterprises, although less so than money from other countries. In Germany the older methods were still the more important, and the larger and smaller courts afforded increasing opportunities to the so-called court Jews for making fortunes by financing the trade in luxury goods and providing credit for munitions and army supplies.

In these developments of the commercial revolution one can see gradually emerging the typical forms of the great modern private fortunes which arose during and after the industrial revolution, growing out of large scale manufacturing, promotion, speculation and the unearned increment from urban and rural landholdings produced by industrial development.

JAKOB STRIEDER

MODERN PERIOD. While in seventeenth century Europe fortunes were piled up out of trade, finance and industry, accumulation in the North American colonies assumed at first the more primitive form of large landholdings. Spaniards acquired fortunes by plundering the Aztec and Inca civilizations, but farther north there was only land to wrest from the aborigines. The English kings gave title to vast domains to their favorites, usually pauperized aristocrats, who combined with merchant capitalists to exploit the grants. Alongside and within the proprietary grants great landed estates were created. In the New Netherlands the Dutch also built up large landholdings; the 700,000-acre estate of Killiaen van Rensselaer was not unusual. These manorial estates were worked with the aid of tenants and indentured laborers. Farther south the plantation system was based on Negro slavery; thus some of the earliest colonial fortunes in Virginia were based on the cultivation of tobacco by slave labor. Even after the colonies reverted to the

British crown the accumulation of large landholdings continued, although some of the older ones were broken up. Entailing of land was extensively practised. The colonial manorial estates represented the transplantation of an essentially feudal type of fortune, but they functioned in an environment which the commercial revolution of the seventeenth century was rapidly transforming into a capitalist economy; in fact, they depended for the profitable disposal of their products upon trade with England.

Another source of private fortunes was overseas trade, which came to occupy a prominent place toward the end of the seventeenth century. By 1680 there were thirty merchants in Massachusetts each worth between \$50,000 and \$100,000. The fur trade, which supplied the growing luxury demands of the European aristocracy of blood and money, yielded large profits, mainly for the masters of the Hudson's Bay Company in England. The slave trade, which never before had been organized on such a vast scale, was a particularly fertile source of large private fortunes. Money lending and a crude form of banking developed to meet the needs of commerce, constituting another source of accumulation. By the time of the American Revolution mercantile fortunes were disputing supremacy with landholding fortunes, although land still enjoyed social recognition as the dominant form of wealth. The father of James Fenimore Cooper owned a manorial estate of huge proportions and boasted that there were "some 40,000 souls holding land directly or indirectly under me."

The revolution dispersed some fortunes, particularly among the loyalists whose estates were confiscated, but others became larger and new ones were created, mainly by financiering, speculation and privateering. One revolutionary privateer, Israel Thorndike, later increased his wealth from mercantile and manufacturing enterprises, accumulating a fortune of \$1,800,000. Speculative fortunes were enormously augmented when the new federal government assumed \$70,000,000 of national and state debts; most of the bonds were in the hands of a few speculators, who had bought them at 10 to 15 percent of their face value. Mercantile fortunes based upon the expansion of trade and industry increased swiftly after the revolution, and manufacturing fortunes made their appearance. One capitalist amassed \$130,000 from the glass industry and another \$400,000 from the furniture industry. Stephen Girard, who left a fortune of \$7,000,000, derived his wealth largely from

speculative manipulations in trading, shipping, banking and manufacturing enterprises.

With the further development of capitalist enterprise fortunes based on agricultural land-ownership definitely receded in importance. The protests of tenants forced legislation breaking up the manorial domains, and the earlier abolition of entail and primogeniture had a similar effect. As large agricultural estates disappeared in the east, land fortunes came to consist of urban realty holdings the value of which increased enormously with the rapid growth of cities. Similar fortunes arose in the west—in Chicago, Cincinnati and St. Louis. According to a list published by the *New York Sun* in 1846 of the 19 New York millionaires who owned an aggregate of \$65,000,000, 8, including John Jacob Astor and E. van Rensselaer, were landowners and 7 were merchants. But the original accumulation of Astor, whose fortune of \$20,000,000 was the largest in its time, came from the oriental trade and the fur trade, and it was multiplied by speculation in New York real estate. According to the same list, of the 78 fortunes of \$500,000 and over in New York City 26 were owned by merchants, 17 by landowners, 5 by manufacturers, 4 by bankers and 3 by brokers.

The merchant capitalist was now the dominant type. Fortunes based directly on manufacturing were still rare; a contemporary chronicle said of one rich man that he had "managed, strange to say, to obtain large profits and wealth" from manufacturing. In 1845 of 9 Boston millionaires only 2 engaged in manufacturing. But the designation merchant covered at the time a multitude of interests. While merchants did not pioneer manufacture, which was still considered risky, they financed the distribution of its products and secured thereby a large share of the manufacturing profits. Thus in 1834, 85 percent of the Boston merchants were closely connected with manufacturing enterprises. Differentiation proceeded steadily, however; many merchants became industrial capitalists and others abandoned trade for finance. The great American investment banking houses were originally mercantile firms; George Peabody gave up trade for international finance and acquired a fortune approaching \$10,000,000 out of the American need for foreign capital. Merchants and bankers promoted railroads, the rapid development of which offered an unexcelled opportunity for profit; and Jacob Little was already demonstrating how a fortune might be acquired by railroad manipulation and speculation. The characteristic modern

fortunes began to emerge, based upon the development of industrial and financial capitalism.

Modern capitalist fortunes appeared much earlier in England. Immense wealth had poured into England from overseas enterprise and chartered companies such as the Africa Company and the East India Company, most of which combined trade, slaving and colonial plunder; the great wealth acquired by English adventurers in India led to the use of the term nabobs to designate the newly rich. Security speculation made possible by the rise of joint stock companies culminated in the organization in 1711 of the South Sea Company, the promoters of which were mainly wealthy merchants. When the South Sea bubble burst, as its predecessor the Mississippi bubble had burst in France, thousands of people were ruined but the insiders realized handsome profits. Meanwhile, in the nooks and crannies of the English economy forces accumulated which were to create new sources of riches, to change the form and increase the size of private fortunes. The industrial revolution not only multiplied wealth but also accentuated its concentration. The earlier fortunes directly connected with the industrial revolution were made by new men; only after the new industries were successfully established did they prove attractive to the rich families of older standing. But the industrial revolution also enriched aristocratic landowners whose lands contained deposits of coal, iron and other minerals, and whose ancestral privileges enabled them to levy tribute on economic progress. The earliest of the new capitalist fortunes arose out of the coal and iron industries. Although Henry Cort, whose processes transformed iron making, died a poor man, the ironmasters who violated his patents amassed huge fortunes. One ironmaster, who started "at the bottom," died in a castle and left £1,500,000. In the districts of south Wales, where the new industrialism flourished most vigorously and where labor and social conditions, according to one authority, combined "the worst features of the industrial revolution," men in a few years amassed fortunes of unprecedented size. The growth of textile factories in England destroyed the village economy of India based on handicraft weaving but it also produced another crop of millionaires. One fortune of £5,000,000 had its source in the manufacture of carpets by machinery. In the succeeding generations steamships and railroads provided new means for the accumulation of wealth. George Hudson secured for a while a large fortune by unscrupulously ex-

ploiting the railway boom of the forties with its consolidation movement. Investment bankers (Rothschilds, Barings) garnered great profits from the export of capital for government loans and for financing railroad construction on the continent, in the United States, in Latin America. Never before had wealth and fortunes piled up so swiftly as in capitalist England between 1815 and 1860, and never were the conditions of the working class more miserable. At the same time land fortunes still remained powerful; even after the Reform Bill of 1832 land represented political power and social prestige. While aristocratic landowners had their wealth increased beyond the dreams of their ancestors by industrial and urban growth and by corporate investments, industrial and financial capitalists bought landed estates in order to qualify for titles and social position.

Capitalist development on the continent thrust up new fortunes and increased the size of old ones, paralleling English developments on a smaller scale. As the financial manipulations of the Rothschilds spread beyond Germany, they became the most powerful factor in the circles of high finance. At the end of the eighteenth century they were worth only \$450,000, but with the development of capitalism they broadened the scope of their operations and immensely increased their wealth. Thus between 1817 and 1848 the Rothschilds placed loans of \$650,000,000, often at 10 percent interest. Their function may be described as the mobilization for capitalist investment of the wealth of the feudal and semifeudal aristocracy based on precapitalist forms of exploitation. The spread of industrialism and corporate enterprise encouraged promotion and speculation, the sources of many contemporary fortunes. The *Crédit Mobilier*, which offered competition to the Rothschilds, paid dividends of 12, 40 and 22 percent from 1854 to 1856 and then crashed. France under Louis Napoleon was the paradise of unusually corrupt and predatory promoters and speculators (including the emperor); other fortunes were derived from more prosaic activity in industry, particularly coal, iron and textiles. All over the continent railroads were built, preparing the way for industrialism and enriching their promoters. Holland was no longer the important power it had been in the sixteenth and seventeenth centuries, but the Dutch merchant capitalists continued to draw wealth from the exploitation of their colonial possessions; the Dutch East India Company created many fortunes, and

important colonial officials usually retired as wealthy men. The extremely rapid industrialization of Germany was the basis of several large fortunes. Alfred Krupp, who inherited an iron business with neither capital nor credit and only four workers, became one of the richest of European capitalists. Krupp's fortune was fed from three sources: industry's enormous demand for iron and steel, the industrialization of war and political favors. The Siemens family amassed a fortune from invention and expansion in the electrical industry; the Rathenaus, from electric light and telephones; others, from the development of the chemical industry. No great German fortunes, however, were identified with development of the railroads, which in the period of greatest expansion were owned by the government. Aristocracy in Germany, almost as much as in England, allied itself with capitalism and enormously increased its wealth. The feudal landowners of Upper Silesia, for example, piled up great fortunes by the exploitation of coal, iron and other minerals on their estates; others participated in industrial and speculative enterprises, often of the most shady character. Feudal Russia felt the impact of economic change, and merchants, often illiterate, acquired great fortunes by trading and speculating in agricultural and forest products; the great fortunes, however, were still aristocratic; the wealth of one nobleman amounted to \$200,000,000.

By 1880 the industrialized nations of Europe—Great Britain, Germany, France and Belgium—were actively engaged in the struggle for imperialistic supremacy which led inexorably to the World War. Imperialism, the predatory aspect of the industrialization of the world's economy, became a most important factor in the formation of private fortunes. Capitalist industry came increasingly to depend upon overseas trade, the export of capital and the exploitation of economically backward countries as the source of cheap raw materials and even cheaper labor. Immense profits were made in China by financiers, promoters, speculators and ordinary adventurers. Bankers and speculators made large profits out of the financial and political intrigues of the Berlin-Bagdad Railway, which sharpened imperialistic antagonisms. The Mannesmanns profitably exploited iron mines in Morocco, which brought Germany and France to the verge of war. Construction of railroads in Asia, Africa and Latin America yielded profits which in many ways suggested tribute levied upon the conquered. A cabal of Belgian aristocrats, finan-

ciers and speculators, headed by King Leopold, drew immeasurable wealth from the merciless exploitation of men, women and children in the Congo. French and Belgian financiers profited from the construction of the Trans-Siberian and the Chinese Eastern railroads in Asia. The mounting needs of industry for raw materials—oil, tin, copper, rubber—produced some native as well as many European fortunes; a landholding family in Chile increased its wealth to \$70,000,000 by the exploitation of minerals and a Bolivian family amassed a fortune of over \$200,000,000 from tin mines. Argentine cattle ranchers and Portuguese planters in Africa each in their way profited from international economic developments; Argentine millionaires became almost as famous as the American. A German, Alfred Beit, piled up a fortune conservatively estimated at \$150,000,000 from the gold and diamond mines of South Africa. Beit's business partner, Cecil Rhodes, made £1,000,000 in four years, mainly by consolidating diamond mines; Rhodes' British South Africa Company extorted profitable concessions from the natives and inextricably merged business interests with imperialism. The basis of empire, said Rhodes, is "philanthropy plus 50 percent"; his imperialistic schemes led directly to Britain's war against the Boers and the annihilation of their independence. An aspect of imperialism was the aggravation of competitive armaments; fortunes based on the armament industries increased greatly.

While capitalism produced the characteristic modern fortunes in European countries and the United States, older types of fortunes persisted elsewhere, although modified by capitalist influences. In Asia, Africa and Latin America the piling up of landholdings represented the typical form of accumulation. Chinese merchants amassed great wealth, particularly in the European colonies of the Pacific. Personal exploitation of political power yielded large fortunes to Porfirio Díaz of Mexico and Juan Vicente Gómez of Venezuela; the Venezuelan, who was a poor man when he became president in 1908, had a fortune twenty years later estimated at \$300,000,000. Both Díaz and Gómez maintained intimate relations with foreign concessionaires and financiers.

In 1902 there were in France 15,000 fortunes of 1,000,000 francs and over. In the same year the United Kingdom reported 273 inheritances of £80,000 and over, which included 22 of £500,000 and over—an indication of the great size and number of private fortunes, some of which ex-

ceeded £25,000,000. Private fortunes in Germany were smaller than the English but larger than the French; the five greatest German fortunes combined represented approximately 700,000,000 marks. Although agricultural land in England became more and more unprofitable, aristocratic landowners with estates in mining or urban districts were extremely wealthy; five dukes and two earls owned property valued at £70,000,000. The Duke of Westminster, who owned large parcels of London land, had an income of nearly £200,000, mainly from rents. A similar development was characteristic of the continent. In 1913 three of the five greatest fortunes in Germany were aristocratic: the Krupps led with 283,000,000 marks; Prince Henckel von Donnersmarck followed closely with 254,000,000 marks; then came a financier, a grand duke and finally the kaiser with 140,000,000 marks. The majority of private fortunes in Europe were capitalist, however; even the fortunes of the aristocracy were dominantly capitalistic in character.

Great as were the European fortunes they were much smaller than the fortunes piled up in the United States after the Civil War, which strengthened capitalism economically and liberated it politically. Negro emancipation and reconstruction destroyed the great land fortunes in the south, where accumulation had to begin all over again, but in the north accumulation based on capitalist industry attained unprecedented dimensions. American capitalism expanded more rapidly and on a larger scale than elsewhere. Relatively unhampered by vested interests of long standing and by the culture of an older civilization, armed with an almost "pure" acquisitive ideology which justified unrestricted money making, it drew upon the apparently inexhaustible natural resources of an undeveloped continent exploiting them with the aid of large masses of immigrant labor provided by Europe.

Appropriation and exploitation of vast natural resources was of fundamental importance in the formation of very large private fortunes. The Weyerhaeusers, whose wealth in 1914 was estimated at \$300,000,000, were identified with timber and allied resources, other great fortunes with copper, land, lumber, coal and oil. Most of the natural resources were originally part of the public domain, which in 1860 still consisted of 1,048,000,000 acres; but they came under the control of private interests by "the benevolent paternalism of a government" which, in the words of Charles A. Beard, "sold its natural resources for a song, gave them away, or permitted

them to be stolen without a wink or nod. . . . The public land office of the United States was little more than a center for the distribution of plunder." Not only entrepreneurs became rich by exploiting natural resources; somnolent farmers acquired wealth overnight by the discovery of oil or minerals in their lands.

Many great fortunes were wrested from the railroads in the period following the Civil War. Yet the legitimate construction costs of American railroads up to 1880 were more than paid for by federal, state and municipal contributions of \$700,000,000 and grants of 155,000,000 acres of public lands. Cornelius Vanderbilt's great wealth came almost exclusively from speculating in railroads and watering their stocks as an accompaniment of consolidation; he left \$100,000,000 and one of his sons \$200,000,000. The *Crédit Mobilier* extorted from the Union Pacific Railroad more than \$40,000,000 in excessive construction costs, which was distributed among promoters and politicians. Jay Gould's fortune of \$72,000,000 came mainly from railroad speculation and manipulation and was identified with scarcely any constructive achievement. Collis P. Huntington and others exploited the railroads in similar fashion. When speculation, mismanagement and competition drove the railroads into bankruptcy, wages were cut and thousands of small investors were ruined but reorganizations yielded large profits to financiers and promoters. Part of the Morgan money and power came from this source. Other great fortunes (Hill, Harri-man) were piled up by the consolidation of railroads into gigantic systems during the period from 1895 to 1905.

While the older fortunes did as a rule no economic pioneering, inventions revolutionized one industry after another and men of small capital who entered the new industries at an early stage of their development amassed immense profits. Cyrus McCormick acquired a large fortune in developing agricultural machinery and George Westinghouse in electrical manufacturing. The Standard Oil Company between 1882 and 1906 paid out \$548,436,000 in dividends and other millions were represented by equipment and cash resources; the company's stockholdings at the time were highly concentrated. Technological changes, large scale production and competition drove inexorably to industrial concentration and corporate combination. The profits of organizing combinations were astonishing; the series of combinations in the steel industry which culminated in the United States Steel Corpora-

tion yielded the promoters profits of at least \$150,000,000. Profits of this type were often fortuitous; in order to prevent the revival of ruinous competition Andrew Carnegie was paid \$447,000,000 for his steel interests, twice what he would have accepted two years previously. Fortunate investors in some of these combinations became wealthy, others were ruined; but moderate fortunes steadily increased. By 1900 the industrial capitalist had become a financial capitalist interested in a multitude of enterprises, promoting, speculating, financing. The Standard Oil group of multimillionaires, an oligarchy dominated by John D. Rockefeller, engaged extensively in promotion and speculation; "their resources are so vast," said one financier, "there is an utter absence of chance" in their manipulations. Another source of great fortunes (Drexel, Morgan, Stillman) was investment banking, growing with the expansion of corporate enterprise and allied with promotion.

The swiftly rising stream of national wealth also provided many minor opportunities to accumulate fortunes—patent medicines, journalism, the law. Moderate wealth was amassed by corrupt politicians, but on the whole politics favored predatory business men more than corrupt politicians; it served the capitalist class in general and special capitalist groups in particular. The beginnings of American imperialism swelled the stream of wealth; William R. Grace acquired a substantial fortune by industrial and financial enterprises in Peru, and after 1900 an increasing number of American fortunes were derived from exploitation of the natural resources and peoples of Mexico and other Latin American countries.

In 1892 the New York *Tribune* published a list of 4047 American fortunes of \$1,000,000 and over. A classification based on this list shows quite clearly the change in the character of American fortunes since 1845. Of the 4047 millionaires, 1140, or 28 percent, were identified with manufacturing; among them were 93 patent medicine manufacturers, 81 brewers and 58 publishers. The next largest group, merchandising, numbering 986 millionaires, represents an extremely broad classification, since most of the great merchants engaged in other enterprises as well; thus of Marshall Field's \$120,000,000 estate his interest in Marshall Field and Company was valued at only \$3,400,000, the balance consisting of investments in real estate and 150 industrial, public utility and financial corporations. There were also 468 fortunes connected with real es-

tate; 410 with transportation and communication, including 186 railroad and 12 telephone and telegraph magnates; 356 with banking, brokerage and insurance; 268 with mining, of which 72 were based on the production, refining and transporting of oil; and 168 with forest ownership and lumber manufacture. Of the 84 millionaires who derived their fortunes from agriculture 47 were western cattle ranchers, a group of whom President Roosevelt's land commission said that "hardly a single title is untainted by fraud"; 15 were owners of plantations in the south; and 6 owned plantations in Latin America. The professions contributed 73 fortunes of \$1,000,000 and over; 65 of them belonged to lawyers, mostly corporation lawyers, and only 3 were based on accumulations of patent royalties. The remaining 94 fortunes were obtained from a great variety of pursuits, the only homogeneous group of any size being represented by 24 hotel and restaurant owners. This accumulation of great wealth outstripped improvement in the conditions of workers and farmers.

The World War and its aftermath profoundly affected the formation and growth of private fortunes. In the United States the number of persons with yearly incomes of \$100,000 and over increased from 2290 in 1914 to 6633 in 1916. During the period of American participation in the war accumulation was not so great because of severe taxation and the depreciation of fixed incomes, although fortunes connected with war industries and speculation increased tremendously and many new fortunes were created. European developments were similar. Then revolution and inflation on an unparalleled scale brought profound changes. The communist revolution in Russia resulted in the confiscation of great private fortunes with the general expropriation of the feudal and bourgeois classes, while the Succession States broke up the large estates of German and Austrian aristocrats; in other countries, particularly in England, severe taxation brought about a similar shrinking of many landed fortunes. During the inflation period in Germany many private fortunes were completely wiped out and none escaped intact. Out of the general ruin a few monstrously large fortunes arose. Operating by means of paper mark credits Hugo Stinnes pyramided his purchases of distressed properties until he was in practical control of 1535 enterprises in mining, manufacturing, transportation, finance, and journalism; but deflation and his sons' incapacity destroyed this

vast aggregation of wealth. Inflation and deflation wrought similar results in other European countries but on a smaller scale. Because of economic crisis and decline accumulation in post-war Europe consisted mainly in the redistribution of existing fortunes; new fortunes were based on financiering and speculation, although the growth of certain industries, such as munitions, electric power and automobiles, played a considerable role.

In the United States the post-war period was characterized not only by a large increase in national wealth and income but also by an unequaled growth of great private fortunes. The causes must be sought in an unusually rapid expansion of several new industries, such as automobiles, radios, chemicals and moving pictures; a parallel growth of certain older industries, such as electric power; and a great increase in labor productivity of which only a small share accrued to wages. This rapid economic expansion produced an immense increase in speculation, which constituted one of the most fruitful sources of accumulation. Speculative gains reported by income taxpayers increased from \$1,172,000,000 in 1923 to \$4,556,000,000 in 1929; one half of the income of persons with incomes of \$100,000 and over was derived from speculative gains. Large profits were realized also from the wave of mergers and combinations which swept the country before the crisis of 1929. The number of incomes of \$50,000 and over rose from 12,452 in 1923 to 38,650 in 1929 and incomes of \$100,000 and over rose from 4182 to 14,701, accompanied by a substantial increase in the unequal distribution of income. On the basis of income statistics there are approximately 35,000 millionaires in the United States compared with 7000 in Great Britain and considerably fewer in other countries. In 1929, 504 American multimillionaires with incomes of \$1,000,000 and over possessed claims to wealth amounting in the aggregate to \$35,000,000,000, or one third more than the national wealth of Italy. The wealth of these great private fortunes is represented by investments in an extremely diversified group of corporate enterprises with a backlog of government securities; landownership is relatively unimportant except in the case of a few fortunes based on urban realty. Since the war imperialistic expansion has become increasingly important; in 1930 American foreign investments (excluding war debts) amounted to \$17,500,000,000, ownership of which is concentrated in the larger private fortunes.

The characteristic form of modern capitalist fortunes—paper claims upon wealth and income—contrasts sharply with older types of fortunes. The wealth of the aristocracy was bound up with land, the accumulations of industrial capitalists with particular enterprises; both had a tangible form and definite habitation. Contemporary capitalist fortunes, on the contrary, are liquid, mobile, intangible, bound up simply with general rights of ownership. At the basis of this development are the concentration of industry, the separation of corporate ownership and management and the transformation of the industrial capitalist into the financial capitalist. One aspect of these changes is the separation of great family fortunes from the particular enterprises with which they were identified in the earlier stages of capitalism. This process has gone farthest in the United States; industrial family fortunes persisted much longer and on a larger scale in Europe, but even there separation proceeded rapidly after the World War. This increasing intangibility of ownership contributes to the illusion that family fortunes are disintegrating. Family fortunes on the whole do not disappear, although split up among many heirs, but tend to lose the dynamic character of the original accumulation and seek safety in investment counsel, trust companies and government securities. This is especially true of the fortunes of women, the number of which is increasing mainly as a result of inheritance, insurance and divorce settlements. It has been estimated that trust companies in the United States are more or less actively engaged in the management of fortunes amounting to \$25,000,000,000. The development of trust companies and diversified investment insure greater stability for private fortunes.

These fortunes are separated from direct participation in industry; their owners constitute a class of investors, absentee capitalists, while management and control are institutionalized. Because of this the possession of fortunes does not generally carry responsibilities with regard to the source from which the wealth is derived. The lord of the manor had definite obligations, either legal or customary, to the tenants on his land, the serfs who cultivated his demesne and household servants. Where the industrial capitalist recognized obligations to the workers in his factory or the consumers of his product, they were forced upon him by his identification with a particular enterprise. The modern financial capitalist, whose fortune may be scattered in scores of enterprises and in almost as many

countries, effectively escapes such responsibilities. Even if he owns a large block of securities in a particular enterprise he may plead—as he does on occasion—that the responsibility is not his but that of the management. These economic and social changes are accompanied by a change in the forms of conspicuous consumption characteristic of private fortunes; it becomes more individual and personal in contrast with the many social aspects of conspicuous consumption in ancient and mediaeval civilizations.

The rich man of the twentieth century is not only separated from direct contact with production and its social obligations but he also plays a minor role in the cultural life of society. In the past great private fortunes were important cultural influences; formal culture was closely linked to the courts of the rulers of antiquity, the castles of the feudal lords in the Middle Ages and the social activities of the princes of commerce and finance in the succeeding centuries. This influence must not be exaggerated; but while no creative role can be attributed to wealth as such, the rich formerly actively encouraged culture and served as its conspicuous representatives. This can scarcely be said of the possessors of large fortunes who constitute the isolated and exclusive coterie of contemporary American "society." In the United States private wealth still exerts considerable indirect influence in education, social work, organized religion and other fields; but in countries of older civilization, where the welfare and cultural activities of government cover a much wider area than in the American community, such opportunities are much more restricted.

Great private fortunes are an extreme manifestation of the unequal distribution of wealth, of which poverty is the other extreme. They constitute a social relationship sustained by law and inseparably bound up with private property and class rule. All legislative attempts to limit the growth and size of private fortunes have failed; thus they increased tremendously in the United States following the introduction of inheritance and income taxes. There are checks upon private fortunes in the movement of economic forces (price fluctuations, economic decline) and in confiscation, of which a partial form is unusually severe taxation; but the general tendency is to increase, since private fortunes are inherent in any social system based upon private property. The revolutionary bourgeoisie, which objected to great feudal fortunes and in some cases expropriated feudal possessions, considered the "free

ownership" of property equivalent to social equality; but bourgeois private property constituted the starting point of accumulations greatly exceeding the feudal fortunes. In the United States the middle class during the period from 1880 to 1914 waged bitter war upon "tainted wealth" and "swollen fortunes," but this class defended private petty enterprise in which corporate wealth originated, one of the typical sources of great American fortunes. The forms of fortunes change as institutions change; their permanent essentials are private property and class rule.

Fortunes are primarily institutional in their origins. Personal characteristics—ability, duplicity, acquisitiveness—may explain why one man instead of another acquires great wealth but not why fortunes can be accumulated nor why few, many or no fortunes are piled up in different epochs and social systems. Nor is function an explanation of great fortunes. The capitalist entrepreneur who pioneers in the organization of an industry may acquire a fortune in the process or it may be snatched from him by more fortunate individuals; in either event the wealth secured is not necessarily commensurate with the function performed. Moreover, fortunes in the second or third generation are completely separated from the original function and become simply the private ownership and accumulation of social capital. The functions of organization, ownership and accumulation are strictly defined by prevailing institutions; other institutional arrangements, as in the Soviet Union, may perform the functions in a fashion which does not result in the piling up of private fortunes.

FOSCOLO, UGO (1778-1827), Italian poet and patriot. Foscolo was born at Zante of a Venetian family. He is celebrated primarily as a great poet but is also important in the social sciences as one of the first to voice the national sentiment which developed in Italy in reaction to the ideas and wars of the French Revolution. As a journalist contributing to the Milanese *Monitoro italiano* during the Cisalpine Republic he contended that had France granted inde-

pendence to Italy instead of treating her as conquered territory she might have gained a powerful ally. Much later, at the time of the Franco-Piedmontese alliance of 1859, the cogency of this argument was recognized. In an *Orazione* (in *Opere*, vol. v, 1850, p. 35-67) addressed to Bonaparte in 1802, while Foscolo was holding a precarious professorship at Pavia, he made the courteous but audacious request that the First Consul respect Italian liberty and specifically that he allow no officials to be chosen except Italians. After the downfall of Napoleon Foscolo went into voluntary exile in England. There he prepared his chief political work, *Della servitù dell'Italia discorsi quattro* (in *Opere*, vol. v, p. 171-259). In opposition to the current opinion he insisted that the prerequisite for Italian reconstruction was the dissolution of the secret societies and their replacement by political parties. The regime of the secret society he defined as "a perpetual state of schism brought about and maintained by a number of men who, cutting themselves off from a civil community, profess religious, moral or political opinions to disguise secret interests and to forward them by action contrary to the good of the community"; the party, as an "association of free men, with diverse opinions or interests as to the particulars of governing public opinion, but who, wherever the common safety and glory are concerned, become reconciled with their adversaries." Although Foscolo himself recognized that his idea was impracticable for the Italy of his time, it is nevertheless significant as one of the best instances of the imitation by Italians of English liberal doctrines. A *Lettera apologetica* written by Foscolo (in *Opere*, vol. v, p. 489-609) contains a penetrating criticism of the theory of natural right and outlines an original doctrine representing liberty not as an attribute of primitive society but as the culmination of the evolution of civil rights.

FOSTER, WILLIAM ALEXANDER (1840-88), Canadian lawyer and publicist. Just prior to Canadian federation in 1867 Foster, while

still a beginner in the law, opened his short public career with some essays in political journalism in Canada and England. In 1868 at Ottawa he was thrown into contact with four young men who had devoted themselves to furthering Canadian development and with them pledged himself "to put our country first, before all personal, or political, or party considerations." The west seemed to afford an object for national endeavor, and in Toronto Foster and his friends with the assistance of the *Globe* gave increasing publicity to the potential importance of the province of Manitoba. The rebellion of Riel and the métis of Manitoba against the dominion aroused during the summer of 1871 an excitement in Ontario which the young publicists capitalized, although Foster himself tried to transcend the incident by means of a broad appeal to national confidence and energy. His views were first publicly expressed in the issue of the *Globe* of July 17, 1871, which prematurely published a lecture which he had intended to deliver, under the title "Canada First." In this manifesto Foster reviewed national history, recalled Canadian autonomy and urged his fellow countrymen to repudiate defeatism and dependence and to unite in a program for developing the northern half of the continent. There was a broad popular response and the Canada First movement began. In 1874 Foster played an active part in the founding of the *Nation*, the National Club and the Canadian National Association. While desirous of maintaining the British connection he advocated increased Canadian autonomy in the making of treaties and greater local jurisdiction over the militia. As a means of securing a more efficient government and protection for minorities he urged franchise, electoral and senate reform. His idea of encouraging immigration by free homestead grants later became the accepted national policy, and from 1878 to 1891 Macdonald preserved his political power by means of the protective tariff policy advocated by Foster in 1874. Foster hoped to keep clear of party politics, but because of the popularity of the movement Thomas Moss in 1873 and Edward Blake in 1874 carried his ideas into the Liberal party platform, while Foster himself retired to his law practise.

FOUCHÉ, JOSEPH (1759-1820), French politician and minister of police. Fouché was educated in the Catholic church, where the revolution found him teaching as a lay member of the Oratorians. He rose rapidly in the local Jacobin club, was elected to the Convention, abjured his religion and served as an advanced Republican representative on mission. After aiding in the overthrow of Robespierre he lapsed into poverty and obscurity, whence he emerged as confidential spy for Barras. Napoleon made him minister of police, and although he eventually quarreled with the emperor he built up an indispensable police system. Recalled during the Hundred Days, he committed his final treason when he turned over the provisional government to Louis XVIII in return for a place in the Restoration ministry. This last treason was too much for public opinion and he was soon dismissed to die in exile. As representative on mission at Lyons with Collot d'Herbois he drew up an *Instruction* which is an important document in socialist history. It is a bitter attack on the rich, on the merely bourgeois revolutionary, and insists that the new republic must be socially and economically egalitarian and anticlerical. But Fouché's real importance lies in the challenge his career offers to the historian of ideas. If one man can successively serve the Jacobin republic, the consulate, the empire and the Bourbon Restoration, the superficial inference is that these regimes were fundamentally alike. The answer is that Fouché was the perfect bureaucrat—not the stupid clerk of paper routine usually implied by that word, but a supple manipulator of the human material of government. His career suggests that such bureaucrats are often indispensable to modern government. But although Fouché worked for the ninth Thermidor by the same methods as for the Bourbon Restoration, those two events were politically very different. They were ultimately determined by forces quite beyond such men as Fouché.

FOUILLÉE, ALFRED JULES ÉMILE (1838-1912), French philosopher and sociologist. Fouillée is chiefly known for his theory of ideas

as forces. His idealistic and rather eclectic tendencies, especially in his last years, were in opposition to Durkheim's sociology, against which he argued the impossibility of reducing the moral to the social, the psychological to the collective. Morality is the science of the ends of individual and collective action determined by judgments of value on a basis of psychology, philosophy and sociology. Positivism must square with idealism, determinism with liberty (self-determinism by personal and social ideas as forces), science with conscience. Society does not exist by itself independently of individuals. The "collective representations," the "social conscience" (Espinas), are found nowhere but in personal consciences to which contingency is brought by the ideal. There are therefore only individuals, conditioned by social determinism, collective heredity and their free contract in processes of organization, which in a sense resemble yet differ profoundly from organic processes. A society is "an organism which realizes itself by conceiving and willing itself," a "contractual organism." In the most diverse civilizations, which are dependent upon historical and ideological factors even more than geographical and ethnic, the sense of solidarity progresses *pari passu* with the sense of individuality. The last stage in evolution will be the complete union of individuality and sociality under the most advanced form of the social contract.

FOUNDATIONS. *See* ENDOWMENTS AND FOUNDATIONS.

FOUR DOCTORS is the name applied to the Italian jurists Bulgarus (died 1166), Martinus Gosia (twelfth century), Jacobus (died 1178) and Hugo (twelfth century), all of whom were natives of Bologna and pupils of Irnerius. They formed the second generation of glossators, so named from their essential method, the exegeti-

cal gloss, or note, on the individual passages of the newly revived law books of Justinian. These glosses gradually developed into a complete commentary, culminating in the largely compilatory work of Accursius. Their writings are severely academic and are an unsurpassed attempt to master the entire Justinian code. The pure Romanistic tradition was handed down by Bulgarus, his pupil Johannes Bassianus and the latter's pupil Azo to Accursius. Only at the end of the twelfth century did the influence of current practise, Germanic custom and canon law make its appearance.

A classical incident is the appearance of the Four Doctors at the Diet of Roncaglia in 1158, which was summoned by Frederick I to advise on the extent of the *jura regalia* and which decided in favor of the emperor's right to tax the Lombard cities. Until the glosses of the four have been studied systematically in pre-Accursian manuscripts, individual characterization will remain difficult. Jacobus and Hugo are somewhat shadowy figures; more is known of Bulgarus and Martinus. Bulgarus spent his life at Bologna teaching civil law like the others but also taking part in public affairs. His treatise *De iudiciis* (reprinted in Waehrmund, L., *Quellen zur Geschichte des römisch-kanonischen Processes im Mittelalter*, vol. iv, pt. i, Innsbruck 1925) and his notable commentary on the Digest entitled *De regulis iuris* (ed. by F. G. C. Beckhaus, Bonn 1856) are significant. Bulgarus' chief importance, however, like that of the other three, consists in his contribution to the tradition of the school, as his own glosses on all parts of the *Corpus juris*, the frequent citation of his work by Accursius and his prominence in the *Dissensiones dominorum* (ed. by G. F. Haenel, Leipsic 1834) bear witness. On controversial points he was almost always opposed by Martinus, his rival also for imperial favor. Tradition exalts both his science and his character at the expense of the latter, but then it is from Bulgarus that the tradition chiefly descends. The usual criticism of Martinus, a jurist of more radical tendencies, and of his followers, the Gosiani, is that of too liberal equity at the expense of legality. For that very reason Martinus was praised by Hostiensis the canonist. As the champion of living needs against the dead letter of legality and as the forerunner of the liberal ideas embodied in subsequent law, Martinus stands out as a more interesting figure than his opponent.

FOURIER AND FOURIERISM. François Marie Charles Fourier (1772-1837) was the scion of a middle class merchant family and participated in the defense of Lyons against the Convention troops in 1793. The bulk of his patrimony was destroyed during the revolution and he was forced for the greater part of his life to make his living as a traveling salesman and shop clerk. He produced a series of writings which have won for him a place along with a dozen other early nineteenth century utopians in the history of socialism.

Nineteenth century socialism bore many posthumous sons to eighteenth century rationalism, but none whose legitimacy is more completely authenticated than Fourier's. A rationalist among rationalists, he rejected contemporary society as monstrous, brushed aside consideration of the slow processes of institutional development and asserted the possibility of a social order governed by pure reason. He saw the perfect society as the final stage in a process of historical change whose principal epochs after the fall from Eden are savagery, patriarchy, barbarism, civilization, guarantyism, simple association and finally composite association or harmony. The society of his day, which he called civilization, he found unorganized, irrational, the prey of caprice, force and fraud. Although his thought was at times colored by materialist philosophy, he saw human reason as the prime mover in history.

It is hard to imagine anyone further removed from contemporary life than Fourier. He was oblivious of the possibility of utilizing to the advantage of man the revolutionary changes in production technique associated with the industrial revolution. In the huge volume of his writing there is scarcely any mention of the French Revolution, the conquests of Napoleon, the Restoration, the revolution of 1830 or any other of the epoch making events through which he lived. The key to his often penetrating criticism of the economic order is that he was an economist in the sense of one who economizes. The waste involved in a competitive organization of the distributive system appalled him, and he worked out in great detail the savings possible

through community kitchens, common living quarters and cooperative buying.

Remote from worldly considerations, Fourier deduces his plan of a future society from first principles derived from a complex and detailed analysis of human nature. He proceeds from a first approximation, which divides the passions constituting human nature into the senses; the affective passions, which determine social groups and combination; and the distributive passions, which lead to certain classifications and distinctions between groups, to higher and higher approximations laying bare human motives in all their detail. Once human nature has been thus analyzed it becomes clear to Fourier that the passions, if perfectly expressed, lead to a certain division and combination of human activity natural to a perfectly harmonious society. Human desires, needs and interests are determined at birth, and there is no reason to suppose that human nature changes from age to age. The qualities of man are as definite and unalterable as those of a physical object. History exhibits no process of individual adaptation to the environment. The problem which Fourier sets himself is the adaptation of society and the environment to the individual. The fact that contemporary society is so poorly adapted to the free expression of human desires he sees as the root evil from whence come all woes.

The fundamental unit of the harmonious society he desired to create is the phalanx (*phalanstère*), whose structure, size and functioning Fourier deduced from his analysis of the passions. Within the phalanx, which is composed of 1620 people cultivating some 5000 acres of land, each individual follows his impulses or passions completely and in so doing discovers himself to be acting not only in his own interest but also in the interest of the community and of society as a whole. This happy result is made possible by the action of a benevolent deity, whose universe has so distributed qualities among individuals and within individuals has so diversified the passions that to act by impulse is to act rationally and rightly in the ultimate and absolute sense of these terms. Once the laws of this universe are understood, reason has no further function and thought becomes "a disease of the flesh." "The passions are the work of the eternal Geometer; . . . He has not created them uselessly; they have a purpose; and it is necessary to determine this by fixed rules."

After working in isolation until about 1815

Fourier succeeded in gathering about him a number of ardent disciples who popularized his ideas. By far the most significant of these was Victor Considérant, who not only wrote voluminously for the movement but also founded a phalanx in Texas. Fourierism came to fullest fruition in the United States, where Albert Brisbane disseminated the idea and the "Furyites," as they were called, organized a number of colonies. Brook Farm was the most famous and the North American at Red Bank, New Jersey, probably the least unsuccessful. All were, however, only very rough approximations of the phalanx. The diversification of employment and the adaptation of the task to the individual inclination were never carried very far, and the life of all the enterprises was too short to permit of a thoroughgoing application of Fourier's essential principles.

While Fourier's school lacked the cohesion and the personalities of the Saint-Simonian group, its influence has in many ways been broader and more lasting. There still exists a small but active Fourierist group in France. The phalanx was essentially a cooperative conception and Fourier may be called the father of cooperation. His disciple Godin established at Guise a cooperative *famillistère* which is a Mecca for all those who are interested in the cooperative movement. Moreover, Fourier's demonstration of the wastes of the competitive order and of the possibility of joyous labor is perpetuated in the body of socialist dogma, and his bitter criticism of the prevailing marriage system has become a standard reproach against capitalist society.

Some ideas of Fourier were similar to those of Owen, and the two enjoyed simultaneous popularity in the United States. But Fourier was inclined to see in Owen's estimate of 3000 as the number of members for an ideal community distinct evidence of a faulty analysis of the diversification and distribution of human passions. While both Fourier and Owen looked to an abolition of the difference between town and country, Fourier's ideal was an agrarian-handicraft economy, Owen's a combination of agriculture and factory manufacture. Fourier envisaged human nature as determined at birth; the essence of Owen's thought was environmentalist. Fourier criticized the egalitarian character of Owen's proposals; his own were based on his view of individual differences. Then too the voluntarism of Fourier's scheme contrasts strongly with the socialist paternalism of Owen's scheme. While Fourier is distinctly

nearer the anarchists than Owen, his originality makes it difficult to describe his ideas as anarchism or even to classify him, in Kropotkin's phrase, as an anarchist-communist. While he was a critic of the capitalist order, the Saint-Simonian attack on inheritance struck him as revolutionary. He defended interest and profits as distributive incomes, and he even promised high returns to those willing to invest in a trial phalanx.

There is, despite a great deal of the fantastic and ridiculous and a verbiage so luxuriant as to seem at times that of a madman, a curious modernity and foresight in Fourier's thought. The importance of a study of individual aptitudes and inclinations in order to find the proper place in the economic mechanism for each smacks strongly of personnel investigation and management. The insistence on the necessity of self-expression has a strangely familiar ring. The ideal phalanx, described as a vast building in which food is prepared and delivered from common kitchens and eaten in common halls, in which services for all are performed by groups of specialists, in which purchases of all necessities may be made on the premises, is not far removed from the modern metropolitan apartment hotel.

EDWARD S. MASON

Paris 1851); Gide, C., *Introduction to Fourier's Oeuvres choisies* (Paris 1890); Wessels, Werner, *Charles Fourier als Vorläufer der modernen Genossenschaftsbewegung* (Bergisch-Gladbach 1929); Louvancour, Henri, *De Henri de Saint Simon à Charles Fourier* (Chartres 1913); Ryazanov, D., *Explanatory Notes to his edition of the Communist Manifesto*, tr. from the Russian by E. and C. Paul (London 1930).

FOURNIÈRE, EUGÈNE (1857-1914), French socialist. Fournière was at an early age a journeyman jeweler and later a proof reader; he had no formal education but was led by intellectual curiosity to extensive reading and study. After collaborating with Jules Guesde on *Égalité*, organ of the Labor party, he swung toward Benoît Malon and the "integralists." He created a sensation at the third workers' congress in Marseille in 1879 by denouncing Louis Blanc for his opposition to the Paris Commune. His militant socialism and trade unionism in the

strikes of Bessèges and the Grand'Combe in 1882 cost him eight months' imprisonment. He was a municipal councilor of Paris from 1894 to 1898 and a member of the Chamber of Deputies from 1898 to 1902. From 1905 until his death he directed the *Revue socialiste* and occupied chairs in the Conservatoire National des Arts et Métiers and the École Polytechnique.

Fournière's chief importance was as a theorist. He had read deeply in Fourier and Saint-Simon and recognized their influence; as apologist for a society which "liberates man from the domination of others without subjecting him to collective property" he continued the theories of Proudhon. Socialism, he contended, is not and cannot be a dogma. Born of the eighteenth century, it is intimately related to democracy, which is the political as socialism is the economic contract. He saw socialism as the enlargement and fulfilment of democracy and cited Marx and Engels to prove that it has its origins in democratic thought. Fournière maintained that the historical materialism of Marx, under whose influence he remained for a long time, distorted moral and political problems, and he desired to modify it by Proudhon's conception of justice as the dynamic force making for socialism. He retained the appeal to the class struggle, visualizing the growth of socialism through trade unions and the cooperative movement but differed from Marx, for example, in his beliefs that capitalist concentration would not be completed (the middle class growing rather than disintegrating) and that economic crises were becoming less frequent. Especially after the elections of 1906 he proclaimed the necessity of cooperation between workers and the middle class.

Consult: Louis, Paul, *Les étapes du socialisme* (Paris 1903) p. 277-79; Weill, G. J., *Histoire du mouvement social en France 1852-1924* (3rd ed. Paris 1924).

FOVILLE, ALFRED DE (1842-1913), French economist and statistician. Foville studied at the École Polytechnique, held various posts in the Conseil d'État and in the department of finance, lectured on economics in the Conservatoire des Arts et Métiers and at the École des Sciences Politiques, became member of the Académie des

Sciences Morales et Politiques in 1896 and was appointed permanent secretary of this academy in 1909. He combined scholarship with remarkable ability of lucid presentation of carefully chosen material. In the study "Les variations des prix en France depuis un demi-siècle" (in the *Économiste française*, 1874-78) he utilized the practise of French custom authorities of calculating the values of imports and exports twice, once at the moment of entry, according to the prices prevailing in the preceding year, and again at the end of the year, according to the prices of the current year. The two sets of figures were used by Foville to compile a chain index of price variations; helpful though it is, the index is subject to criticism in some respects. In *Études . . . sur la propriété foncière: le morcellement* (Paris 1885) he attempted to strike a balance between the advantages and disadvantages attending the division of landed property. After becoming director of the mint he devoted his attention to the problem of money, edited *Rapports du directeur des monnaies et médailles au ministre des finances, 1806-1890* (4 vols., Paris 1897-1900) and wrote *La monnaie* (Paris 1907), an excellent introduction to the study of money including a discussion of the relation between the quantity of money and variations in the price level. Foville made important contributions to the organization of statistics in France. He directed and presented the results of the valuable *Enquête sur les conditions de l'habitation en France* (2 vols., Paris 1894-99). When commissioned to reorganize the statistical service of the Department of Finance in 1877 he initiated the publication of the *Bulletin de statistique et de législation comparée*, which he edited until 1893 and which has been continued since by this department. His compendious *La France économique* (Paris 1887-90) is still useful as a source book of statistical information for this period and those preceding it. Foville frequently contributed to the *Bulletin* of the International Institute of Statistics, the *Journal* of the Société de Statistique de Paris and to the *Journal* of the Royal Statistical Society.

FRANÇOIS SIMIAND

FOWLER, WILLIAM WARDE (1847-1921), English historian and scholar. In 1872 Fowler was elected to a fellowship at Lincoln College, Oxford, which he held for nearly half a century. He was one of the early band of scholars and teachers who succeeded in raising the study of Roman history to the same high level in Oxford

that it had attained in Germany through the genius of Mommsen. The distinction of Fowler's work was due to a rare combination of vivid imagination and quick intuition with unwearying research and the logical estimate of evidence. The materials of learning were fused in his mind until they shone. Hence his most learned work possesses freshness and warmth, unchilled by any pedantry. Fowler's most important contributions lie in the field of Roman religion. The conventional classical scholar had been entirely ignorant of real Roman religion, and it is not too much to say that it was Fowler's writings on the subject that disclosed a new world of thought and experience to English students. He was one of the first to apply the new science of anthropology to the study of the classical world; and by his far reaching research and his creative imagination working on the fossil relics of old Roman ritual he was able to endow them with life and spirit and to reveal a strange religious mentality unfamiliar to the modern mind.

LEWIS RICHARD FARNELL

Important works: *Julius Caesar and the Foundation of the Roman Imperial System* (London 1892); *The City State of the Greeks and Romans* (London 1893); *Roman Festivals of the Period of the Republic* (London 1899); *The Religious Experience of the Roman People* (London 1911); *Roman Essays and Interpretations* (Oxford 1920).

FOX, CHARLES JAMES (1749-1806), English statesman. He was the son of Henry Fox, the first Lord Holland, a politician who made a fortune as paymaster general and became the most unpopular man in England. Fox was brought up in luxury and extravagance and he entered Parliament at the age of nineteen, a self-willed and dissipated young man and a violent Tory. He served as a junior minister under North but in 1774 joined the opposition to the American war, coming under the influence of Burke. In the next few years he made himself one of the leaders of the campaign for peace and democratic reform. After the fall of North in 1782 Rockingham formed a government in which Fox and Shelburne were secretaries of state. The two secretaries quarreled, their mutual suspicions being reenforced by definite differences of opinion, for Fox was much more anxious than Shelburne to reduce the king's power. When Rockingham died a few months afterwards, the king made Shelburne prime minister and Fox resigned. The next year he took a fatal step. Allying himself with North in

the hope of forming a government that would check the king's power he lost for some time the popular confidence which had been his chief strength. Although the coalition defeated the government on the peace it retained power only a short time, falling on its India Bill, against which the king had mobilized the opposition. Fox was out of office, except for a few months at the end of his life, for the rest of his career. In opposition he behaved sometimes factiously and recklessly, as in his attitude to the Regency Bill and to Pitt's wise commercial policy. But he redeemed his reputation by his brave and powerful stand against domestic repression during the French wars and by his wise and liberal pleas for moderation. The first French war he regarded as a war against liberty; this war was ended with the Peace of Amiens, and the war that followed the rupture of that peace was of a different character. Fox's quarrel with Pitt in this second war was based chiefly on Pitt's methods, for he held that Napoleon could not be fought successfully by bribing the sovereigns of Europe to resist him. Pitt's death in 1806 brought Fox into power for a few months. He tried to make peace with Napoleon but failed. On the other hand, he succeeded in putting an end to the British slave trade. This was a signal exhibition of his personal power, for the obstacles that had baffled Pitt for so long had not been removed by Pitt's death.

Fox was the first great Liberal leader in English politics. The best illustration of his temper was to be found in his admirable saying that he wished to make the people of Ireland the garrison of Ireland. He believed in peace, in self-government, in liberty of speech, in religious toleration, and he inspired a small but powerful element in the aristocracy with his generous ideas. He had the eighteenth century dislike for compulsion, but he was not a pedant, for he supported the proposal to fix a minimum wage in agriculture in 1795 rather than let the laborers sink into complete dependence on charity. He was the ablest debater of his age and a man of great personal charm.

JOHN LAWRENCE HAMMOND

(London 1859-66); Drinkwater, John, *Charles James Fox* (London 1928).

FOX, GEORGE (1624-91), English Quaker. Fox is generally considered the founder of Quakerism. He belonged to a mystical movement dating from the Middle Ages and existing strongly among the religious sects of the Commonwealth period in England. What characterized Fox was his hatred of priests of any kind and his belief in the voice of God, the "inner light" in all men. Church worship was abominable to him. His belief that God was in each individual led directly to his antipathy to "intermediaries," to his opposition to war and slavery and to his schemes for social reform. His pronouncement in favor of the freeing of slaves after a period of service started an agitation among the Quakers which led eventually to complete emancipation. His sufferings in prison enabled him to appreciate the need for prison reform, especially the classification and separation of criminals. He advocated the establishment of mental hospitals and special homes for the afflicted and disabled and urged "those that could work to work" (*A Warning to All the Merchants in London*, London 1658). He had a finer estimate of human nature than the Calvinists of his time and saw clearly the evils of seventeenth century English law, which rated property higher than human life. His social ideas seem as modern now as they were then.

In a political sense Fox mirrors a new and significant movement among the lower classes. To the Quakers the Puritan revolution in both its political and its religious phases constituted merely a successful attempt on the part of the landed gentry dominating Parliament to remove the grievances which under a variety of forms they had hitherto suffered at the hands of a tyrannical oligarchy in state and church. Fox, once a shepherd and a shoe apprentice, spoke for a group which tended in the main to be indifferent to the claims of monarchy and Parliament. He knew of a good with which the magistrates of the time were not concerned. His faith in the inner light led to an individualistic political doctrine with regard to the claims of formal authority. The law in general must be "witnessed" to by the voice of God in everyone; only then did law obtain validity. This he contended led to order not anarchy, because the laws were built upon the social conscience and thereby obtained obedience. Compulsion that neglected conscience was therefore wrong. Although aware of the danger inherent in such anti-authoritarian views Cromwell was deeply impressed by Fox's sincerity as manifested in several interviews be-

tween the two men, and largely because of this personal sympathy he was more indulgent than he might otherwise have been toward the Quakers.

P., *English Democratic Ideas in the Seventeenth Century* (2nd ed. Cambridge, Eng. 1927) p. 228-38, and *Political Thought in England from Bacon to Halifax* (London 1914) p. 152-57.

FOYNITSKY, IVAN YAKOVLEVICH (1847-1913), Russian criminologist. After studying criminal law, criminal procedure and penology at St. Petersburg, Berlin, Vienna, Leipsic and Paris, Foynitsky became judge of the Senat (imperial supreme court) and professor at the University of St. Petersburg. There he organized an institute and museum of criminology and was the first in Russia to give a course in penal institutions. As founder and president of the Russian section of the International Union of Criminal Law from 1897 to 1904 he worked for a reform of the fundamental conceptions of criminal law and criminal procedure in accordance with modern sociological criminology. He was a member of the commission which drew up the Russian criminal code of 1903. This code, reflecting in the main classical criminological theory and containing a few concessions to modern criminal science, such as conditional liberation and individualization of punishment, was never operative in its entirety. His individual contribution to the code was concerned with the penal system and with the crimes against property. To him the function of punishment was both to improve and to repress the criminal; but as punishments involved in repression were costly to both the offender and the state, he advocated that the most economical punishments be meted out. He was a decided opponent of exile as a mode of punishment. His works marked by erudition and by cautious utilization of the newer ideas in the field contain the first extensive and systematic discussions in Russia of Anglo-American law and penology.

FRANCE, ANATOLE (Jacques Anatole Thibault) (1844-1924), French critic and novelist. After a respectable but undistinguished career as a poet France was appointed literary critic of the *Temps* and between 1880 and 1892 wrote the graceful and academic essays which are gathered together in the four volumes of *La vie littéraire* (1888-92). His critical attitude has been termed one of Pyrrhonism; a skeptic, an eternal doubter, he declared himself a "son of the eighteenth century" opposing with pessimistic irony both the Catholic royalism of Brunetière and the sociological positivism of Zola. Turning, toward fifty, to prose fiction he continued to direct his scorn, although always indulgent and light of touch, at all institutions and parties. His novels, discursive and pleasantly sparkling, were when they were not works of fancy chiefly autobiographical vehicles whose characters were the mouthpieces for the author's opinions. Speaking now as the abbé Coignard and now as M. Bergeret, France attacked the Catholic church and the army, but also the more democratic movements including the French Revolution. The upshot of this phase of his social thinking was that man "is naturally a very wicked animal" ruled only by force and that all proposed changes of social institutions are consequently "futile."

During the turbulent days of the Dreyfus case, however, Anatole France underwent a notable conversion. He became acutely conscious of the error or political crime which government and army sought to defend. He saw the issue as extending beyond race feeling and he joined Zola and the other "Dreyfusards" in the fight of "socialism and freedom of thought" against "Catholic theocracy and bourgeois authoritarians," becoming finally a member of the Socialist party. His later writings were deeply colored by this change of attitude. *L'affaire Crainquebille* (1901) was a moving study of social injustice. The brilliant allegory of *L'île des pénguins* (1908) contained a satirical summation of human history with its endless cycles of wholesale murder and theft, culminating in a

thin disguise of the Dreyfus case. It is significant that the great crisis in the affairs of the penguins is shown as the outcome of their institutional set up.

France's social tracts possessed eloquence and worldly wisdom rather than originality. Typical are the speeches and papers collected in *Vers les temps meilleurs* (1906), and the *L'église et la république* (1904) written during the agitation over the new anticlerical laws. His beliefs seemed to issue from the complex needs of his temperament rather than from a well integrated social philosophy. His attitude during the World War, for example, was at first one of intense patriotism, then of disillusionment and finally, just before his death, of espousal of Russian communism. He was at heart a skeptic and a diletante, whose passion for individual freedom threw him upon the popular side. He loved to dwell chiefly upon human foibles, as did his favorite masters Rabelais and Montaigne; in doing this he employed his wit and his lucid style with telling effect upon the various social emergencies of his time.

FRANCIA, JOSÉ GASPAR RODRIGUEZ (1766-1840), Paraguayan statesman. Francia studied at the University of Córdoba del Tucumán, where he received the degree of doctor of theology in 1785. After a short career as professor of theology he turned to the practise of law.

Francis stood out as a political personality from the very beginning of the struggle for an independent Paraguay. He was a member of the junta which acquired control of the country when Paraguay declared its independence in 1811, and two years later he became one of the two consuls at the head of the newly organized

consular government. His great prestige, due to his integrity and culture, now increased rapidly. In 1814 he was placed at the head of a dictatorship established for the purpose of protecting Paraguay from the imperialistic ambitions of the neighboring countries; soon afterward he was made dictator for life. His regime was an era of paternal absolutism. He controlled the entire government and energetically crushed all the attempted rebellions fostered by the foreign enemies of Paraguay—a task made easier by the fact that the population, trained in the severe discipline of the missions, was accustomed to obey.

Historians' judgments of his achievements have varied widely. It cannot be denied, however, that at a crucial period in the history of Paraguay he succeeded in maintaining its independence against the imperialism of Buenos Aires and Brazil. To achieve his purpose he imposed upon the country a policy of political and economic isolation which went to the extent of prohibiting emigration. His economic program was important in that it brought about a fuller exploitation of the soil, an increase in cattle raising and a diversification of industry in order to supply the home market. During his regime great importance was attached to education. Nevertheless, under his rule Paraguay lost contact with the rest of the world and entered on a period of stagnation.

FRANCIS JOSEPH I (1830-1916), emperor of Austria and king of Hungary. Francis Joseph was, as he called himself, the last monarch of the old school. With the exception of the last few years, when his forces were already waning, he exercised more personal power in the domestic and foreign policy of his empire than any other monarch in recent times. In spite of his well developed sense of duty and extreme bureaucratic diligence his mental gifts were not equal to the enormous task of maintaining the social and political equilibrium of fifty-two million people divided among a dozen nationalities, most of which had irredentist tendencies. The old conception of the empire as a family fideicommissum of the Hapsburgs continued almost unaltered until the end in spite of certain constitutional forms. During the seven decades of his long rule there was no real constructive policy

either in the field of the agrarian problems or in that of the nationality struggles, although these were two major issues which ultimately deadlocked the very mechanism of the state and accelerated the clash with the absolutism of Russia. The gravity of the southern Slav problem became especially acute after the frivolous occupation in 1878 of Bosnia and Herzegovina and the creation of the Albanian buffer state. Four different socio-political systems may be distinguished in Francis Joseph's governmental methods. The first period was the bloody suppression of the achievements of the Revolution of 1848 and the restoration of the mediaeval autocracy in a close alliance with the pope in the Concordat of 1855. The second period was an experiment with constitutionalism when in 1859 Austria was badly defeated on the Italian battlefields. In 1860 the emperor issued the so-called October diploma, which meant a rupture with the Germanizing centralism and an essay to gain the more active cooperation of the feudal nobility. The resistance of Hungary, however, brought about in a few months an entirely new course with the so-called February patent, signifying the continuation of the German bureaucratic centralization, combined with the curia system, which gave a certain participation in power to the landed estates and the bourgeoisie of the cities. This system, appropriately called "provincial diets, strengthened by a few attorneys and manufacturers," lasted until the introduction of the third system, the dualistic constitution established in 1867 as a result of the defeat of the Austrian army by the Prussians. On the basis of a very artificial electoral law this system gave the leadership in Austria to the German bourgeoisie and bureaucracy and in Hungary to the feudal nobility. In this way two privileged nations were created, with whom two minor partners participated in the form of a broader territorial autonomy: the Croats in Croatia and the Poles in Galicia. But dualism led more and more to pan-Slavic currents whose danger was enhanced by the irredentism of the Italians and the Rumanians. Even the privileged nations became passionate enemies in the long run and the more clear sighted statesmen of the monarchy convinced the emperor of the necessity for remolding the constitution. In this fourth period Francis Joseph in spite of his rigidly militaristic and aristocratic personality became the protagonist of universal suffrage (*Burgsozialismus*) as a result of his conflict with the Magyar oligarchy. Universal suffrage was attained in

Austria in 1907, but the crisis became even more acute due to the antagonism between the popular parliament in Austria and the feudal one in Hungary. In this way the conviction of the emperor, "this realm cannot be ruled constitutionally," was justified by the last events of his empire, disintegrating because there was no place for the growing national consciousness of its various peoples. Thus the personal tragedy of Francis Joseph's life—his wife had been murdered, his brother executed, and his son had committed suicide—became more pathetic with the final collapse of his empire.

FRANCIS XAVIER (1506-52), Christian missionary to India and the Far East. Francis Xavier was born in Navarre of mixed Basque and Spanish blood. He was a student of arts and theology at the University of Paris for about twelve years and while there, in 1534, he became a member of the original group under the leadership of Ignatius Loyola which founded the Society of Jesus. From 1536 to 1540 he remained in Italy as secretary to the society while it was taking shape and winning the approval of Pope Paul III. In 1540 at Loyola's direction and in response to a request from John III, king of Portugal, Francis Xavier left Rome and reached Goa in 1542 to inaugurate the Jesuit mission in the new Portuguese possessions in the East. The remaining ten years of his life were spent in almost incessant religious work and travel. In Goa, among the newly converted Paravas, or pearl fishermen, of the south coast of India, at Malacca, in the East Indies and again in India he sought to raise the moral level of the Christians, to win new groups of adherents to his faith and to lay the foundations of the future missionary activities of the Jesuits. During his sojourn in Japan from 1549 to 1551 he founded a Christian mission which was soon to achieve great popularity and the reaction from which was to be the chief factor in closing Japan to the foreigner in the seventeenth century. He also became the forerunner of modern Christian enterprise in China and died during an attempt to reopen Christian

missions from an island off the south coast. His unwavering devotion, extraordinary endurance and proselytizing fervor had a profound effect in molding the activities of succeeding generations of Christians in their culture contacts with the East.

FRANCISCAN MOVEMENT. The Franciscan movement was an attempt at social and religious reformation emanating from the Franciscan order and producing its most significant effect during the thirteenth and fourteenth centuries. Its inception coincided with a period of widespread popular dissatisfaction with the Roman church, a dissatisfaction caused in large part by the inadaptability of contemporary Christian institutions to the kaleidoscopic social changes of the time. While the rapid breakdown of the feudal system, the rise of the towns and the sudden fluidity of populations were multiplying social needs and making almost unprecedented demands upon the church, the secular clergy, lying in a torpor of moral and intellectual degeneracy, remained indifferent. Monasticism by its very ideal of seclusion from the cares of ordinary life was barred from mediating between the church and the people. Both secular clergy and monasteries had fallen under the sway of a rigid aristocratic tradition: the potentates of their hierarchies received appointment, in the majority of cases, by virtue of birth or station and ruled with unqualified absolutism. To the natural disaffection of the numerous clerical proletariat crushed beneath this structure was added that of the lay proletariat in the towns, where the consciousness of recently acquired freedom was engendering an incipient democratic spirit. The reaction gathered immense strength with the rise of the new commerce and economic standards which came in the wake of the crusades. As the church maintained a sympathetic silence before this threat to its traditional teachings and as the Roman Curia, at first surreptitiously, then openly, began to traffic with the bankers, the conviction rapidly grew that the current institutions for the transmission of Christ's precepts were outworn. In the last decade of the twelfth century Joachim of Flora preached the imminent approach of a new age, that of the Eternal Gospel, in which the church militant, having

outlived its function, would yield to the reign of the Holy Ghost. The profound impression created by his apocalyptic visions as they reverberated through France and Italy is indicative of the restless, expectant temper of the time. What Joachim did was to sanctify by a philosophy of history a return to the Gospels already begun by sporadic lay movements in search of an authority for their aversion to ecclesiastical wealth and luxury. At the turn of the thirteenth century Italy and France were overrun by a number of sects or confraternities—the Waldenses, the Humiliati of Milan—all professing and practising the doctrine that Christ enjoined complete renunciation of property upon the adherents of His religion.

While these diverse currents helped prepare the age for the Franciscan movement, there is no evidence that its founder, St. Francis (1182–1226), was more than vaguely aware of any of them. St. Francis has been called the “most spontaneous and unconventional genius of many ages.” The town of Assisi, where he was born into the family of the rich merchant Pietro Bernardone, had early reaped its share of advantage from the revival of trade. During his early youth Francis’ romantic, sensitive nature found ample gratification in the life of an indulged scion of wealth and of a popular leader of festive exploits. His year’s captivity in 1203–04, as a result of a war between Perugia and Assisi, and his subsequent illness mark the beginnings of one of the great mystical conversions of the world, a conversion as inexplicable in its essence as that on the road to Damascus. But portents of Francis’ future mission came slowly. When *La donna povertà* appeared in a vision, his troubadour’s heart vowed fidelity. In the transitional period of conscious self-immolation he journeyed to Rome, begged at the gate of St. Peter and upon his return mingled with the lepers. He began to frequent in solitude the ruined churches and grottoes about Assisi. In the little church of San Damiano, the crucifix spoke to him, “Go repair my church.” He responded with characteristic literal obedience, and in Assisi his mason’s work may still be seen. Before long, flinging his garments at the feet of his angry and disappointed father, he severed the last ties of the past. Probably in 1209 while listening to the mass in the miniature chapel of the Portiuncula he heard the verses from *St. Matthew* x: 7–10 which gave him his definitive commission: “And as ye go, preach, saying, The kingdom of heaven is at hand. Heal the sick, cleanse the lepers, raise the dead, cast

out devils; freely ye have received, freely give. Provide neither gold, nor silver, nor brass in your purses; nor scrip for your journey, neither two coats, neither shoes, nor yet staves; for the workman is worthy of his meat." Upon the apostolic commission Francis founded his life. He began to preach among the people and disciples flocked to him—nobles, plowmen, professional men, representatives of all classes willingly submissive to the spell of Francis' passionate conviction. The profound humility which accompanied his conversion prompted him to seek forthwith the sanction of the Holy See; in 1210 he received at Rome Innocent III's oral approval of an order founded on rules no more definite than the simple passage from *St. Matthew*. But in its very lack of organization the primitive Franciscan order dissolved the protest against the aristocratic and parasitical tendencies of the church. It had neither hierarchy, nor at first even novitiate; its purpose was not detachment from society, but unwearied absorption in alleviating the misery of the distressed; it imposed absolute poverty not only upon individual members but, in contrast with the monastic rule, upon the order as a corporate institution. Means of sustenance came as voluntary contributions from the recipients of its services; when these were withheld, the Franciscan might beg, "for the workman is worthy of his meat."

By the end of the first decade of Francis' apostolate, the order already numbered several thousand brothers, drawn chiefly from Italy and southern France. Although this spontaneous growth can be explained in part as the expression of the current revolt, it represents still more the popular response to a movement transcending the limitations of mere protest. Francis rediscovered the Christian religion as an individual experience in which all might participate. Whatever social or political implications that religion held he transmitted to the masses, not as theories or as corollaries or even as duties, but as means to the attainment of the final individual joy, the true imitation of Christ. Thus poverty became for Francis a treasure rather than a renunciation, the indispensable prerequisite for freedom from the inconsequential and the vilifying. "If we had property," he once said, "we should need arms to defend ourselves, for thence arise disputes and lawsuits, wherefore . . . we be minded to possess naught of worldly goods." In extracting the promised reward of the Christian life from the empyrean heights to which it had been elevated by the gradual evolution of Catholic dogma

Francis spread a message as unformalized, as individual and at the same time as universal as that of the primitive Christian apostle. This message he uttered in the market place; before the sultan, whom he visited in 1219; as the legend relates, to Frederick II, the Holy Roman emperor. The number of his professed followers, magical as was its growth, gives but partial indication of the effect of his work. Not the least important element in his almost unparalleled influence in erasing the stigma from poverty was the poetic halo with which, by the example of his own life, he was able to surround the life of the poor. The figure of the Poverello drawn by mystical love into intimate communion with "Brother Sun" and "Brother Fire" made his age aware of the long buried beauties of nature and of the idyllic splendor of the simple life; and the saint who had once loved the troubadours brought the romance of chivalry to the masses in his following, whom he called the minstrels of the Lord. Turning his eyes toward the reorientation and reform of the individual, Francis had no thought of destroying existing institutions. The democracy which he represented could not be attained by depriving others of privilege: peace was its condition. "We are sent to succor the clergy for the salvation of souls," quotes Francis' first biographer, Brother Leo, in the *Mirror of Perfection*; ". . . cover their slips, and supply their many defects, and when ye have done this be ye therefore yourselves the more humble."

The church on its side perceived the advantage of sponsoring a movement which, while offering no threat to the ecclesiastical structure, was at the same time capable of producing religious regeneration, of arresting social and political dissension and of shouldering the formidable burden of Christian charity. Chiefly through the initiative of Cardinal Ugolino of Ostia (later Gregory IX) and Popes Innocent III and Honorius III the order began to be subjected, very early in its history, to a process of systematic adaptation to the needs of the church. Their task was facilitated by Francis' lack of concern with matters of law and organization. As the natural consequences of growth made it imperative that the amorphous Franciscan order be provided with definite administrative machinery, control gradually passed to more practical men like Peter da Cataneo, to whom in 1220 Francis humbly relinquished his official leadership, and Brother Elias, who succeeded Peter the following year. Meanwhile the example of the Dominicans,

founded in 1216 for the purpose of preaching the orthodox creed among the heretics, had given the church the embryonic model of a highly organized order of friars, combining mobility with centralized control. Deviation from the original system of government, according to which the rules and decisions were made by annual popular chapters attended by all the brothers on the principle of pure democracy, began as early as 1221. By the definitive constitution the chapters consisted of provincial ministers, each with his *socius*, one *custos* elected from each custody (division within the province) and one *discretus* elected by the provincial chapters. In its solicitude to render the order powerful and influential, the church, conjointly with Brother Elias and later minister generals, progressively attenuated the mandate of absolute poverty by a series of tortuous compromises. Two new rules supplanted the simple formula of 1209: the first in 1221; the second, for which Ugolino was probably largely responsible, in 1223. The omission from these rules of the Gospel precept to take nothing by the way and of the severe injunction to labor agonized Francis, and shortly before his death in 1226 he composed the famous Testament enjoining upon his followers the strict observance of the primitive rule. But the process of institutionalization went on and with it the inevitable adulteration of Francis' principles. Before Francis' death the order had already assumed international proportions, with chapters in France, Germany, Hungary and England. Within less than half a century it was to reckon thirty-four provinces, seventeen Cisalpine and seventeen Transalpine; and a membership of over 200,000, a figure never before equaled by any order in the history of the church. In recognition of the earthly needs of this great and growing body, Ugolino (now pope) in 1230 officially dispensed the order from St. Francis' embarrassing will, confirming the rule of 1223 and creating a new avenue for evasion by the decree that the friars, although forbidden corporate property, might nevertheless receive gifts through trustees. Fifteen years later Innocent IV provided that friars might have recourse to money—the thing which Francis “did above all execrate”—not only for necessities but for convenience; and that they might assume the virtual ownership of houses and land by formally vesting their titles in the Holy See. The full extent of the order's divergence from its founder was indicated when the chapter of 1266 authorized the destruction of all previous Franciscan litera-

ture and constituted as the official legend of the saint the one which St. Bonaventura completed in that year.

The compromise of Francis' precept of poverty was not accomplished without a struggle. The internal history of the Franciscan order is one of a continuous effort, constantly thwarted but never abandoned, on the part of certain groups to retain intact the standard of absolute poverty bequeathed by St. Francis. Fluid factions roused to spasmodic outbursts of fervor under the influence of a series of great leaders, these groups came to be called Spirituals or Zealots, in contrast with the Moderates, who after the expulsion of John of Parma from the generalate in 1257 were always dominant. Through the Spirituals the mystical, apocalyptic elements in primitive Franciscanism were kept alive. During the thirteenth century they welded the Franciscan tradition with Joachism and, undaunted by a contradictory reality, proclaimed that St. Francis had initiated the age of the Eternal Gospel—the age of the spirit and of freedom, the age without class or social distinction, without property. Although the reflection of their ideals was caught and retained in a distorted form by the Moderates, the inevitable tendency of the Spirituals was to destroy themselves by battering against institutions which were stronger because they were more practical. The first open breach between the two factions came after the death of St. Bonaventura in 1274, and a number of great Zealots were brought to the front: Angelo da Clareno, Ubertino da Casale, Pierre Jean Olivi of Provence. But in Provence the insurgents succumbed in 1318 and subsequently in the fire of the Inquisition; in Italy the bull *Sancta romana* suppressed Angelo's followers about the same time, driving them into a sterile isolation from society which in reality directly contravened the spirit of St. Francis' reform. The tangible impact of Franciscanism on the thirteenth and fourteenth centuries is to be discovered not in the controversies of the Zealots but in the work of those friars who remained sufficiently unpreoccupied with the rigid enforcement of an ideal at cross purposes with civilization to mingle with the world and take their part in the concerns of secular life.

Francis Thompson's characterization of the Franciscans as the Salvation Army of the Middle Ages is not without significance. Throughout the entire history of the movement one distinguishing quality dependent upon the example and precepts of the founder retained its vitality. The

Franciscans were preeminently the apostles of the masses and in particular of the urban masses. They founded hospitals and leper houses; they introduced works of public utility, such as water supplies. The persistence of the original impulse to relief work in the towns is indicated as late as the fifteenth and sixteenth centuries when the order participated in the establishment of the *montes pietatis*, or municipal loan institutions of Italy. While these institutions implicitly clashed not only with St. Francis' prohibition of money but with the traditional teachings on interest, their functional importance in relieving the financial straits of the needy won the sympathy of the Franciscans, who became their principal protagonists against the more orthodox and, at least in this case, more doctrinaire Dominicans. Many historians have also attached great weight to the significance of the Third Order of St. Francis in the growth of the towns. Probably owing its constitution largely to Ugolino, this order had been established before Francis' death to supplement the First Order, to which men professing the absolute poverty of Francis were eligible, and the Second Order, or Order of St. Clare, which recruited women on the same basis. It was a brotherhood of laymen released from any mandate of poverty, either personal or corporate, but enjoined to live lives of simplicity and Christian charity. Their obligations included abstention from oaths and from the use of arms. Since oath taking and military service were essential elements in the feudal system, the inference seems logically just that the Third Order contributed to the breakdown of that system and gave corresponding impetus to the growth of the communes. But in reality the history of the Third Order is enshrouded in mystery and it is difficult to judge to what extent it performed functions distinct from those of the other religious guilds which seem to have been rife in most centers of industry at the time. Its territorial and numerical extent cannot be fixed even approximately, although it is known to have flourished in the towns of Umbria and Tuscany and in the Rhenish cities.

In certain spheres the influence of the Franciscans coalesced with that of the Dominicans. No less than the Black Friars the Grey Friars were the confessors of kings and still more the confessors of queens; no less than the Black Friars they helped, by the example of their own representative constitution, to propagate the idea of representative government in affairs of state. But perhaps their influence is least distinct from

that of the Dominican in the realm of education. St. Francis had looked upon learning as anti-pathetic to the true imitation of the lowly Christ, but by the latter half of the thirteenth century the Franciscan order had come to represent a Christian utopia for some of the finest minds of the time, and St. Bonaventura, the "Seraphic Doctor," who was minister general from 1257 to 1274, could declare: "I confess before God that it is this which has made me most of all to love the life of St. Francis, that it is like the beginning and the consummation of the church, which first began from simple fishermen and then advanced to the most famous and most learned doctors." Adam Marsh, Alexander of Hales, Roger Bacon, Duns Scotus and William of Ockham were Franciscans. Under the influence of the intellectuals within the order and of the Dominican example the Franciscans perfected an elaborate educational organization, including advanced schools in the university towns—Oxford, Paris, Cambridge and Bologna—and subsidiary schools located in their priories. Like those of the Dominicans these institutions were flung open to the public, and particularly during the thirteenth century won such prestige that they exercised a virtual monopoly of general education.

But the Franciscans struck deeper than the superstratum of culture—philosophy, science, educational organization. Francis, embodying in his own life the deep poetry of the Gospels, adding to the religious inspiration an extraordinary sensitivity to natural beauty and a superlative capacity for seizing upon the concrete image, has been generally accepted, especially through his *Canticle of the Sun*, as the creator of the vernacular religious poetry of Italy; and the impulse which moved him extended to a long line of Franciscan poets, of whom the best known are perhaps Jacopone da Todi and Thomas of Celano. It was through St. Francis that Cimabue and Giotto and through them that the nascent Florentine school of painters learned the deep poetic significance of Christianity; while the tomb of the Poverello at Assisi—a monument, like so many of the works of his followers, built in exact contradiction to his ideals and yet testifying to the vitality of those ideals—became the model of a new architecture in Italy. Of more direct social significance were the contributions made by the Franciscans to the cultural life of the masses in the towns. Traveling swiftly from place to place, cosmopolitan in their outlook, they ranked with the

merchants as disseminators of information, discoveries, alien customs and standards of life. Freed, unlike the merchants, from the eager quest of personal gain, having the inestimable advantage of the religious *entrée* in an age when all culture was still widely regarded as a kind of Plotinian emanation from Christianity, their influence was correspondingly more universal and more popular. It was the friars who developed the art of popular preaching, and whereas the Dominicans concentrated on matters of faith and dogma the sermons of the Franciscans were chiefly occupied with the details of daily life—with morals, the obligations of Christian charity and even matters of dress. A picture of thirteenth century German life might be drawn from the sermons of Berthold of Ratisbon. In the early history of miracle plays the name of the order constantly reappears, and their continued interest in the popular drama is manifested as late as the sixteenth century when they became the sole directors and organizers of the Coventry plays.

The Franciscans made various attempts to elaborate the economic aspects of St. Francis' way of life into a body of formal speculation. When compared with the contemporary work of the great Dominican Aquinas, who was attempting to bridge the gap between the traditional doctrines inherited from the church fathers and the new conditions precipitated by the revival of commerce, their highly idealistic and ethical system left little impress on the main currents of thought of the time. Some, like Anthony of Padua, were carried by their zeal into vehement condemnation of all money or material rewards considered as *quid pro quo* for economic activity and came to regard all who enjoyed the goods of this world as belonging to the devil. Systematic thinkers like Alexander of Hales and St. Bonaventura approached more closely the church fathers, and while assuming that property was a consequence of sin emphasized the Christian duty of redistributing surpluses among the poor. The most distinctive characteristic which pervades Franciscan economic speculation as a whole is its justification of mendicancy. Even St. Bonaventura, who clearly perceived the dangers of the practise and who declared during his generalate, "It has come to this, that the wayfarer fears to meet a friar as he fears a robber," could not escape the conclusion that economic industry was the virtue of the godless and that man was justified in begging when work interfered with his pursuit of Christian per-

fection. The Franciscan who combined in greatest degree a capacity for systematic thought with unwavering fidelity to the idea of evangelical poverty was the Zealot Pierre Jean Olivi, who developed the doctrine of the "poor use" and whose speculations on egoism strongly suggest Tolstoy. The doctrine, ending in the dictum that not only economic activity but any endeavor which brought satisfaction to the ego was sin, would have condoned no life but that of the man bereft of possessions and surviving by partaking of the bounty of the Lord. All these thinkers were in varying degrees guilty of distorting Francis' simple, unformalized views on begging. To him begging was no more than the substitute device which God provided when the brethren could not work. But his followers elevated this device into a rational principle and fortified it by elaborate logic; in so doing they provided a much exploited refuge for the host of idlers who were to help destroy the influence of the order.

The principal political connotation of the Franciscan movement was one which the age was hardly prepared to develop into a body of formal doctrine. That democratic spirit which the movement released in the masses everywhere—the vivid sense of human equality and of the significance of the individual—necessarily remained an intangible force affecting the outlook of men but debarred from integral expression. Nevertheless, in the history of Catholic absolutism the Franciscan movement stands as the first powerful assertion of the rights of the individual against church authoritarianism in the long series of explosions which led to the final culmination of the Reformation. The heretical basis on which the Franciscans had been founded remained for more than a century merely implicit. But when in 1323 John XXII sought to demolish that basis by officially pronouncing the doctrine of evangelical poverty to be heresy, the order, precipitately abandoning its policy of submission to compromise and subterfuge, united in self-assertion and presented the spectacle of a recognized institution of the church flinging back at the pope his own anathema—heretic. It was this controversy which inspired the political writings of the famous Franciscan William of Ockham in which he developed his theory of the limitation of the powers of the papacy through the church body, thereby joining Marsiglio of Padua in laying the foundations for modern theories of sovereignty.

The Franciscan revolt against John was the

flare of a spirit which had already lost much of its power to translate itself into reality. Decline was rapid during the fourteenth century, accelerated by external conditions, such as the Black Death, during which over 100,000 Franciscans lost their lives, but due still more to the gradual moral corruption of the friars themselves. In England, Chaucer, Gower, the author of *Piers the Plowman*, Wycliffe and the Lollards castigated their vices: their idleness, their ubiquitous begging, their hypocrisy; and on the continent there is the same abundant evidence of the withdrawal of public approval. Internal schisms, periodic reforms and attempts to recapture the primitive spirit of the order continued down to the Reformation. During the fourteenth century a line began to be drawn between the Observants, who under Bernardino of Siena became for a time the most vital religious force in Italy, and their laxer brethren the Conventionals. In the face of repeated failures to reconcile the two groups, the church separated them in 1517 into independent organizations; since that time the Observants have been by far the more numerous of the two. In the succeeding years the Observants were in their turn confronted with a rapid succession of schismatic reformers, of whom the most important were the Capuchins. But by the same token that each successive reform made for increased severity of discipline, it made for increased isolation. Since the fourteenth century the history of the Franciscans has been that of an order progressively losing contact with secular life, retreating from the apostolic ideal of service in the world and ending in virtual conformity to the old monastic pattern. After that century its membership dwindled to a fraction of the enormous figure it reckoned at its height. Nevertheless, down to the present time it has, in general, attracted more recruits than any other religious order of the church; and it has remained pre-eminently the order of the poor.

FRANCK, SEBASTIAN (1499-1543), German mystic. At first a Catholic priest, then a Lutheran preacher, Franck renounced all formal religion in 1528 and spent the remaining fifteen years of his restless life as a writer and printer. His aversion to organized churches is explained by his conviction that only the "invisible word," the "spirit of God," can give power and light to man. It was to the "invisible spiritual church" that Franck aspired in his intense individualism. By virtue of his uncompromising demands for freedom of conscience Franck is to be regarded as one of the first champions of the idea of tolerance. But to exalt him into a path breaker for the modern era, as many scholars have done, is to overrate him. The otherworldly and mystical set of his mind prevented him from attaining

to any positive view of the concrete realities of life or from formulating a definite social program. Although he did in passing recommend community of goods, fundamentally he was indifferent to the needs of the masses and even acquiesced in the smothering of such movements as the Peasants' Revolt of 1524-25. On the other hand, he was as antagonistic to imperial authority as to democracy. The most that can be said is that the critical attitude toward the social institutions and spiritual tendencies of his time which Franck expressed in his writings, especially the *Chronica*, *Zeitbuch und Geschichtsbibel* (Strasbourg 1531), with its supplement *Weltbuch* (Tübingen 1534), and the *Paradoxa* (Ulm 1534; new ed. by H. Ziegler, Jean 1909), helped to pave the way for the *Aufklärung*. In the section of the *Chronica* known as the *Ketzerkronik* is contained the essence of Franck's philosophy of history, that the heretics of every age have been Christs.

Jahrhundert* (Berlin 1921); Oncken, H., "Sebastian Franck als Historiker" in *Historische Zeitschrift*, n.s., vol. xlv (1899) 385-435; Stadelmann, Rudolf, *Vom Geist des ausgehenden Mittelalters, Studien zur Geschichte der Weltanschauung von Nicolaus Cusanus bis Sebastian Franck*, Deutsche Vierteljahrsschrift für Literaturwissenschaft und Geistesgeschichte, vol. xv (Halle 1929).

FRANCKE, AUGUST HERMANN (1663-1727), German religious leader and educator. Francke, with Philipp Jakob Spener, was the foremost leader of the German religious awakening known as Pietism. While Spener may be considered the theorist of the movement, it was Francke with his tremendous energy and remarkable powers of organization who brought into being a host of institutions that gave concrete expression to the Pietist ideals of living faith and practical piety. In 1692 Francke came as preacher to Glaucha, at that time a poor suburb of Halle, and a few years later became associated with the newly founded University of Halle. His interest in the welfare of the lower classes as well as in general educational improvement led him to the organization of a group of institutions which comprised a charity school, an orphan asylum, a *Pädagogium* for wealthier pupils, a German school, a Latin school and a *Gynæceum* for the education of girls. At the time of his death these institutions had 2200 pupils with 171 teachers and eight inspectors.

Francke was the first to direct the attention of philanthropic workers to the need for providing for the educational as well as for the physical welfare of the poor, and schools patterned after his model were established in various parts of Germany. His primary educational aim was religious and in this connection he was the first to emphasize the principle of the education of the will, but he also pointed out the importance of the need for training better and more useful citizens for the state. The example of his schools as well as the activities of his pupils and disciples thus had a marked influence on the subsequent organization of the Prussian public school system under Frederick William I and Frederick II. His influence was also significant in the *Real-schulen* movement started by his disciple Hecker; through his *seminarium praeceptorum* and his *seminarium selectum praeceptorum* he may be considered the founder of teachers' training schools. The Franckische Stiftungen, the outgrowth of the organizations started by Francke, still occupy a prominent place among German educational institutions and form in themselves almost a suburb of the city of Halle.

Consult: Kramer, Gustav, *August Hermann Francke*, 2 vols. (Halle 1880-82); Otto, August, *August Hermann Francke*, Die pädagogischen Klassiker, vols. ix-x, 2 vols. (Halle 1902-04); *Geschichte der Erziehung*, ed. by K. A. Schmid, 5 vols. (Stuttgart 1884-1902) vol. iv, pt. i, p. 187-302; Sommer, Feodor, *August Hermann Francke und seine Stiftungen* (Halle 1927); Weiske, Karl, *August Hermann Franckes Pädagogik* (Halle 1927), and *August Hermann Francke, der deutschen Seelsorger* (Halle 1927).

FRANCKE, ERNST (1852-1921), German journalist and social reformer. After studying philosophy, natural science and economics in Strasbourg, Göttingen and Leipzig, Francke went to St. Petersburg in 1876 as a private tutor. In 1877 he began a journalistic apprenticeship in Nuremberg as editor of the *Fränkischer Kurier*, at that time a liberal democratic paper. Four years later he became editor in chief of the *Münchener neueste Nachrichten* and in twelve years made it a leading daily. He was publisher of the weekly *Soziale Praxis* from 1897 to 1921, general secretary from 1901 to 1913 and later president of the Gesellschaft für Soziale Reform and a member of the provisional federal economic council from 1920 to 1921. Francke's achievements were seldom original, yet they were creative. Through his well informed and lucid writings he greatly influenced German

pre-war social politics, and his practical wisdom enabled him to find common ground for the administrative officials and labor leaders. In the society for social reform, a forum for the discussion of socio-political problems, Francke gained the confidence of the labor unions and often succeeded in prompting social reformers and labor leaders of different political tendencies to common action. With the exception of a few leaders of industry like Albert Ballin, Wilhelm Merton, Richard Roesike and Franz Brandts employers distrusted Francke until the revolution, but he was supported by such scholars as Brentano, Sombart and Schmoller. Francke made the *Sociale Praxis* unique; in this organ all tendencies were allowed free expression, although the editor held the journal fundamentally to a consistent attitude on social reform. He worked successfully in the international field; the International Union for Protective Labor Legislation and the post-war International Labour Organization were results of his efforts. In all his fields of work he had the close confidence of the former Prussian minister of trade, Baron von Berlepsch. His great achievement was no single work, whether book or institution, but lay in the fact that he was confidant and mediator to forces that could not find a way in imperial Germany to practical cooperation for social reform.

LUDWIG HEYDE

FRANK, JOHANN PETER (1745-1821), Austrian physician and writer on public hygiene. Frank, who was a professor of medicine and director of hospitals at Pavia and at Vienna, is best known for his *System einer vollständigen medicinischen Polizey* (4 vols., Mannheim 1777-88). In it he offered the first system of public hygiene by a German speaking physician which discussed comprehensively the mutual responsibilities of the state and the individual in reference to health. Frank formulated a program for the care of the individual from before birth to death. He recommended that the physical condition of women at marriageable age be guarded, discussed marriage as an institution and proposed a tax on bachelors to discourage celibacy. When dealing with the care of the pregnant woman he warned against the harm resulting from overindulgence in alcohol. In his treatment of the care and instruction of children in the first seven years of life he emphasized the value

of a varied diet and proper exercise. He considered the education of youth by the state, pointing out the need of well lighted and properly ventilated school buildings with good benches and the value of supervised exercise and frequent bathing. He recommended the teaching of sex hygiene and of human anatomy and saw the necessity for proper entertainment. In his community program he advocated that the state supervise the construction of dwelling houses, provide good water supplies, dispose of filth, accomplish civic cleanliness by a corps of medical police, shelter the aged and supervise burial. If public health practises resulting from modern knowledge of the infectious diseases and immunology be added, the program of public hygiene which Frank outlined might serve with few changes today.

W. W. FORD

Consult: Frank's autobiography, *Biographie des D. Johann Peter Frank* (Vienna 1802); Seiler, Hugo, *Peter Frank* (Dresden 1895); Doll, K., in *Naturwissenschaftlicher Verein, Karlsruhe, Verhandlungen*, vol. xxii (1908-09) 3-85.

FRANK, LUDWIG (1874-1914), German socialist politician. Frank was born in Baden of Jewish parentage. Early in his career he became a member of the radical wing of the Social Democratic party. In 1904 he started a socialist youth movement. As a member of the Baden Landtag and later in the Reichstag he swung his party to opportunist tactics aimed at democratization. He became the soul of the so-called great Left block of Baden, in which the Social Democratic party allied with the liberals went so far as to approve the budget of the grand duke's government. Despite opposition in his party, especially from the older elements, he sought to repeat these tactics in imperial politics. In his fight against the plutocratic Prussian three-class franchise he attempted to win the Social Democrats in the Reichstag to active cooperation. To win Alsace-Lorraine for Germany and wipe out the menace of a French war of revenge he induced the imperial government to grant universal suffrage to these provinces in 1911. When all south Germany had universal suffrage, he argued, it could not long be withheld from Prussia and the victory of democracy there would, he hoped, make certain European peace. He had long been in friendly contact with the French Social Democracy and was with Jaurès the instigator and leader of the socialist peace demonstrations in Berne at Easter, 1913, and in Basel

at Easter, 1914. When neither the democratization of Prussia nor the clearing of the European horizon seemed to be imminent, he finally favored pressure upon the Prussian government by means of a political general strike. When the World War, the prevention of which he had looked upon as his life task, broke out he entered the army as a volunteer. A week before a French bullet ended his life in Lorraine he explained his action on the ground that "the international ideal will still, for a long time, be kept in the background by the reality of a national labor movement. Instead of a general strike, we are waging a war for the Prussian franchise." With the death of Frank the German Social Democratic party lost the most statesmanlike personality of the younger generation.

GUSTAV MAYER

Consult: Frank, L., *Aufsätze, Reden und Briefe*, ed. by H. Wachenheim (Berlin 1924).

FRANKEL, LEÓ (1844-96), Hungarian Jewish socialist. At the age of twenty he emigrated to Germany, where he earned his livelihood as a goldsmith and became a socialist. In 1867 he settled in France. There he took a prominent part in organizing the Lyons section of the First International. He was sentenced to two months in prison during the Franco-Prussian War and was liberated on the downfall of Napoleon III. At the organization of the Commune of Paris he was elected to the Central Committee and the Labor Committee (*délégué au travail*), where he was active especially in reorganizing abandoned industrial plants. He was responsible for the ordinance of May 3, 1871, against night work in bakeries, the first instance of such a measure. On the fall of the commune he escaped to London, where he acted as Austrian secretary of the International. From 1876 to 1883 he was in Hungary editing a socialist weekly, the *Arbeiter-Wochenchronik*, and was the first real organizer of the Hungarian General Labor party, a socialist movement. He was jailed by the Vienna and Budapest police for his participation in the Paris Commune, although the French government had not brought legal action against him. While representing Hungary at the Socialist Congress in Ghent in 1877 he was ordered out of Belgium. He passed most of his remaining years in Paris. Frankel was a friend and staunch follower of Marx and in 1889 was a member of the presidium of the Paris socialist conference which led to the establishment of the Second International. He was a gifted speaker, a good organ-

izer and a lively journalist, contributing numerous articles on practical questions to such journals as the *Neue Zeit*, *Gleichheit*, *Bataille*, *Ère nouvelle* and the *Jahrbuch für Sozialwissenschaft und Sozialpolitik*.

Consult: Rezső Krajcsi, *Frankel Leó, a párizsi kommun magyar vezére* (Budapest 1919); Brügel, Ludwig, *Geschichte der österreichischen Sozialdemokratie*, 5 vols. (Vienna 1922-25); Mason, Edward S., *The Paris Commune* (New York 1930).

FRANKEL, ZECHARIAS (1801-75), German-Jewish religious leader and scholar. Born in the old ghetto of Prague, Frankel obtained a thorough Hebrew education at the Yeshiba of R. Bezalel Ronsperg. In 1825 he went to the University of Budapest. He was one of the first Jews trained in secular fields to serve as a rabbi in Bohemia. After filling several rabbinical posts in Töplitz and Dresden he declined in 1843 the chief rabbinate of Berlin—a position never since filled—because of the equivocal character of the Prussian government's reply to his demands for full legal recognition of the Jewish communities and the abandonment of state support of Christian missionary activities among Jews. In 1854 he became president of the new theological seminary in Breslau.

He was the outstanding intellectual leader of conservative Jewry in Germany and exercised great influence over the younger generation of rabbis and Jewish scholars throughout central Europe. During the stormy days of reform in the forties he rejected the Hamburg prayer book, spectacularly left the rabbinical assembly in Frankfurt and insisted in general upon preserving traditional observances, Hebrew prayers and the hopes of a restoration to Palestine through a personal Messiah. He laid down a program of preserving "positive-historical Judaism" in practical life while permitting relatively free research in post-Biblical sources. In defense of his theological view against both extreme orthodoxy and reform he issued the *Zeitschrift für die religiösen Interessen des Judentums* (Berlin 1844-46). Later he edited the prominent scholarly periodical, *Monatsschrift für Geschichte und Wissenschaft des Judentums*, which he edited from its establishment in 1851 until 1867. Frankel's studies in jurisprudence introduced the comparative method into the investigation of Talmudic law. Their main thesis was that Talmudic law was independent of Roman law, although Frankel admitted that certain similarities might flow from a common source. The historical school in con-

temporary German jurisprudence strongly appealed to him. His book *Die Eidesleistung bei den Juden* (Dresden 1840, 2nd ed. 1847) was a significant contribution to the efforts to abolish the oath *more judaico* throughout Germany and in France. His important investigations into the methodology of the Talmud and the dependence of the Greek and Aramaic versions of the Bible on Palestinian traditions are still of considerable scholarly value.

FRANKING. Derived from the French *franc*, this term has been used for upwards of three hundred years to denote the right of sending letters, documents, newspapers and packages through the mails free of charge. Properly, it does not apply to the carriage of matter which a government as such sends out, but is reserved for the free transmission of mail for the benefit of private individuals or corporations or of legislators and other officials when sending out communications or documents not required to be dispatched in the performance of duty.

So far as the records show, franking as thus defined was an invention of Cromwellian England. The Council of State in 1652 gave orders that the letters of all members of Parliament, of all officials and of all other persons acting in a public capacity should be carried free; and in the following year the people to whom the posts had been farmed agreed to carry free also all letters addressed to parliamentary members. Following the Restoration an act of Parliament in 1693 authorized the free carriage during the current parliamentary session of all letters from and to the king, the great officers of state and members of Parliament. The practise established itself impregnably and for more than a hundred years was continued with no express parliamentary authority at all.

In the later seventeenth and earlier eighteenth centuries abuses of the franking privilege became notorious. Members of Parliament frequently received from their constituents batches of letters to be readdressed under their signatures. Private individuals forged the names and imitated the seals of the privileged for their own use, and the selling of counterfeit franks developed into a regular business. Newspapers being entitled to be sent post free, people wrote their messages on them in "invisible ink" or even by dotting letters or pricking through them. Repeated warnings and investigations had little effect.

Until the accession of George III all postal revenues accrued directly to the sovereign and all postal regulations took the form of warrants issued in his name. In 1763, however, the revenues were surrendered in exchange for a fixed sum from the Civil List and were thereafter paid into the Consolidated, or as it was then called the Aggregate, Fund; and, inasmuch as postage could no longer be remitted without authority of Parliament, an act was passed which for the first time placed franking on the basis not of a concession granted by the crown but of a right conferred by statute. The opportunity was seized to impose restrictions and penalties which, it was hoped, would curb abuses and by so doing appreciably improve the postal finances, but the new regulations proved almost as ineffective as those previously set forth in warrants of the crown.

In 1837 Sir Rowland Hill made an unanswerable plea for the suppression of the system in a widely circulated pamphlet entitled *Post Office Reform*, and in 1840 Parliament when providing for a uniform penny rate for letters throughout the United Kingdom put an end to franking in every form except for correspondence emanating from or addressed to government departments or their local officials on the service of the state. All later attempts of members of Parliament to reinstate the former pernicious system have failed.

The United States has never suffered as seriously from the franking evil as did England, but on the other hand has not arrived at any full solution of the problem. The practise originated in an act of the Continental Congress in July, 1775, establishing the Constitutional Post Office and extending the franking privilege to members of Congress and army officers. Another form early taken was that of free exchanges of newspapers by their editors as a means of

promoting communication between different states and localities in the period of the Confederation and after. As the number of newspapers grew in the earlier nineteenth century, the burden upon the post office increased. Proposals to abolish free exchanges were resisted as "unconstitutional" and subversive of "the strongest bulwark of free government."

In reenacting earlier legislation in 1792 Congress sought to keep the franking privilege within bounds. Despite all efforts, however, it expanded steadily during the next half-century, and minor government officials, ex-presidents, their widows, signers of the Declaration of Independence and other groups of prominent citizens were added to the list. Along with post free distribution of documents by the government itself these privileges cut heavily into postal revenues, although never until very recently were accounts kept in such a manner that the precise extent of the burden could be known.

An act of March 3, 1845, imposed some restrictions, but another of March 3, 1863, while tightening up in connection with executive and administrative franking authorized members of Congress not only to send their correspondence post free at all times but also similarly to distribute "seeds, roots, and cuttings" in connection with the work of the Department of Agriculture. By act of January 31, 1873, franking was indeed abolished, but the sequel was less fortunate than in England under the act of 1840. The American congressman could not reconcile himself to the loss of so valuable a privilege, and from 1875 onward special acts revived it not only as applying to senators and representatives but for the benefit of ex-congressmen (for nine months after the close of their terms), congressmen-elect and other groups both official and non-official. Possession of the right in its present broad form by members of Congress materially affects the conduct of business in the two houses, especially by the injection of speeches (not always, however, actually delivered orally) intended primarily for later distribution among the member's constituents; it also figures in political campaigns, since much of the franked material sent out is designed, directly or indirectly, to win votes.

Under existing laws postal matter from which no revenue is derived falls into four categories: (1) correspondence carried on and publications distributed under the penalty privilege by departments and establishments of the national government; (2) correspondence of members of

Congress and speeches and other documents sent out by them; (3) country newspapers within the county of their publication; and (4) books, pamphlets and other reading matter in raised characters for the use of the blind. During the fiscal year ending June 30, 1930, the total number of pieces handled free was 767,145,388, from which a revenue of \$11,037,152 would have been derived had postage been paid. Congressmen franked about 35,000,000 pieces equivalent to \$718,000 in revenue; other persons franked 6,987,761 pieces, which would have yielded \$154,545. But the privilege, while indefensible in principle and subject to gross abuse in practise, is accountable to only a limited extent for the unfavorable balances shown by the postal business in the United States.

FRANKLIN, BENJAMIN (1706-90), American statesman and scientist. Franklin was born in Boston of English ancestors, and there he learned the printer's trade under his brother on the *New England Courant*. At the age of seventeen he went to Philadelphia, where in 1730 he became sole owner of the *Pennsylvania Gazette*, which he edited until 1748. During these early years he read widely, learned French, Italian, Spanish and Latin and by constant practise perfected a simple and lucid style of writing. With a passion for improving himself and the community, he founded a debating club, the Junto, prepared annually *Poor Richard's Almanac* (1732-57), which made him famous at home and abroad, founded the Philadelphia library, the American Philosophical Society and an academy which later became the University of Pennsylvania.

With the same conscious deliberation he fashioned a religion by deciding that whereas a materialistic theory of the universe might be true, it would be more "useful" to believe in God and the immortality of the soul and to practise the useful virtues, which turned out to be thirteen in number. In 1748 he retired from active business with the intention of devoting his life to science, which fascinated him more than any other subject. During the next six years, making experiments with "an electric tube" and with "Musschenbroek's wonderful bottle" (Leyden jar), he "established the essential phenomena of the condenser." The identity of lightning and electricity was demonstrated in France in 1752 by methods suggested by Franklin, who later confirmed it by his famous kite experiment (on this disputed subject, see Jernehan, M. W., in *New England Quarterly*, vol. i, 1928, p. 180-96).

After these six years of leisure Franklin was drawn into politics. In 1754 he attended the Albany Congress and drafted a Plan of Union, which the Congress adopted but which was rejected by the colonial governments because it had in it "too much prerogative" and by the English government because it contained too much of "the democratic." In 1757 he went to England to press the claims of the Pennsylvania Assembly to tax the proprietary estates. He remained there five years and found life so agreeable that he was loath to return. In 1760 he published *The Interest of Great Britain Considered* (Boston), to which was appended a paper written in 1751, "Observations concerning the Increase of Mankind," which anticipated some of the ideas of Malthus on population. It is supposed that these papers had some influence in deciding Great Britain to take Canada instead of Guadeloupe from France in 1763. From 1764 to 1775 Franklin was again in England as agent of the Pennsylvania Assembly (after 1768 he was also the agent of Georgia and after 1770 of Massachusetts). During the early years his influence was conciliatory; he was regarded in America as too English and in England as too American in his views of the controversy. But his residence in England gradually abated his admiration for the English government and strengthened his American sympathies, and after 1770 his influence was rather to embitter than to compose the quarrel. By procuring and sending to Boston certain private letters of Governor Hutchinson of Massachusetts he did much to make the dispute irreconcilable. As his bias changed his views of American rights were extended and strength-

ened. Upon his return to America in 1775 Franklin was elected to the Second Continental Congress and served on many committees, including the committee to draft the Declaration of Independence. In 1776 at the age of seventy he was sent to France as representative of the Congress and remained there in that capacity until 1785. He was of incalculable assistance to the colonies during the war. In France, according to John Adams, his fame was "more universal than that of Leibnitz or Newton, Frederick or Voltaire" (*Works*, vol. i, Boston 1856, p. 660). He was chiefly responsible for keeping the French government well disposed toward the colonial cause and for obtaining the financial assistance without which the revolutionary war could scarcely have been brought to a successful conclusion. He took a leading part in negotiating the treaties of 1773 and 1778. After his return to America in 1785 he was made president of the Executive Council of Pennsylvania and in 1787 served in the Constitutional Convention, where he exercised a great influence in composing quarrels and took a leading part in framing the compromise between the large and the small states on the question of representation in the House of Representatives. His last public act was to sign a petition for the abolition of slavery.

Franklin was fortunate in being by temperament and character in harmony with his age. He accepted easily and expressed without effort all the characteristic notions of the Enlightenment. He was fortunate also in enjoying a wider experience than falls to the lot of most great men. Rising from poverty to affluence, he lived on every social level and was equally at home with kitchen girls and kings. He lived for twenty-five years abroad, either in England or France, and came to know personally or by correspondence more men of distinction than any other man of his time. All this experience he easily assimilated without being warped by it. His amazing success in practical affairs and in assimilating experience was perhaps the result of his disposition to take life with infinite zest and yet with humorous detachment. Apart from his scientific experiments his activities seem to have been the result of outward pressure rather than of inner impulse. In all of his dealings with men and affairs one feels that Franklin was never wholly committed. Nature alone met him on equal terms; she alone enlisted in the solution of her problems the full powers of his mind.

FRANKO, IVAN (1856-1916), Ukrainian writer and national leader. Franko was born of a peasant family in Galicia. He studied at the university in Lemberg and even in his student years identified himself with the ideal of social and political liberation of the Ukrainian masses. Under the influence of Drahomanov he formulated a socialist program based on a combination of anarchic syndicalism and agrarian federalism and was soon recognized as the intellectual leader of the Galician workmen's movement.

He displayed a wide literary and political activity unchecked even by frequent imprisonments: he founded the first Ukrainian socialist publication in Galicia, wrote a handbook on political economy based on Chernyshevsky, Mill and Marx, translated parts of Marx' *Das Kapital*, popularized the principles of socialism, helped to draw up the first program of Galician socialists and aided in the development of the Polish Social Democratic party. Franko, however, was enough of a realist to be interested more in possibilities of immediate political reform than in discussion of remote forms of the social order and devoted much time to the organization of all democratic elements in Galicia, Polish as well as Ukrainian. With Pavlik he founded the Ukrainian Radical party in 1890, which besides preparing the ground for Ukrainian Social Democracy consolidated the peasants into an independent political force that had a far reaching effect on the political and cultural development of the Ukrainian nation.

Franko's influence transcended the realm of politics. His position as poet of the Ukrainian renaissance is second only to that of Shevchenko. He also attained fame as a scholar and critic but was barred from a professorship of Ukrainian

literature by pressure of conservative politicians and reactionary clergy.

FRANTZ, KONSTANTIN (1817-91), German publicist and political theorist. Frantz steered an independent course between rationalism and the various systems of German idealism and romanticism, all of which influenced him, as did Comte, the French socialists, List and Marlo. At first a Prussian patriot like Bismarck, Frantz later advocated a Christian pan-German federalism, to be founded on a synthesis of liberalism and socialism, and fought the German Reich created by Bismarck. His numerous writings, containing a strange mixture of political realism and utopianism, often of prophetic character, exercised no effect after 1866 but experienced a renaissance after the World War, especially in democratic and pacifist circles, although Frantz was neither democrat nor pacifist. He opposed the nationality principle because of its relation to the doctrine of natural rights, but he saw might as the core of politics and added to Montesquieu's list of three state powers a fourth, the military. He criticized all parties in Germany, most of all the Liberals because of their atomizing political and capitalistic economic attitude, and attacked the system as the reign of the bourse (reign of the Jews). For the Conservatives as a party he cared little, although his teachings were conservative throughout. He advocated a "true" national economy, empirically grounded, to investigate the interaction of economic branches and socio-political institutions. An early advocate of the cooperative system, he proposed to develop mediaeval institutions along modern lines. He considered the state as a product of nature and of history but in the main as the work of man with the attendant moral qualities of good and bad. The state was to be built up pyramidically of the different professions and social and political unions. Constitutionalism, bureaucratic-absolutistic centralism and particularism were equally rejected by Frantz.

In world politics Frantz again advocated federalism. To check the political and economic imperialism of the United States and Russia, which he regarded as the only really great powers by reason of their natural resources, he desired to make the German *Bund* (Germany and Austria-Hungary) the basis of a central

European federation toward which England would incline, and which, Frantz believed, could develop into a Kantian league of nations.

FRATERNAL INSURANCE. *See* FRATERNAL ORDERS; INSURANCE.

FRATERNAL ORDERS. This term as commonly used designates a variety of associations which combine secrecy and sociability with financial cooperation in meeting one or more of the contingencies of life. In its widest connotation it includes both secret and non-secret social and benevolent societies, ranging from local working men's mutual benefit associations to such national and international secret societies as the Freemasons and the Loyal Order of Moose, in which beneficiary features are subordinate to the appeals of good fellowship and ceremonialism. Concurrently with the proliferation of fraternal orders has occurred the growth of secret college Greek letter fraternities and of such attenuated non-secret bodies as the Rotarians and the Boy Scouts. But as usually defined in American law a fraternal order is a voluntary association for mutual benefit, organized under a lodge system with representative government and making provision for payment of death and other benefits. It combines certain features of the older friendly society with certain features of the secret society typified by Freemasonry. The English friendly societies, dating from the sixteenth century, became during the nineteenth century important working class agencies in providing for sickness, old age and funeral expense; their principles were carried over into the United States and the British colonies to become the basic elements in the modern fraternal society. From the Masonic movement the fraternal order derived ideas of organization, government,

secrecy, ritualism, symbolism and sociability. The true prototypes of the modern fraternal order were thus certain secret societies patterned after Freemasonry which emphasized their benevolent features. Such include the Independent Order of Odd Fellows, the United Ancient Order of Druids and the Ancient Order of Foresters introduced into the United States in 1819, 1830 and 1832 respectively and the Improved Order of Red Men, the oldest beneficiary society of distinctly American origin. A few of these early societies later adopted those insurance features which have converted them into true fraternal societies; nevertheless, of the nearly two hundred orders furnishing life insurance as a main feature in 1931 only some half dozen antedate 1860.

The phenomenal growth of fraternal orders throughout the English speaking world since the middle of the last century has been associated with the development of democratic institutions and the consequent freedom to form voluntary associations for the promotion of common interests. Many orders have been based on a consciousness of kind arising from occupational, moral, racial or religious similarities. Many have existed in connection with skilled trade unions; many have limited their membership to particular national or religious groups. Of the two hundred largest orders operating in the United States in 1931, one third recruit from immigrant racial elements; those among the Poles, Jews, Slovaks, Czechs, Croats and French-Canadians are especially numerous, while a dozen other immigrant groups have one or more societies. Nearly one sixth of them have the word Catholic in their names, indicating that the opposition of the Roman Catholic church to secret societies does not extend to fraternal orders. The Knights of Columbus, for example, has become one of the largest orders both in membership and assets. Many societies formed for specific political, reform or religious purposes have included sick, funeral or certain other benefits among their attractions. Of the considerable number of patriotic and political societies formed about the middle of the last century the Order of United American Mechanics, the American Protestant Association and the Brotherhood of the Union have paid such benefits. After the Civil War certain trade unions, influenced by the increasing popularity of the secret fraternal orders, adopted the lodge form of organization. In addition there existed thousands of mutual assessment associations, especially among Negroes and

special labor groups; most of them were of short duration, and little is known of them.

The order which seems to have served as a new model for fraternal societies in America was the Ancient Order of United Workmen, Jefferson Lodge Number 1, founded in 1868 at Meadville, Pennsylvania, by a Mason named John Jordan Upchurch. Designed originally as a social and defensive organization for working men, it began after its first year to pay a substantial death benefit by means of an assessment of one dollar per local lodge member upon each death. From this levy funeral expenses were paid and the remainder, up to and not to exceed \$2000, was given to the deceased's family or heirs. This life insurance or death benefit feature in its various forms together with the popular prejudice against regular life insurance companies and the fact that ordinary insurance was not readily available to members of the middle and lower classes led to a rapid expansion of fraternal orders. When during the seventies more than sixty old line companies failed amidst extensive evidence of deceit and corruption, there developed an almost fantastic belief in the financial legerdemain of the assessment principle and an unreasoning opposition to the value of accumulating reserves to offset the increasing mortality of age. As a result the public was grievously exploited by wildcat commercial assessment companies and ill starred fraternal orders.

Inevitably the uniform levy or assessment proved workable only during the early years of a society, while the membership was increasing at a rapid rate and the majority of members were still young and their mortality low. As the average age of the membership increased and it was no longer possible to maintain the early percentage rate of growth, the death rate and hence the number of assessments rose sharply. Since this threw a disproportionate financial burden on the younger members, recruiting became steadily more difficult and withdrawals were stimulated by the constant formation of new societies offering lower rates and as a rule promises of additional benefits. Many flourishing orders became insolvent; some merged; all were compelled to make radical alterations in their financial operations. By the late eighties the leaders of the movement saw that the only salvation lay in the adoption of sound actuarial methods. The neglect of the simple fact that the insurance risk increases with age would have been even more disastrous if it had not been for the rise in the average longevity of the population. But even

though it has been estimated that, of the 3500 mutual assessment associations formed during the period between 1870 and 1910, fully 3000 failed after an average life of fifteen years, the ideal of mutual aid and the social values of fraternity so harmonized with the democratic aspirations of the day that fraternal insurance itself survived.

Reform proved extremely difficult, however, because of the general ignorance of insurance principles on the part of the rank and file and the vigorous opposition of the older members and of many of those in office. The first reforms attempted to relate assessments to age by such means as the so-called step rate, whereby the premiums advance with age or by age classes (five-year age groups). At first increases in rates were sometimes denied by the courts as violations of the original contract, but in 1915 the United States Supreme Court in *Royal Arcanum v. Green* (237 U.S. 531) guaranteed considerable discretion to the fraternal orders in the revision of their rates. The National Fraternal Congress, founded in 1886 to promote sound actuarial practises, drew up a uniform bill in 1892 and a mortality table in 1899, the enactment of which it urged. It was opposed in this by the Associated Fraternities of America (1901-13). Nevertheless, the conference of fraternal orders and insurance commissioners held at Mobile, Alabama, in 1910 adopted a uniform fraternal code establishing minimum actuarial standards; and this code, slightly modified in New York in 1912, has since been enacted in most states. It has given the insurance commissioners considerable supervisory powers, checked the formation of orders with rates below the safety level and helped to educate the public in the requirements of sound insurance. The Fraternal Congress has continued to advocate state supervision, periodic revaluation of assets and liabilities, better selection of members and enlargement of insurance privileges. It has encouraged the formation of juvenile departments for the insurance of children under sixteen and the modification of those laws which allow only certain blood relations to be named as beneficiaries in a fraternal insurance contract.

As a whole the fraternal insurance business has made steady progress during the past two decades toward a sounder actuarial basis, although it is true that much of it is still sold at an inadequate price. The movement cannot be said, however, to be holding its own. Many orders are still struggling with reorganization problems.

The advancement of rates results in numerous withdrawals and adult membership has steadily diminished in recent years. On January 1, 1931, the 200 leading orders reported an adult membership of 8,198,000, organized into 114,890 lodges, showing a net decline for the year of 378,000 members and 1331 lodges. This decline has been partly offset by the rapid increase in juvenile members during the past decade, their number being 976,400 in 1931. About one third of these orders had uninsured members aggregating 533,700. While only thirty-five were granting sick and accident benefits, all but four were selling one or more types of life insurance. The fraternal society has thus tended to become a mutual insurance company.

The two major appeals of the order, sociability and financial aid, have been weakened by recent social changes. Rapid urbanization, with its manifold attractions and distractions, has all but destroyed the spirit of neighborhood and communal solidarity. The pleasures of lodge night and the lodge sociable have been dimmed by the automobile, the motion picture and the radio. As alien elements have become assimilated they have felt less keenly the need of fraternization and mutual aid. The force of the religious motive has also been weakened in an atmosphere of freedom, democracy and improved material welfare. Political and economic relations have become more impersonal, thus atrophying the spirit of mutual helpfulness, and the increasing complexity of social organization has made personal assistance to fellow members more difficult.

The chief difficulties of the orders, however, appear to be financial. While increasing proportion of the public insists upon complete security for its insurance investments, the repeated raising of rates by the orders during the long period of reorganization has lessened confidence in their methods. Many of the societies have placed soliciting agents in the field to assist in the conversion of old contracts into new ones and to secure the new business that formerly came to them through the personal contacts of their members. These new methods are not yet efficient and economical, and the costs of new business are further increased by a large percentage of lapses during the first year. Consequently the net rates of the fraternal orders are no more attractive than those of some of the old line companies. The future of the orders, which thus depends on their capacity to compete with the regular insurance companies, is not promising. Since 1910 the insurance annually written by them has fal-

len steadily from slightly above one third of the national total to less than one fifteenth.

FRATERNIZING may be either a spontaneous movement or a method of political action. As a method fraternizing consists in making friendly overtures directly to opponents in the hope of breaking down their resistance. Since these overtures are made by those who are openly identified with a cause, fraternizing differs from those forms of propaganda whose success depends on concealing the affiliation of the propagandist. Fraternizing is restricted to face to face relations, while propaganda may be transmitted through secondary channels of communication. Since the initiative is taken for the express purpose of modifying the attitudes of the enemy, fraternizing is distinguished from the friendly approaches of the deserter or the spy.

Spontaneous fraternizing often occurs among contending armies or corps. Soldiers work out a system of arrangements with their antagonists for the exchange of commodities between the lines or even for the suspension of hostilities during times of sleep or play. This tendency is particularly marked where the issue involved in the war does not penetrate to the rank and file.

Where the war is considered an upper class interest, as in dynastic wars or civil wars aimed chiefly at the offices, there is much fraternizing, as in many South American revolutions and in the wars of the late Roman Republic. With the establishment of the conception of the national state fraternizing abates. The emergence of internationalism in the masses, as in the form of proletarian class consciousness, opens the way to fraternizing.

Such friendly intercourse has no place in the strategy of fraternizing except as simple minded sincerity may be exploited for the spread of defeatism. During the World War the Austro-Hungarian command took great precautions to avoid friendly contact between southern Slavs, Italians and kinsmen across the lines. But part of the strategy of Caporetto was to allow socialist and other unreliable elements to build up friendly intercourse with the Italian troops, who were already suffering from war weariness and bitter resentment against the iron disciplinary policy of the Italian high command; just before the offensive began, loyal troops were rushed to the front line. Spontaneous fraternizing may be tolerated if one's own forces are better fed and better equipped than the enemy. Some of the fraternizing on the German-Russian front was intended to depress and to demoralize the Russian soldiers. Disaffected elements may be sought out on the other side, as when the Germans approached the Irish.

A conquering general has sometimes used fraternizing to reduce bloodshed in consolidating his victory and also in diminishing the possibility that resentments will produce an early revival of resistance. Caesar was able to remove the army of Pompey in Spain by means of adroit manoeuvres and fraternizing and to hasten eastward to deal with Pompey himself, reasonably insured against revolt.

Fraternizing is particularly prominent during civil disturbances, like *Putsche*, coups d'état and strikes, since many common bonds unite the antagonists. Differences of language, tradition, aspiration, physiognomy and dress are at a minimum and a network of intimate personal connections cuts across the battle array. It will be remembered that in the critical days of the 1917 revolution the Bolshevik demonstrators were notably successful in winning over many of the soldiers who were ordered out to suppress them. Employers have often fraternized with their employees in the hope of breaking up an incipient strike movement. In the United States, where

the forms of personal intercourse are informal and democratic, the employers with genial personalities have often proved very successful in maintaining personal rather than categorical relations with their men.

It is important to take account of certain important limitations upon fraternizing as a weapon. Unless one's own side is thoroughly dependable, contact may prove to be a boomerang, as was alleged to be the case at some points where German troops were permitted to mingle with Russian revolutionary troops on the eastern front. It is a very sound impulse which leads the true sectarian to eschew too great intimacies with the rest of the world. Among the true believers mutual reenforcement is provided by the constant reiteration of dogmas, arguments, plans and slogans and by the growth of emotional attachments within the group. Mass confrontation of the opponent occurs but rarely, and fraternizing as a campaign of attrition upon the morale of the enemy had best be conducted by men of fixed purpose.

The strength of fraternizing lies in the powerful appeal which it makes to deep, non-rational motives of the human personality. When approached with respect or treated as moral beings men tend to play the role imputed to them. By stressing the common symbol of "brother, comrade, fellow man" emotional identifications are effectively mediated. Since fraternizing is carried out face to face, advantage is taken of the fact that in primary relations many opportunities are given for emotional interests to arise and for friendships to develop. Moreover, there is always the possibility that friendly yet firm criticism of a ruling regime by an apostle of change may bring to expression slumbering hatreds in the breasts of its adherents. And not the least advantage of fraternizing lies in the repercussion when it fails to win a favorable response from the other side. Any denial of response to friendly overtures activates powerful hostile impulses, especially if the enemy has followed up his rebuff by "atrocities" against those who made the actual overtures.

In applying the method several technical considerations should be borne in mind. If opponents can be dealt with in isolation from their faction, the chances of success are best. The policeman or the guardsman may be approached when he is away from the support of his environment, and much may be done to activate his doubts and to destroy his impression that the enemy is inhuman. In war it has not infre-

quently proved possible to win over prisoners by generous treatment and then permit them to escape back to their comrades. It is advantageous to have personal friendships established in advance of overt conflict. This is one of the incidental advantages of boring from within as practised by the communists and other revolutionists. And it is important to establish confidence by consistently avoiding unfriendly acts.

FRAUD. There is no inherent reason why in primitive societies falsehood should be socially reprehensible. That the duty not to mislead is not fundamental is apparent from the presence in the folklore of almost every people of a "trickster" cycle, as the Jacob cycle of the Old Testament, the coyote stories in North America or the mediaeval Eulenspiegel tales. It is only when deception is practised for profit and results in wealth, power and rank, rewards which ought to be obtained by merit or by divine favor, that it becomes an obvious evil.

Thus it is recognized as a vice before its special association with commercial dealings. There is ample room for deception in an economy that rests entirely upon barter, but obviously the possibility increases as soon as a credit system is established. There is now also the factor of the dishonest promise, the undertaking that is not meant to be kept. Of course the development of modes of security guards against deception to some extent but it can never be entirely eradicated. A certain amount of deception comes to be treated as an inevitable adjunct of business, as a normal risk which must be reckoned in estimating costs and market prices. In nothing have the practise and the profession of Europeans been further apart than in their attitude toward business honesty; no element of European culture has seemed more to justify the repete of hypocrisy in which Europeans have been generally held by oriental nations. The half cynical maxim, "Business is business," expresses the difference between business and ordinary social morality, although the point at which the line is drawn must inevitably be difficult and delicate. Deceit may be objectionable but not "hard" bargains, and between "hard" bargains and "sharp" bargains and between the latter and downright fraud distinction is not too clear except perhaps at their extremes. In popular usage the word deceit is probably preferable to

fraud, which has had various meanings in different legal systems. The essence of fraud is not so much the falsehood it involves as the deliberate desire to enrich oneself at the expense of one whose confidence has first been gained. Socially if not morally the objection to deliberate deceit is that it adds a serious obstacle to social adjustment, since it falsifies any estimate of what one's associates will do and makes it impossible to depend upon their conduct.

In all the very ancient bodies of law, the cuneiform, the Hebrew and the Greek law, frauds in sales, especially in the market, were the subject of legal regulation through market commissioners or otherwise. But there is no evidence that any general doctrine of fraud was ever attained. Of the two terms for fraud in Greek the one, *apate*, seems to have meant the disappointment of expectation and the other, *dolos*, probably meant a lure or bait. At any rate they are used for legitimate ruses in warfare as well as for deceit in the modern sense and there is no conscious paradox in the phrase *euprepes apate*, "a fine deceit." In Athens "fraud upon the people" was applied politically to misleading the ecclesia by false statements.

In Roman law three different aspects of fraud were dealt with from relatively early times, apparently from the time of Cicero. One, as in the other ancient bodies of law, was connected with sales whether of land or of chattels and came under the jurisdiction of the aediles. Another was withdrawal from the reach of creditors of property which should be used to pay them; and the third consisted in inducing others by craft to act to their prejudice.

The latter was the general notion of fraud, the concept of *dolos*. In a characteristically Roman fashion an action of *dolos* was first established as a penal suit sounding in heavy damages, next a defense was allowed to claims founded upon *dolos* and finally *dolos* became a reason for rescission and for a restitution of the status quo. To this were added in later times independent criminal penalties. The clear cut and frequently repeated description that *dolos* is found whenever a present or future situation is different from what anyone pretends it is or will be, *aliud simulatum, aliud actum*, provided a formula flexible enough for all purposes and differentiated it from those various types of unfair dealing in which the oppressive character might be due to accident or misfortune without being thereby less in need of redress. The latter group of situations, best typified by "fraud on

creditors," were those in which the term fraud (*fraus*) was properly applied, but by a not unusual shift of terminology this word has displaced *dolus*, except in technical legal usage, in most languages derived from Latin. Yet the Roman and English specifications for fraud, for instance, are notably different.

The Germanic tribal customs hardly allowed for a theory of fraud. A man had what he was clever or powerful enough to win, and markets were little different from tournaments in which cunning took the place of skill in arms. The church attempted to protect the weaker of the parties in a bargain, but even the schoolmen did not emancipate themselves from the notion of a bargain as a contest of wits and the canon law had nothing to add to the concept of *dolus* which the revived Roman law made familiar. Indeed the natural economy of the Middle Ages gave few opportunities for fraud except for the cruder forms of overreaching. In sales guild responsibility and pride of achievement often compensated for the want of warranties of quality. As for the highly important feudal transfers of land, the chief business of the Middle Ages, these were hedged in by so many conditions and forms that ingenious turns were likely enough to be effective: Chaucer's Sergeant could make fee tail fee simple and vice versa.

Mohammedan law, which may well be a direct development of a Levantine common law, however much determined by the Koran and the Bible, amalgamated the concept of usury (*riba*) with that of overreaching, or rather treated overreaching as a form of usury, i.e. of interest, which was as strictly forbidden by the imams as it was by the mediaeval church. It does not appear, however, that other forms of fraud were specifically noted.

England was economically a backward country until well into Tudor times. It is not surprising therefore that the rule of caveat emptor, i.e. the notion that in the market one is entitled to get what one takes pains about and no more, was so firmly embedded that it resisted even the growth of equity and the natural law of the eighteenth century. However, there was no lack of power on the part of the courts to deal effectively and drastically with all types of fraud. As early as Bracton in the thirteenth century, when a man was induced to seal an instrument which was wholly different from that which he thought he was sealing it could be made legally void. Still, if the power was not lacking, the practise in the technicalized courts

of common law was soon limited enough. On the other hand, the Chancery soon declared itself the particular enemy of fraud and tried to understand it as broadly as the Romans understood *dolus*. One may even say that it went further, since in applying rules of "conscience" it soon included mistake, extortion and even negligence. Fraud in its legal aspects was soon differentiated into various types: one which would justify the intervention of the Court of Chancery to allow the rescission of a transaction, another which might be pleaded in a court of common law as a defense, a third upon which an action of damages for deceit could be based (indeed, one of the most famous of the common law actions, that of assumpsit, was based upon the idea that an unfulfilled promise for which there had been a consideration was a "deceit") and lastly a fourth, which might be the basis of criminal prosecution. All these were technically differentiated, but except in equity the notion that fraud demanded a knowingly false and intentionally deceptive statement became very nearly the essence of the term.

Modern frauds especially have assumed a wide range. But the legal remedies under modern codes, however much these may differ in their concepts of fraud, still remain either rescission, action for damages or penal measures. But there is a growing tendency for legislation to be preventive rather than punitive and for reliance to be placed upon public administrative agencies and private business bureaus. The economic effects of fraud would be relatively slight if there were any probability that a general contact of consumer and producer could be re-established. As it is, the needs of a competitive system do not tend to scrupulous accuracy of statement. Overproduction and over-readiness to purchase on credit are two elements of no contemptible importance in the existing tendency to unbalance the entire modern economy. The establishment of higher and more rigorous standards, since a complete elimination of every aspect of fraud is not to be expected, would not merely stiffen the moral tone of commerce but might have real and beneficial results on practical economics.

FRAUDS, STATUTE OF. The statute of frauds was enacted by Parliament in 1677, the twenty-ninth year of Charles II, and purported to be "An Act for Prevention of Frauds and Perjuries." It contained twenty-five sections dealing with the making of wills and contracts and with the creation of estates and trusts in land. It was probably drafted in part by Lord Nottingham but was criticized and amended by a committee of judges and others, including Lord Chief Justice North. Some of its sections have been replaced by statutes under other names; but two of them—sections 4 and 17—have become deeply embedded in Anglo-American property and commercial law. The provisions of section 4 have been reenacted without much change in all of the states; the provisions of section 17 were reenacted with some changes in two thirds of the states and are incorporated in the Uniform Sales Act codifying the law applicable to the sale of goods. Lord Tentreden's Act in 1828 supplemented the original statute by making oral promises unenforceable for the purpose of renewing debts barred by the statute of limitations (9 Geo. IV, c. 14).

The need felt for this legislation in 1677 grew out of such facts as these: informal contracts had become enforceable, the rules of evidence were embryonic, parties in interest were disqualified from testifying, the courts had lost much of their earlier control over the jury and the power to set

aside a verdict was undeveloped. The statute was probably useful in checking existing evils. Thayer and Stephen agree that it operated to limit the power of the jury and to reduce the effectiveness of perjury.

The method of preventing fraud and perjury that was adopted in section 4 was to provide that no action should be brought to enforce certain classes of agreements unless the terms of the agreement were evidenced by a written memorandum signed by the party against whom enforcement was sought. The classes included were: suretyship and guaranty, agreements in consideration of marriage, agreements for the transfer of any interest in land and agreements that were not to be performed within one year. By the terms of section 17 contracts for the sale of goods, wares and merchandise of the value of £10 or more were made unenforceable unless there had been a part payment, the giving of earnest, or the receipt and acceptance of a part of the goods.

Opinions have greatly differed as to the functioning of the statute. The confident expectations of its authors are indicated in Lord Nottingham's statement that "every line was worth a subsidy." The disillusionment of his successors after two centuries of experience is seen in a retort by Smith: "Every line has cost a subsidy, for it is universally admitted that no enactment of any legislature ever became the subject of so much litigation" (*The Law of Contracts*, 7th American ed., Philadelphia 1885, p. 74). This flood of litigation has not decreased, until now such cases in the appellate courts alone can be numbered in the tens of thousands. Its meaning and operation can now be determined only by a comparative study of these many cases. L. J. Buckley has said: "It is now two centuries too late to ascertain the meaning of section 4 by applying one's own mind independently to the interpretation of its language. Our task is a much more humble one; it is to see how that section has been expounded in decisions and how the decisions apply to the present case" [*Hanau v. Ehrlich*, 2 K.B. 1056 (1911)]. The task may be more humble, but it is also more difficult.

The margin of merit in the statute is not capable of perfect demonstration. It may prevent the bringing or the winning of fraudulent suits; how many no one can say. It may cause contracts to be reduced to writing that otherwise would not have been, thus avoiding litigation due to misunderstanding and forgetfulness—a matter of mere speculation. In 1821 a South Carolina

judge thus estimated its value: "But for the salutary influence of this statute thousands would tumble into ruin by having their estates taken from them to answer for the debts, defaults, and miscarriages of others" [Leland v. Creyon, 1 McCord 100 (1821)]. Blackstone called the statute "a great and necessary security to private property"; and Kenyon, "one of the wisest laws in our Statute Book" [1 East 194 (1800)]. More progressive jurists, such as Mansfield, Stephen, Pollock, Salmond and Holdsworth, have believed that the statute has outlived its usefulness.

The weightiest evidence against the statute is the mass of litigation itself. In the appealed cases, at least, victory for the defendant seems the triumph of injustice; while victory for the plaintiff, the more frequent result, portrays the apparent circumvention of the statute by the court. An examination of a thousand guaranty cases shows that in about three out of four the statute is held not to prevent enforcement. The devious reasoning by which this result is reached and the resultant narrowing of the statute are enlightening.

The strongest evidence in favor of the statute lies in the fact that it has actually survived; its chief provisions have been voluntarily reenacted in all of the states and there is no agitation for its repeal. Similar requirements have been extended to new classes of cases, such as oral promises to renew a barred debt, the ratification after majority of a promise made as an infant, and promises to pay a commission to a real estate agent.

FREDERICK I (Frederick Barbarossa) (c. 1125-90), Holy Roman emperor. Frederick succeeded his father as duke of Swabia in 1147 and became emperor in 1152, owing his election to

his relationship to the Guelphs. The beginning of his reign was marked by the general reaction against the mysticism of the period of Bernard of Clairvaux which had influenced the preceding emperor to participate in the ill fated second crusade. Under Frederick I the secular character of the German government was restored, although largely based on the cooperation of worldly aristocratic bishops. His method of government, the attempt to restore German influence in northern Italy and his claim of imperial superiority over the papal authority brought him into conflict with Pope Alexander III and the cities of Lombardy, which after a papal schism of eighteen years ended in a compromise in the peace of Venice with the pope in 1177 and the peace of Constance with the Lombardic cities in 1183. The result was the acknowledgment of the legitimate pope and of the Lombardic League, the power of which Frederick checked in his later years by establishing an immediate administration of Tuscany and Romagna. In Germany he endeavored to base the power of the German kingship on an enlarged and more bureaucratically governed duchy of Swabia, which should be the largest duchy in the realm. Hence his struggle with his cousin Henry the Lion, duke of Saxony and Bavaria, which ended in the dismemberment of the Guelphic fiefs in 1180. Generally speaking, the development of feudalism in Germany was completed during Frederick's reign; and in the third crusade, in which the emperor perished, the international fame of the empire reached its highest point.

FREDERICK II (1194-1250), Holy Roman emperor and king of Sicily and Jerusalem. Frederick combined in a remarkable way the political tradition of the Sicilian Normans, inherited from his maternal ancestors, with the imperial claims of the Hohenstaufen family; and by his exalted position he gave enhanced

prestige to the Roman, Greek, Arab, French and Provençal cultural tendencies which he embodied and promoted. He abandoned the exercise of the imperial power in northern Europe to his sons Henry and Conrad and devoted himself primarily to the administration of his Mediterranean domains. In the ordinances of his constitutions of Melfi in 1231 Frederick took the decisive step from the feudal order of the Middle Ages to the modern state. He developed a rigidly centralized royal power in which the feudal nobility was displaced by a bureaucracy that suppressed all autonomy and was made up of jurists schooled in the Roman law and trained in the newly founded state university of Naples. He employed Arabian mercenaries in his army and modernized the judicial system by the introduction of inquests and the abolition of the ordeal and the rack. He curbed clerical influence and advocated the reform of the secularized church, rationalized the administration in its economic, hygienic, educational and social branches, and organized an elaborate financial system with land and poll taxes, customs duties and public control of the grain monopolies. True, the absolute sovereign power was still surrounded with the mystic halo of an oriental, Byzantine monarch and protected by laws against high treason and heresy, yet it acted not only as the source but also as the servant of the law. To the metaphysical Augustinian conception of the foundation of sovereign authority Frederick added another conception, one that was based upon natural law and the purely secular character of the state.

The court of Frederick with its mingling of Arab, Jewish and Christian scholars became an important center for the diffusion of oriental and classical learning. The range and intensity of his own cultural activities are astonishing. Under the influence of Aristotle and his Arabic commentators, notably Averroes, he developed a conception of the universe which, being founded independently of all religions upon the reasonableness of nature alone, shook the very foundations of Christianity and caused him for a long time to be looked upon as the Antichrist. His eager quest for truth in the natural sciences and mathematics led him away from vain book learning to observation and experiment especially productive in ornithology and gave a decided impetus to the growing empiricism of his century. The labors of the translator, which but lately had received fresh

stimulus, brought valuable material to western Europe from the Arabic, Greek and Hebrew. The pompous learned prose style of Frederick's Latin letters of state had a far reaching influence. As head of the Sicilian poetic school he introduced the vulgar Italian into poetry. His interest in the arts (in castle building, sculpture, collections of ancient statuary, coins) had considerable influence on the Renaissance, for whose enlightened despots, eager for knowledge and rejoicing in art, he became the admired and imitated model.

FREDERICK II (Frederick the Great) (1712-86), king of Prussia. Frederick made Prussia one of the great powers of Europe and the rival of Austria for the control of Germany. In his enthusiastic youth he was won to the cause of rationalism and Enlightenment, which was just then mounting to its zenith, and becoming the friend of its major prophet, Voltaire, he wrote in French the *Anti-Machiavel* (Copenhagen 1740; English translation London 1741), an indignant rebuttal of Machiavelli's *Prince*. However, on mounting the throne in 1740 he at once accepted the *raison d'état*, the heart of Machiavelli's doctrine, as his guiding political principle and throughout his reign treated the state as a sovereign entity whose essence was power and which existed by and for itself alone. It was this concept which enabled him to describe himself with conviction and fervor as "the first servant of my state." Enlightened despotism as practised by him was directed primarily toward improvements in the administration, the finances, the law and the army with the sole view of giving greater vigor to the government. Not that the humanitarian motif, inseparable from the movement of Enlightenment, had no part in his legislative activity—acts like the abolition of torture in all but a few cases,

such as treason, and the proclamation in 1740, the first to be issued in Europe, of a practically unconditional religious toleration, patently bear the humanitarian stamp. None the less he regularly put his humanitarian promptings aside whenever they ran counter to solemn considerations of state.

The criterion of state supremacy applied to economics made him a devotee of the bullion doctrine of the mercantilists and the cameralists. Desiring a favorable balance of trade he prohibited as much as possible the importation of manufactured goods and in order to bring a native industry to life granted subsidies with amazing lavishness for so thrifty a monarch. Again, in the case of products which Prussia did not grow, such as tobacco and coffee, he created state monopolies in order to regulate consumption and garner the profits for the national treasury. A more attractive feature of his policy of insistent economic regulation was the initiative he showed in building roads, digging canals and draining swamps. By this last action much new land was won for settlement by colonists. His educational legislation too does not suggest an addiction to startling innovations. True, the *Schulordnung* of 1763 went beyond the practise of the age in providing a modicum of schooling for the country people; but it was accurately suited to the needs of peasants destined to remain peasants. The *Schulordnung* should be regarded as an integral part of his social policy, which was conservatism itself inasmuch as it aimed to keep unchanged in their respective positions the two main classes of this still feudal state, the peasant serfs who tilled the soil and the *Junkers* who owned it. At dinner with Voltaire the king talked like a philosopher who was ready to reshape the world; but on retiring to his cabinet he issued orders for his enlarged and prospering Prussia indicative of the greatest respect for the principle of historical continuity.

With his attention riveted on the greatness of the Prussian state Frederick was wholly indifferent to the movement of German nationalism which came to birth in his lifetime. The emotional and romantic character of the German nationalism of the *Sturm und Drang* period elicited from Frederick, the child of an earlier, rationalist age, a double measure of contempt. The situation is not without keen irony, for Frederick by successfully resisting a world of enemies in the Seven Years' War fostered the nationalism which he disliked, while the nation-

alists in their need of individual instances made him a German hero despite himself.

FREDERICK WILLIAM, (The Great Elector) (1620-88), elector of Brandenburg. In 1640 Frederick William succeeded to the throne of an impoverished country menaced by imperial, Swedish, Dutch, Spanish and Polish forces. In 1648 the great powers which dominated the helpless empire as well as Brandenburg forced the elector, in the Peace of Westphalia, to surrender his right to inherit the important Baltic port of Stettin. Painfully aware of a defenseless ruler's lack of rights amidst superior military powers, he was unable, until the Northern War fought between Sweden and Poland from 1655 to 1660, to achieve a decisive success and win the sovereignty of Prussia. This he accomplished by opportunistically utilizing the changing phases of the war and by raising an army without the consent of the estates of Prussia or Cleve.

He never surrendered the authority won in the war. After bitter conflicts, which he sometimes decided by the use of force, he wrenched new constitutions from the estates of Cleve in 1661 and Prussia in 1663 as he had done from the estates of Brandenburg in 1653. These constitutions granted him above all a standing army as an assurance of his political independence. He constantly increased the size of his army, and henceforth it was the chief concern of his administration. He gradually created "provincial domain boards" (*provinzielle Kammer*) and

a central domain board for the exploitation of the large domanian possessions which he had redeemed from pawn. For the administration of the army and the imposts commissariat departments (*Commissariatsbehörden*) were founded, which limited the power of the estates and took over social welfare activities and such matters relating to commerce and industry as the construction of the Spree canal and the admission of the Huguenots. The elector laid the cornerstone of the Prussian bureaucratic state, destroyed the antiquated coregency of the estates, established the principle of religious tolerance and united his territories under a rule which was absolute *de facto* if not *de jure*.

Since Sweden retained Stettin in 1660 only through French influence, the elector repeatedly participated in attempts to break the hegemony of Louis XIV after 1667. In 1675 he drove the Swedes out of the March of Brandenburg but was compelled to relinquish Stettin in 1679. Infuriated by Austria's supposed treason and by its withholding of Liegnitz, Brieg and Wohlau in Silesia, promised him in 1675, and despite hesitations caused by his national conscience, he entered into an alliance with France at the time it took Strasbourg, hoping to win Stettin with French aid. A firm Protestant, he withdrew from France after the repeal of the Edict of Nantes in 1685. He sought contact with the coalition headed by William III of Orange which aimed to establish a European balance of power, to protect Protestantism and to realize the ideal of religious tolerance. For the sake of these goals he was forced to forego his particular aspirations for Stettin and Silesia. The elector approached but never quite attained the position of a great European power. Although the majority of his subjects saw in his state merely a restriction of their liberty, he died convinced that his attempt to found a truly spiritual state serving the ideal of religious tolerance corresponded with the progressive ideas of Bodin, Leibnitz and Samuel von Pufendorf.

FREDERICK WILLIAM I (1688-1740), king of Prussia. Reigning from 1713 to 1740 Frederick William established the absolutist govern-

ment of Prussia as an institution ordained by God, a "kingdom of work" bound by duty and conscious of its responsibility, with experienced and incorruptible officials and an exemplary, economical and provident administration. His energetic mercantilism (the furthering of manufactures, especially wool) produced seven million thaler of annual revenue, of which five millions were used for the army of 83,000 soldiers. By introducing compulsory military service among the nobility he established a body of officers devoted to the state, prepared for sacrifice and imbued with a sense of group honor. By regular conscription of recruits, beginning in 1733, he taught the masses to accept the idea of a permanent armed force. His welfare work among the recruits was a social policy which later resulted in the emancipation of the peasants. The moral level of the country was raised through the founding of public schools based on religious principles. Criminal procedure was reformed with the aid of Cocceji. The welfare of the bourgeoisie was promoted. Official positions, even the highest, were filled on the basis of merit and the administrations of municipalities were purged of dishonesty and inefficiency, so that by severity and example the people might be trained in the fear of God, in duty, in diligence and in simplicity of life. In his foreign policy Frederick William was successful only at first when at the end of the War of the Spanish Succession and the Northern War he gained Lingen-Mörs and Stettin. He was unable ever to attain his principal objects, which were to win respect as a ruler and establish himself as the rightful inheritor of Berg. Nevertheless, he created the basis for Prussia's later position as a great European power under Frederick II.

FREE LOVE. The term is applied, usually in a reprobatory sense, to sexual unions in which social, legal and religious sanctions are dispensed with, but it more particularly denotes the deliberate and reasoned repudiation of those sanctions in theory and in practise. Although the term and the principle apply logically to every

degree of the relation between man and woman, however transient and casual, they are usually understood as having reference to continuous sexual association differing little in substance from marriage except by the absence and rejection of legal or religious conditions imposed by the external authority of society. The issue raised by free love as a doctrine is how far, if at all, the claim of that external social authority to lay down and enforce the terms and conditions of the personal relation and agreement between man and woman is justified on grounds of equity and social necessity or expediency.

The adequate appreciation of that issue involves a consideration of the causes and motives which have led to the social control of marriage. The history of marriage institutions shows that social and traditional control of marriage, necessitated in its earliest form by the rule of exogamy, has in its further development been determined for the most part by economic considerations, such as the respective contributions of the partners, provisions for the upbringing of offspring and finally the transmission of property and social office. Non-economic considerations have played but a small part in its development. The religious grounds which bulk so large at the present day in the traditional conception of these social claims are of very recent cultural origin and have in reality done little more than lend the weighty support of religious and moral sanctions to social regulations already established by economic factors. The Roman religious ceremony, out of which the Christian marriage consecration developed, was but a confirmation of the civic contract.

From these historical considerations it appears that the claim of modern society to impose its sanctions on the personal relation between man and woman derives in a far greater measure from the authority of established tradition as such than from considerations arising out of actual existing conditions. Hence the recurring challenge directed against that traditional authority and the contention that the grounds of equity or social expediency corresponding to actual conditions are alone valid grounds for society's claims to intervene in a contract which is viewed as purely personal.

That challenge has not become formulated until relatively modern times. One reason for this is that only within modern times has the claim to impose coercive social sanctions on all sexual associations been stringently enforced by legal measures and social pressure. That strin-

gency may in fact be said to have its origin in the Protestant Reformation and the rise of Puritanism. As the German jurist Christian Thomasius observed: "Among all civilised peoples, and in all times, until the date of the Lutheran Reformation, concubinage was permitted, and even to a certain extent legally recognised, and was an institution involving no dishonour" (Bloch, ch. xi). The controversy concerning the doctrine of free love developed in both Protestant and Catholic countries but it has been most acute in those of Puritan tradition. The fact that the strict enforcement of coercive sanctions was generally lacking for so long seems to show that they do not discharge a function as indispensable to social order as is sometimes represented by advocates. Unions unconditioned by legal sanctions were recognized in Rome and continued to be recognized by the church as regards the lower classes, among whom indeed down to the present time legal sanctions are in many parts of Europe commonly dispensed with. Other usages dating from pagan times, such as handfasting in Scotland and the "island custom" of Portland, have also survived the influence of religious coercion; and common law marriages in America, which are juridically equivalent to the Roman *usus*, represent a like concession to general extra-Christian usage. Among the upper classes even after the Reformation legal and religious sanctions were often dispensed with where social and economic interests were not involved, and it was not until the fall of feudal power in the last years of the eighteenth and the beginning of the nineteenth century that outward conformity of the aristocratic classes to Puritan standards became general. The quip that marriage was invented during the reign of Queen Victoria is not so wildly paradoxical as it sounds.

Concurrently with the intensified stringency and coercive legal and social enforcement of the sanctions on sexual union, the criticism of their validity from the point of view of rational standards and of equity became more pronounced. Those criticisms, adumbrated in the eighteenth century by Goethe, received full formulation during the period of the romantic revival by such writers as Godwin in England and at a much later period by adherents of the pre-Raphaelite movement, notably Ruskin. The doctrine of free love has formed a prominent part of every socialistic or communistic scheme of social reform from the time of Fourier and Saint-Simon and indeed even from that of Plato. The rationalization of social organization in general carries with

it as a corollary the rationalization of sex relations. In Soviet Russia the social sanctions of sexual association are confined to requiring the notification of its conclusion and its dissolution, economic responsibility for children, however, being unaffected by the separation of the parents. Notwithstanding a degree of legal freedom which does not even place any obstacle on polygamy, sexual associations are said to be nowise looser or more disorderly than under the old conditions. It is curious to note that some non-Russian communities are said to refuse to give official notification of otherwise orderly unions and that in their case Soviet authorities have some trouble in enforcing even that minimum of state regulation.

While the dominant note of the early romantic advocates of free love, such as Shelley and George Sand, was the idea of freedom as an element of individual happiness, the emphasis of more mature and considered defenses of the doctrine is laid upon the suffering and evil resulting from coercive authoritarian moral standards in regard both to their direct effects upon married partners and to their indirect effects upon sexual life in general. The indissolubility, absolute or relative, of marriage, the penalties on unmarried motherhood, the disabilities of illegitimacy, are evils not adequately compensated for by any benefit they may be said to promote. The coercive moral restrictions, the general attitude toward sex, the censorships, the disastrous mismanagement of puberty, which are accounted aids to the safeguarding of coercive marriage, bear likewise no proportion to that professed object. The testimony of cultural history tends to show that not only are great evil and suffering produced by the coercive enforcement of stringent sexual codes, but that the effect of such coercion on loose conduct and unwholesome sexual manifestations is not proportionately appreciable.

The freedom which modern criticism of coercive marriage has in view is not the promotion of individual happiness by license, but the abatement of needless suffering and evil resulting from groundless and unwarranted coercion. The extended freedom which it advocates is not desired for its own sake but, on the contrary, as a means of realizing more completely the ideal of monogamic sexual association. Such freedom from authoritarian coercive social sanctions and restrictions in regard to the personal contract of sexual association calls for a larger measure of the self-control and reciprocal limitation of indi-

vidual freedom which every form of association implies.

By far the larger proportion of the opposition to doctrines of free love and to criticisms of coercive marriage rests on appeal to authoritarian and dogmatic religious tradition. If those grounds be excluded, the issue resolves itself into the question of how far the contract resulting in the association of man and woman is a purely personal one and how far interests other than those of the contracting parties are involved. Society, represented by the state, has the right to intervene as regards the latter but not as regards the purely personal aspect of the relation. The view that it is a function of the state to protect its members against themselves has here little relevance for in this instance, under existing conditions, the action of the state has exactly the opposite effect. In no aspect of life are disastrous mistakes more frequent than in regard to the sexual relation, yet the action of the state as at present carried out places every obstacle in the way of rectifying such mistakes and, far from protecting the individual, prevents him from protecting himself. State interference is powerless to remedy the intimate personal difficulties attaching to the association, and its scope is thus limited to the protection of social interests extending beyond those of the contracting parties.

The nature of these interests depends upon social conditions. Marriage institutions, as above noted, have developed in relation to those conditions and have in general changed with them. Dogmatic and authoritarian religious tradition has imparted fixity to regulations which call for continual adaptation. Many of the economic factors which once conditioned the development of marriage institutions no longer operate at the present day in the same manner as when the form of those institutions became invested with moral sanctity. The importance of the family as an economic and segregated social unit for the transmission of property and social status has diminished. Parental claims have in consequence become weakened, education has become in a larger degree socialized. Above all, the claims of women to equitable economic and social independence have challenged and sapped traditional patriarchal conceptions. The personal relation between man and woman has more and more displaced the economic motives in importance, and even procreation cannot be said to be the first and essential motive leading to the association. This substitution of the psychological for the economic values of the association

implies an enhanced importance of the personal, as opposed to the juridic and economic, relation and an extended basis of mutual consideration making for common happiness. These changed conditions, the new orientations of modern thought, the general decay of traditional and dogmatic authority, discount the force of many of the common objections to doctrines of free love.

At the same time, economic factors cannot under existing conditions be entirely eliminated; and so long as they are involved some measure of social control is indispensable to regulate and protect the implicated interests. Free love in the full sense of the term postulates complete freedom from economic factors, the economic independence of women and social provisions for the upbringing of children. Such an ideal does not belong to the conditions of capitalistic societies as at present constituted. The aims of marriage reform at the present day have reference to the more limited but yet vital freedom from coercive sanctions and controls founded upon authoritarian and dogmatic traditional grounds, in so far as these are productive of suffering which is not adequately justified or necessitated by social requirements.

FREE PORTS AND FREE ZONES are enclosed free trade areas usually located in maritime cities within the territory of a country with a protective tariff. Ships may enter such areas, discharge and load cargoes and depart without paying customs duties and being subjected to customs inspection. Goods may be stored, repacked, sorted, reexported and in some instances manufactured free from customs formalities. The tariff regulations become effective only when such goods are conveyed to the interior of the country beyond the boundaries of the free area.

The origin of free ports is closely connected with the rise and development of international

commerce. In the Middle Ages certain cities granted trading privileges, which amounted at times to the creation of free trade zones, with respect to groups of merchants, classes of commodities, specified periods of time or selected geographical areas. In the period of mercantilism the general movement for national economic consolidation behind high tariff walls threatened to disrupt international trade and many countries found it indispensable to exempt certain maritime cities from the general customs regulations. Thus Leghorn and Genoa were declared free port towns in the sixteenth century; Naples, Venice, Marseille, Bayonne and Dunkirk in the seventeenth century; Ancona, Messina, Trieste, Fiume and Gibraltar in the eighteenth century. The Hanse towns Hamburg and Bremen, which were made free ports in the early years of their existence, retained their privileges throughout this period. In a system of early capitalism the free port privilege was an important factor in the development of an active carrying trade, and most free ports became prominent as distributing centers for overseas imports, serving the entire continent.

With the growing industrialization of Europe in the nineteenth century the importance of the carrying trade in the economic life of the principal countries declined and the free port cities became to an increasing extent trading outlets and inlets for the hinterland. The *raison d'être* for free port privileges was thus disappearing. At the same time governments began to resent the loss of revenue entailed by the exemption of large areas from the customs territory; extensive free areas difficult to supervise offered large opportunities for smuggling. One by one free ports were reincorporated in the general customs territory, so that by the end of the century free port cities almost completely disappeared in Europe.

Free ports were not, however, entirely abolished. Some of the free port cities were permitted to retain a free zone where the business of the former ports could be carried on as before. With the subsequent development of large scale shipping and international commerce free zones were established in the ports of other countries. In the post-war period the multiplication of boundaries, the upward movement of customs tariffs and the general desire of countries to emancipate themselves from dependence on intermediaries in world trade and to capture a slice of the trans-shipment trade for themselves led to a rapid extension of the device of free zones, with the result that there is at present hardly a

protectionist country of economic significance which does not provide or contemplate the provision of free zone facilities.

The free zone is important as a device for the centralization of international trade at a few focal points. The exclusion of the zone from a country's customs area makes it the natural distributing point for imports intended for reexport. In this respect the free zone is superior to the system of refunding the import duty upon reexport; the latter entails formalities which may prove irksome. Since the importer into a free zone is at liberty to dispose of his goods either by reshipping them to foreign markets or by selling them in the domestic market he is inclined to handle larger quantities and tempted to speculate on future demand on a larger scale; this makes for an increase in the turnover of a free zone. Shipping concerns are naturally attracted to free zones even at some sacrifice in rates charged for freight, because the opportunities of securing cargoes are better. This development is further reenforced by the tendency toward the concentration of transoceanic traffic in a few leading ports. The increase in tonnage and draft of ships necessitates well equipped harbors, which are usually provided in free zones, and the increase in capital investment represented by such ships calls for the acceleration of loading and unloading operations, which is facilitated by the absence of customs inspection.

Free zones are generally equipped with spacious storage facilities such as warehouses and elevators in which room is provided for sorting, cutting, repacking and similar operations necessary to prepare merchandise for reshipment to various markets. The warrants issued by such warehouses enjoy general currency in the world markets and are accepted by banking houses engaged in financing international commercial traffic. Manufacturing is prohibited in most free zones, but even in such zones where it is permitted, for example, Hamburg, few industrial plants are found. The high rentals which necessarily prevail in such areas would add needlessly to the cost of production, and in the leading industrial countries the benefit derived from manufacturing in a free zone for shipment to foreign markets would not be great, for important raw materials may be imported duty free under most prevailing tariffs. Unless local reasons favor the establishment of some special industry, the industrial activities of free zones are usually confined to shipbuilding and small scale auxiliaries to shipping.

Free zones are usually opposed by extreme protectionists on the ground that they constitute a breach of the protective principle. Of greater importance is the current objection on the ground of overexpansion of free zone facilities, which for the time being has outrun the trading capacity of the world. Many of the newly established free zones have not justified the expenditure incurred in their equipment; and the excessive multiplication of free zones has rendered more difficult the concentration of trade, thus impairing one of the essential advantages of the free zone.

Outside of Europe free ports exist in some Asiatic colonies of European powers. Hongkong, Singapore and Aden are important centers of the carrying trade; that is, they serve the same economic function as did the European free ports before the nineteenth century. Treaty ports in China did not play the part of free ports, but plans for the establishment of Chinese free ports have been recently discussed. The United States is an outstanding example of a protective country which has never had free ports or free zones. Recent proposals for the establishment of free zones as a stimulus to the development of American shipping came to nothing.

Another device similar in purpose to the free zone is the bonded warehouse and the bonded manufacturing warehouse. The former is a place where goods intended for reexport may be entered and stored free of duty unless withdrawn for purposes of domestic consumption. The latter is a building or enclosed area where imported goods may be handled, altered or manufactured with or without the admixture of domestic materials and parts.

The facilities offered by the bonding system are similar in kind to those offered by the free zones but are inferior in effectiveness. The bonding system does not aid in expediting the entry and clearance of shipping or the handling of merchandise, for shipments must undergo all the formalities of customs inspection before they are allowed to proceed for storage. The requirement of providing bonds, in some instances double the amount of the duty, which are forfeited if the goods are stolen, lost, destroyed or fraudulently removed, increases the cost of handling goods. The goods stored in the warehouses are under the continuous supervision of customs authorities. The handling, sorting, mixing or repacking of the stored goods is impeded by restrictive customs regulations and finally the storing privilege itself is restricted both in point

of time and in the range of commodities. The usual limit on the storing period is three years, after which goods are declared abandoned; and perishable or dangerous commodities cannot be stored in bonded warehouses.

FREE SILVER. The fight for a bimetallic standard found its most striking expression in the free silver movement in the United States. During the Civil War the large issues of currency and the ensuing rise of prices produced a situation in which many economic groups enjoyed unusual prosperity. When after 1865 the government proceeded to retire the greenbacks, strenuous opposition developed and further contraction was eventually countermanded. In the early seventies labor organizations in the east and after the panic of 1873 the remnants of the granger organizations in the west and south entered national politics on platforms which demanded an increase in the currency. In 1878 the industrial and agrarian wings of the Greenback party amalgamated and in the congressional and state elections of that year exerted considerable influence. In the following period of generally falling prices of farm products the agrarian districts in particular increasingly insisted upon a currency policy which would lighten the burden of the farm mortgager and of the debtor classes in general.

In the meantime another group of interests had begun to agitate for an increase in the currency. Legislation enacted in 1873 and 1874 had demonetized the silver dollar and limited the legal tender value of silver to five dollars. This attracted little attention at the time inasmuch as there had been no silver in circulation for forty years. But almost immediately afterward the supply of available silver was tremendously increased by the exploitation of new mines in the

western states and by various factors in the international currency situation. The price of silver rapidly declined. The American silver mines found the most lucrative outlet for their product closed by what they construed as discriminating legislation. As the price of silver continued to fall this legislation was attacked by an increasingly well organized and acrimonious silver party, which by 1877 had mustered sufficient strength to swing the House in favor of the Bland Bill calling for unlimited coinage of silver at a fixed ratio to gold. Although senatorial revision had seriously restricted the scope of the original bill, the final Bland-Allison Act of 1878, by authorizing a monthly silver bullion purchase of \$2,000,000 to \$4,000,000 and by restoring in large part the legal tender value of silver, had represented a substantial gain for the inflationist movement.

The first convention of the Greenback-Labor party adopted an aggressive free silver resolution repudiating the Bland-Allison Act as an unsatisfactory compromise measure, and on a number of occasions in the same year the Greenback-Labor and silver groups cooperated in passing minor measures aimed at their common antagonist, the commercial and banking interests of the east. In the presidential elections of 1880 and 1884 the Greenback-Labor candidates voiced, incidentally, free silver sentiments, but in neither election did the party approximate the strength which it had exhibited in 1878. The post-panic depression was gradually yielding to a period of comparative prosperity. The limited coinage of silver exerted but a slight effect. The new currency tended on the whole to remain in the treasury except in periods of abnormal commercial activity, when it served the useful function of supplementing the rather inelastic banknote circulation. International bimetallic conferences, the first of which was authorized by legislation of 1878, were held at intervals, but the prospects of a binding currency agreement between nations did not appreciably improve.

Agrarian distress, which had constituted one of the mainsprings of earlier inflationist agitation, was still a palpable factor in many sections of the west and even more in the south, but it tended in general to seek relief through non-political cooperation. Farmers' alliances not dissimilar in character to the earlier granges began to spring up and spread through the agrarian sections of the south and the northwest. But it was not until the last year of the decade, under the stimulus of a returning period of depression,

that the first serious move was made toward the organization of agrarian interests on a national scale. In that year the Southern Farmers' Alliance and the Northwestern Farmers' Alliance held conventions in St. Louis and entered into negotiations looking toward amalgamation. Although this was not formally effected, both the agrarian groups endorsed the currency views in the southern platform.

More convinced than ever that his economic interests were being sacrificed by an indifferent government to the commercial and financial powers of the east the farmer was once again on the offensive. The prices of agricultural commodities continued to decline, partly because of the opening up of rich areas of cultivation in the far western states and in foreign countries. Each year the farm debt became more burdensome. Each year the farmer became more dependent for his operating capital on local credit men who charged exorbitant rates of interest. The prevailing credit system had often tended to transfer the management of the farm into alien hands and in many cases, especially throughout the south, had reduced the nominal owner to a state of virtual peonage. For the first time in the experience of the American farmer the alternative of an escape from surrounding depression to the rich acres of an unlimited agricultural frontier was closed. The farmer needed currency and credit and felt that it was the obligation of the sovereign state to provide an adequate supply. This the government had failed to do. During a period of rapid expansion in population and production along all lines the government had virtually restricted its coinage to a single metallic base, which the farmer believed was limited in supply and incapable of adjusting itself to a rapidly changing demand, and the banknote currency to a base of government bonds limited in amount and destined to disappear with the repayment of the public debt.

As to the exact remedy for this situation there was less unanimity of opinion. A number of the remedies proposed indicate unmistakably the persistent Greenbackism of many of the most active leaders in the new agrarian movement as well as their intense antipathy to the national banking system and its bond secured currency. Free and unlimited coinage of silver was likewise urged on the ground that the more plentiful metal had by its fall in price proved itself more sensitive to variations in the general price level. The Populist party of 1891, which drew its greatest strength from the agrarian population

while keeping the free silver question well in the foreground, tended to dissipate its strength on too wide a range of issues. Its somewhat quixotic platform undoubtedly alienated many potential allies, and despite the surprisingly successful showing of the Populist candidates in the elections of 1892 the hopes of the agrarian inflationists were still far from realization. It became increasingly apparent to the more intelligent leaders of the movement that in order to gain a wider following in certain influential circles, especially in the east, it was advisable to restrict their currency program to demands for free silver. Despite its continued appeal in many agrarian quarters Greenbackism rested upon a most insecure basis. The world had experienced too many disorders with irredeemable paper in the past, and there was an underlying fear that additional greenback issues might go the way of continental currency in this country and the assignats in France.

Circumstances within one of the older parties were soon to bring forth a capable leader and to give to the free silver movement an ideological integration and a general prestige which it had hitherto lacked. The Republicans in 1890, as a bid for the tariff votes of the senators from the newly admitted silver states and also to silence the threatening free silver group in Congress, had passed the Sherman Silver Purchase Act. Although this act failed almost as completely as had the Bland-Allison Act to satisfy free silver demands, one of its clauses, specifying that the Treasury certificates issued for the purchase of silver should be redeemable in "coin," involved the succeeding Democratic administration in endless difficulties. To interpret coin to mean only silver would have represented an acknowledgment of the difficulty of maintaining the gold standard. On the other hand, it was not easy to maintain sufficient gold in the treasury reserves to guarantee the exchangeability of the Treasury notes with gold. The act was repealed during the panic of 1893, but Cleveland's frantic attempts to preserve the treasury gold reserve against the steady inflow of silver certificates already outstanding involved recourse to heavy bond issues according to the terms of the Resumption Act of 1875. His unswerving resolution to maintain the gold standard and his willingness to increase still further the dependence of the government on New York banking interests alienated the growing free silver section of the party. The Democratic convention of 1896, after severely criticizing Cleveland's actions, was roused to a frenzy

of excitement by the eloquence of Bryan, who more thoroughly than any other trained political leader had assimilated the traditions of the free silver movement and who in his peroration fused twenty years of free silver agitation.

Despite the strength of this appeal the silver party of 1896 labored under impossible handicaps. Success at the polls could not be gained without complete victory in the agrarian sections of the country, wherein Republican traditions were especially strong. In the manufacturing areas a very large element undoubtedly remained convinced that the primary issue was not silver but protection. The importers and the banking interests with international affiliations were naturally opposed to a silver currency at a time when virtually all European currencies were on a gold basis. Although Bryan was not content to portray merely the abstract advantages of the bimetallic system but charged that the country's currency policy and the general price decline since 1873 were the result of a deliberate tinkering with the country's money in the interests particularly of the creditor classes, generally over the country the international prestige of gold had created an emotional sentiment hostile to free silver. Much intellectual opposition to the Bryan faction was caused by the Republican party's declaration that it would not oppose bimetalism if an effective international agreement among the leading countries of the world could be secured. Although the gold party secured pluralities west of the Mississippi only in Oregon, California, North Dakota, Minnesota and Iowa, the silver party was defeated. Its doom was sealed with the passage of the Gold Standard Act in 1900.

The general rise in prices which began in 1897 and continued during the next decade relieved the distress in agricultural districts. In 1900 the conditions regulating the establishment in rural sections of national banks with note issuing powers were liberalized. But even after 1900 silver was retained as a considerable element in the American currency system. In 1918 the Pittman Act authorizing a huge sale of silver bullion to England carried a provision for the repurchase of an equal amount from American mines; it was made effective in 1920-23. Silver coinage lost its importance, however, as a social and political issue. In the twentieth century the farmer's need for capital led to demands for provision of better credit facilities and of government assistance in marketing. The struggle between the agrarian west and the industrial east

has shifted its emphasis from the monetary to the credit system.

FREE TRADE now implies a commercial policy under which commodities may pass political frontiers without the payment of duties or under which duties are either charged only on commodities not produced at home or offset by corresponding duties on that part of the supply which is produced at home. The term was used in other senses by earlier writers on trade. In the first part of the seventeenth century it usually referred to the removal or drastic modification of the privileges enjoyed by chartered trading companies, such as the Fellowship of the Merchant Adventurers of England or the London East India Company. Contemporary discussion was constantly preoccupied with the possibility of "a more open and free trade." This was the issue raised by the free trade bills of 1604; in 1622, a year of acute industrial depression, the question was referred to the commissioners of trade; and again in 1650 a commission under the chairmanship of Sir Harry Vane was instructed to inquire "whether it be necessary to give way to a more open and free trade than that of companies and societies." This concern about the privileges of the trading companies was only a special aspect of the attack on monopolies. Such privileges often rested on a threefold basis: a grant from the crown, the suppression of internal competition and a protective trade policy. Whatever may be said of the royal intention, it cannot be denied that serious abuses arose in practise. The opposition was vigorous and in the course of it the principle of economic liberty was frequently asserted. Internal monopolies were practically abolished by the Long Parliament

and thus a step in the direction of freedom of trade was taken much earlier in England than on the continent. But the monopolies enjoyed by companies engaged in foreign trade survived, because in this sphere the consequences of competition seemed likely to be disastrous. To insure a favorable balance of trade contemporary opinion considered that some degree of regulation was essential.

The action dictated by the balance of trade theory gave another meaning to free trade. In the last two decades of the seventeenth century there was much discussion of the relative advantages of prohibition and free trade, especially in connection with trade with France. Here freedom meant the conversion of a prohibitory into a moderate tariff. Davenant makes the point clear when he writes " . . . if both Kingdoms can agree upon *just and equal duties* to be laid on their respective commodities, a *free trade* with France can never be dangerous to England." The Whigs, however, for political reasons exploited the notion that trade with France was necessarily harmful. Prohibition had first been imposed in 1678 (29 and 30 Car. II, c. 1) and the policy was confirmed after the accession of William and Mary. Bolingbroke's attempt in 1713 to include more liberal commercial clauses in the Treaty of Utrecht ended in failure. Joshua Gee, a leading merchant often consulted by the government at that time, had no hesitation in declaring that "France, above all other nations, is the worst for England to trade with." It is against the background of these restrictions that the writings of "the Tory Free Traders," Josiah Child, Dudley North and Charles Davenant, must be read. They rightly insisted that the Whig contention was based on the crude consideration of the particular balance of trade with France and not on a more comprehensive view. Incidentally they enunciated broad principles and from isolated passages it would be easy to suggest that they were more enlightened than they actually were. Davenant asserts that "trade is in its nature free, finds its own channel and best directeth its own course." Still it would be a great mistake to suppose that he was a free trader in the modern sense of the term.

The idea that there is a distribution of resources which makes countries interdependent was constantly expressed by mercantilist writers. They often stated it to be a providential arrangement. Gerard Malynes declared in 1601 that "God caused nature to distribute her benefits, or his blessings to severall climates supplying

the barennesse of some things in our country, with the fruitfulness and store of other countries, to the ende that enterchangeably one commonweale should live with another." Sir William Petty adumbrated the theory of the territorial division of labor and in 1676 laid down the rule that "each country flourisheth in the manufacture of its own native commodities." But the mercantilists were not prepared to admit that unregulated trade would be of mutual advantage. The earlier writers were convinced that it would not insure the requisite accumulation of treasure in coin or bullion within their country and their successors felt that it would not maximize employment at home. Consequently the weight of opinion was against the removal of restrictions on trade. The ruling conception of the balance was not effectively challenged until the second part of the eighteenth century. Such free trade ideas as found expression were essentially criticisms directed against the hardships suffered by certain interests or against the commercial implications of foreign policy. Josiah Child, whose political convictions led him to advocate more liberal trade relations with France, was anxious to restrict the trade of the American colonies to the mother country. The regulation of all colonial trade so as to correct adverse balances with foreign countries was generally recognized as desirable. For example, by paying bounties on the production of naval stores in America it was hoped to eliminate England's dependence on the Baltic countries for such supplies.

In England the natural tendency toward economic integration was not hindered by the levying of local duties on the movement of commodities. So far as the inadequate means of transport allowed goods could be moved freely from one part of the country to the other. There is indeed much complaint in the sixteenth century of the invasion of local markets by merchants who offered for sale articles made in more distant localities. Scotland, however, was a separate country and until the union with England in 1707 there were considerable restrictions on trade between the two countries. Severe limitations on trade with Ireland survived throughout the eighteenth century despite William Pitt's attempt in 1785 to initiate a more liberal policy. In western Europe a complicated system of duties existed even within the boundaries of sovereign states. In France, for example, internal economic unity was not achieved until the revolution. There was a network of tolls, feudal dues and

provincial customs duties and even of prohibitions on the movements of foodstuffs. Transport was consequently so costly, where it was permitted, that the peasants often allowed their produce to decay rather than attempt to reach a distant market. Colbert attempted to effect some reforms in this system but without any notable success.

The reaction in France against excessive government regulation led to the first definite formulation of a theory of free trade. The physiocrats, in opposition to the policy of fostering manufactures, insisted that the wealth of a country arose from agriculture and demanded that this should therefore enjoy complete freedom. In this they were primarily thinking of the removal of all restrictions on internal trade. According to their principles there was little or no advantage in foreign trade, a view which naturally made them regard the whole mercantile system as futile. So they were prepared to accept the general application of their gospel of *laissez faire, laissez passer*; that is, the free movement of commodities and persons without any regard to national frontiers. The whole conception of the balance of trade they regarded as absurd and mischievous and they challenged the view that a country could gain any advantage by imposing limitations on trade. It is possible to explain the particular policy advocated by the physiocrats by reference to circumstances of the time. Agriculture was unduly cramped by the restrictions which weighed heavily on the producers. The importance of the physiocrats, however, lies in the fact that they went beyond the criticisms of details and elaborated a complete system. They envisaged a natural order of society, the operation of which was frustrated by the ill advised intervention of governments. The demand for freedom of trade was no longer a protest from those individuals who felt the injustice of this or that regulation; it was the assertion of a general principle.

The reaction against the mercantile system was not so clearly marked in England. There were no internal restrictions of the kind which existed in France and contemporaries were generally satisfied that the commercial policy pursued with respect to Ireland and the American colonies was of advantage to the country. Matthew Decker, who in 1744 advocated the abolition of customs duties on imports and of bounties on exports, exerted little or no influence on opinion. The exposure of the fallacy of the balance of trade theory by David Hume had no immediate effect.

It was left for Adam Smith to subject the prevailing commercial system to detailed criticism in the *Wealth of Nations* (1776). While he shared with the physiocrats a belief in natural liberty, he did not content himself with the assertion of that principle. He examined all the devices of the mercantilists with obvious zest. They were accused of erecting "the sneaking arts of underling tradesmen" into "political maxims for the conduct of a great empire." To his first readers his treatment of this part of the subject must have seemed a resounding challenge to existing practise. He himself felt that the attack would be resented and that "the prejudices of the public" and "the private interests of many individuals" would rally to the defense of the system. "To expect," he wrote, "that freedom of trade should ever be entirely restored in Great Britain is as absurd as to expect that an Oceana or Utopia should ever be established in it." This sense of practical difficulties distinguishes Adam Smith from the physiocrats. The logical completeness of their system proved a stumbling-block to men of affairs. Adam Smith did not elevate the principle of *laissez faire* into an absolute doctrine. There was in his view a strong presumption in favor of its application to contemporary commercial questions. He does not deny that an industry may be acquired sooner by the adoption of protective measures than it otherwise would be; but he insists that the expense of such a measure is certain while the advantage is doubtful. The interest of the people as a whole, the consumers, is much more likely to be promoted by allowing capital investment to take its own course. Similarly the colonial system seemed to Adam Smith to be a great illusion, an elaborate attempt to force capital into a distant trade where it earned a smaller return than if it had been invested nearer home. His comment on the attitude toward trade with France is characteristic: "If those two countries, however, were to consider their real interest, without either mercantile jealousy or national animosity the commerce of France might be more advantageous to Great Britain than that of any other country, and for the same reason that of Great Britain to France." He did not share the contempt which the physiocrats had for foreign trade. Agriculture, industry and trade were all to the national advantage provided they were taken up in the course of things and not forced by artificial means. Any measures which prevented each country from sharing in the natural distribution of the products of the world

must necessarily be harmful, for there was a fundamental economic interdependence.

Adam Smith was skeptical about the influence of theoretical considerations in practical affairs. His arguments received powerful reinforcement from events in the American colonies. The attempt of the mother country after 1763 to enforce the laws of trade met with determined opposition. When the independence of the United States was recognized twenty years later the old colonial system was badly shaken, but by that time British merchants were coming to see that the superiority of their manufactures would insure their hold on the American market. A more liberal trade policy was winning general acceptance. In 1786 William Pitt succeeded where Bolingbroke had failed. A commercial treaty was negotiated with France in which prohibitive duties for the most part gave place to moderate duties. The general principle of reciprocity in trade and navigation was recognized. Unfortunately the outbreak of the French Revolution put an end to this arrangement before its effects could be properly estimated. It is significant, however, that a crisis was provoked in the textile areas in France which was due to the superior industrial position of Great Britain. As far as it went, the experience of the years from 1786 to 1793 served to strengthen the conviction among British manufacturers that greater freedom of trade would be to their advantage.

The almost continuous state of war in Europe up to 1815 violently interfered with the course of trade. Great Britain and France attempted to do economic damage to one another by means of blockades and other devices. The attitude of Great Britain toward neutral shipping provoked the War of 1812 with the United States of America. When peace was restored in Europe in 1815 each belligerent faced the question of what commercial policy ought to be pursued in the difficult period of recovery. In Great Britain the process of industrialization had made rapid although unequal progress and the main problem was whether the post-war dislocation could be met by finding foreign markets for manufactured goods. But the continental countries had all adopted high tariffs. In France Napoleon had deliberately done so to foster manufactures. Although the Restoration monarchy was prepared to modify the policy of prohibition it found vested interests so powerful that a tariff act was passed in 1816 which confirmed a system of high protection. Great Britain had emerged from the war with an unwieldy tariff system which had

been built up in the effort to find sources of indirect taxation for its prosecution. The landed interests had endeavored to safeguard their position by the Corn Law of 1815, which prohibited the importation of foreign wheat until the price reached eighty shillings a quarter. Public distress raised the question whether if foreign food supplies were freely admitted an outlet might be found for British manufactures. One of the banners at "Peterloo" in 1819 bore the words "No Corn Laws." A definite lead was given to opinion by the presentation of the Merchants' Petition to the House of Commons in May, 1820. It was drafted by Thomas Tooke for a group of London merchants and gave precise expression to the leading principles of free trade. "Freedom from restraint," it was asserted, "is calculated to give the utmost extension to foreign trade, and the best direction to the capital and industry of the country." The Manchester Chamber of Commerce, which was founded that same summer, registered the opinion that "to indulge an expectation that other countries will take the manufactures of this kingdom without our receiving in return such articles as they produce, is delusive and injurious to our best interests" (Manchester Statistical Society, *Transactions*, for December 10, 1930). These declarations may be said to have initiated a movement which made steady, if slow, advance during the next twenty years.

The advocates of free trade had the great advantage that the tariff which they were attacking could not be defended on any principle. Their difficulties arose partly from the opposition of vested interests but mainly from the difficulty of suggesting in the absence of the income tax (which had been repealed in 1816) means of obtaining revenue to compensate for any remissions in indirect taxation. William Huskisson made the first inroad upon the system in the years 1823 to 1827. His reforms were moderate and commended themselves to practical business men. Several prohibitions were removed and import duties reduced. He contended that a maximum rate of 30 percent provided sufficient protection to native manufacturers in the hardest cases. The revision of the timber duties, which had been practically prohibitive to the Baltic supply, left the colonies in a preferential position. The principle of reciprocity was introduced into the navigation acts. These reforms naturally raised the question of the revision of the Corn Law of 1815. An attempt in 1827 to introduce a sliding scale arrangement by which the import

duty on wheat should vary with the home price proved abortive; but the Wellington ministry in the following year successfully carried a bill based on the same principle, although less favorable to importation. It was accepted by free traders as an improvement, and a succession of fairly good harvests prevented a vigorous agitation from arising for some years.

Huskisson had removed many of the more unreasonable elements from the British tariff, but he left it a comprehensive protective system. For ten years little progress was made in the direction of simplification. The industrial depression which followed the financial crisis of 1837 reopened the whole issue in a most acute form. There was a succession of budget deficits and the existing tax system seemed quite incapable of meeting the difficulty. The manufacturing interests indeed had largely adopted the view that the burden of indirect taxation was mainly responsible for the failure of industry to recover. In particular they felt that the corn laws operated to close foreign markets to their goods. This conviction led to the foundation of the National Anti-Corn Law League in Manchester early in 1839. Under the leadership of Richard Cobden and John Bright a great campaign was launched which by concentration on the main issue, skill in argument and resourcefulness in methods soon aroused opinion throughout the country. The ground was prepared for a thorough application of free trade principles.

But the practical steps were taken by Sir Robert Peel's ministry from 1841 to 1846. Peel had the temper and outlook of an administrator. He was more concerned with the difficulties of the moment than with theoretical considerations. A Committee on Import Duties, which reported in 1840, had drawn attention to the fact that there were nearly twelve hundred items in the list of dutiable goods and it had suggested that a drastic reduction of these would "facilitate the transactions of commerce, benefit the revenue, diminish the cost of collection and remove the multitudinous sources of complaint and vexation." Peel decided to deal with the national emergency by following these recommendations. Protecting himself against a possible temporary loss of revenue by reimposing the income tax for three years, he undertook a comprehensive revision of the tariff. The general principles of the reforms of 1842 were the removal or relaxation of prohibitory duties; the reduction of duties on raw materials to a point not exceeding 5 percent *ad valorem*, on partially manufactured arti-

cles to a point not exceeding 12 percent *ad valorem* and on manufactured articles to a point not exceeding 20 percent *ad valorem*.

In 1845 Peel returned to the tariff question and sought an extension of the income tax to carry reform to another stage. He now proposed wholesale remissions of duties; some 430 articles, mostly raw materials, were to be removed from the tariff list. His approach toward a definitely free trade position was obvious. But the crucial test of protection to agriculture remained. He had revised the sliding scale in 1841 with the twofold object of preventing speculative dealing and of securing a remunerative price for home grown corn. There he had left the question despite the increasing intensity of the anti-corn law agitation. The dramatic events of 1846 were precipitated by the failure of the potato crop in Ireland. Peel decided that circumstances demanded that the corn laws should go and he carried through their repeal at the cost of all his political prospects. The administration had not only greatly simplified the tariff, it had given a great impetus to the free trade movement. The principles on which rested the arguments for the free import and export of goods had been widely discussed and their complete adoption had been strongly advocated by a growing body of opinion. The navigation laws were repealed in 1849 as a necessary corollary to the abandonment of the corn laws.

While Peel had been influenced by what he felt to be practical considerations, W. E. Gladstone, who had been his lieutenant throughout, had come to the conviction that the work ought to be carried to such a point that the tariff would remain purely for revenue. In his budget of 1853 Gladstone followed the principles that semi-manufactured goods should be admitted duty free and that such manufactured goods as were retained in the tariff should not be charged more than 10 percent *ad valorem*. His task was interrupted by the outbreak of the Crimean War and was resumed and completed in 1860.

But the movement had now taken on a wider significance. So far it had been greatly favored by the trend of events in Great Britain. The enunciation of general principles by economists, while it had not provided driving force, had helped practical men to find justification for what they wanted and to give them a clear objective. The country was becoming thoroughly industrialized in a world where agriculture was still dominant. To change the balance in Great Britain definitely in favor of manufactures seemed

highly desirable if access could be found to foreign markets. Such access could best be secured by accepting their agricultural products. But it was not so easy to demonstrate that other countries would gain from this arrangement. If they had industrial possibilities they might not be best serving their own interests by opening their doors to British manufactured goods.

In France industry had made considerable progress but high protection was maintained until the establishment of the Second Empire, although there was a growing demand from the commercial interests for a less restrictive policy. Events in Great Britain had stimulated a movement in favor of free trade and Frédéric Bastiat had clearly expounded the teaching of the Anti-Corn Law League to his fellow countrymen. Napoleon III had been impressed by the achievements of Sir Robert Peel and made some experiments in reducing tariffs by decrees, but an attempt to remove prohibitions by legislation in 1856 met with such strong opposition that it had to be abandoned. Political considerations, however, suggested the advantage of pressing for better relations with Great Britain and he approved of private consultations between Cobden and Rouher, the minister of commerce, with a view to the negotiation of a commercial treaty. The emperor claimed the right to amend the tariff by treaty without reference to the Chamber. Cobden on his part was averse to the principle of making concessions to particular countries. In the upshot a treaty was entered upon by which France was to remove all prohibitions after October 1, 1861, and to reduce high duties to 30 percent ad valorem. It also conceded a most-favored-nation clause which was to give Great Britain the advantage of any lower duties subsequently granted to other countries. Great Britain, however, associated this treaty with the budget of 1860, which abolished all duties on manufactured articles and brought the number of commodities retained in its tariff down to forty-eight. These concessions were given to all the world and completed the scheme to which Gladstone had committed himself. The terms of the treaty with France were stated in general terms. In the detailed negotiations which followed its ratification France agreed to duties well below the maximum of 20 percent on a great variety of commodities. Moreover, France entered upon a number of commercial treaties with Belgium, the Zollverein, Italy, Switzerland and other customs areas, in which lower duties were often arranged, and under the most-favored-

nation clause Great Britain secured the advantage of these rates.

The Anglo-French Commercial Treaty ushered in a period which witnessed a general movement toward free trade. Cobden and Bright had always stressed the international aspect of their campaign. There were many writers on the continent who believed that universal free trade was well within the realm of practical politics. Economists considered freedom of trade as an axiom of their science. It is true that Friedrich List had in his *Das nationale System der politischen Oekonomie* (Stuttgart 1841; tr. by S. S. Lloyd, London 1885) contended that it was premature for a country to open its doors freely to foreign supplies before its own economic potentialities had been thoroughly explored and developed. He accepted freedom of trade as an end; but he wanted each state capable of doing so to achieve industrial maturity before adopting it. This meant in practice a long period of protection in countries which had made little industrial progress. Germany was, in his view, in this category. But his teaching had no immediate effect. The happenings in Great Britain lent prestige to free trade opinion and the balance of interests in Germany was such that an open market for cereals was attractive, while the danger from the importation of cheap manufactured goods was not widely feared. Within the German Zollverein the influence of the landowners and traders of the north was much more powerful than that of the iron and cotton manufacturers of the south. At its inception in 1834 the Zollverein, following the lead of Prussia, whose liberal tariff of 1818 showed the influence of Smith's ideas, adopted a moderate tariff; the desire to repel Austria and to attract the northwestern states of Hanover and Oldenburg confirmed this policy. The Zollverein was thus prepared to take its part in the negotiation of the liberal commercial treaties of the sixties. A similar movement toward free trade took place in Sweden, while Switzerland continued its non-protectionist tariff policy. Holland by a series of reductions beginning in 1845 and culminating in 1877 eliminated all duties except 5 percent on manufactured goods retained for revenue purposes. Belgium repealed its corn laws in 1850 and by 1857 was practically a free trade country.

But a general system of free trade was never achieved in Europe. The beginnings of a reaction appeared in the seventies and became very marked in the eighties. Among the leading causes must be placed the more violent expres-

sion of national sentiment, the growing industrialization and the improvements in transport which brought cheap American grain to the European markets. In each country there were special circumstances. A considerable body of French opinion had never been reconciled to the policy of Napoleon III. Step by step France returned to a very definitely protective position, which was finally confirmed in the Méline tariff of 1892. In Germany the situation was more complicated. The empire continued the liberal policy of the Zollverein until 1879. The iron and cotton manufacturers still complained very bitterly of the dumping of British goods. The Prussian landowners were beginning to feel the effect of the competition of cheap transatlantic corn. Bismarck was also gravely concerned about the financial requirements of the empire. He decided therefore to revise the tariff; to give a measure of protection to manufacturers and agriculturists which would at the same time increase the yield of indirect taxes. The new tariff which came into force in 1880 imposed a moderate duty on a great variety of commodities, for the main purpose was to raise revenue; but during the discussion Bismarck had definitely expressed the view that whatever the merits of the theory of free trade might be it was impossible to maintain it when other countries were surrounding themselves with customs barriers.

The reaction was also felt in Great Britain. The excess of imports over exports aroused alarm, and it was asked whether the balance of trade was not unfavorable and whether it would not necessarily remain so as long as Great Britain was a free trade country while others were elaborating protective tariffs. The critics of free trade advocated what they called fair trade, a system the essential principle of which was retaliation in tariff policy, although it also contained elements of empire free trade. They demanded a tariff on the manufactures of all countries which did not admit British goods duty free. With the revival of trade in the nineties little more was heard about fair trade. But a much more serious challenge to the free trade position was launched by Joseph Chamberlain in 1903 when he opened his tariff reform campaign. Suggestions had been made from time to time that the British Empire might be more closely bound together by means of a commercial union. The problem was a complicated one because of the variety of tariff policies which existed within the empire. The United Kingdom was free trade, the self-governing dominions had each built up a protective tariff,

while India and the crown colonies had their own systems. Chamberlain's proposals combined ideas of imperial preference with those of protection of the home market and retaliation to force open foreign markets. He had to admit that the taxation of foreign imported foodstuffs by Great Britain would have to be an essential element in any effective scheme of imperial preference. The general election of 1906 was a complete triumph for free trade principles and Great Britain entered upon the World War with her tariff system unmodified. Belgium and Holland also remained essentially free trade countries up to the World War.

The war brought with it a marked strengthening of the protectionist position everywhere. The United States, which in the tariff of 1913 had given some faint signs of abandoning its traditional high protectionist policy and of moving in the direction advocated by the strong intellectual movement in favor of free trade, entered in 1921 upon an era of increased protection. Even Holland and Belgium imposed certain protectionist duties, although they still remain with countries of relatively liberal tariffs. Great Britain imposed duties in 1915 on the importation of certain luxuries with a view to maintaining the foreign exchanges. In 1919 preference was given on practically all articles subject to existing customs duty if they came from any part of the British Empire. Two years later safeguarding rates were applied to certain foreign goods if offered for sale at prices below cost of production or below that at which similar goods could be profitably manufactured in the United Kingdom. Empire goods were exempted from these duties. The proposal for a more thoroughgoing application of protective measures was rejected in the general election of 1923, but some increased protection was instituted by the Conservatives after their return to power in 1924. Protectionist proposals failed again in 1929. Great Britain is still more liberal than any other country in its tariff policy, but the agitation for more protection is very strong. Even many of the trade unionists, including especially those whose particular industry has suffered from foreign competition, such as the textile workers, are moving toward protection, in opposition to the traditional Labour party policy of free trade.

In other countries too the peculiar problems of the post-war years have shaken the faith of many free traders—the concern about the maintenance of “key industries,” the natural unwillingness to see industries which have developed

or grown large during abnormal war years decay in the face of strong foreign competition, the fear of dumping due to the collapse of continental currencies, the difficulty of finding an adequate revenue, the alarming increase in unemployment. For all these it has been suggested in turn that a remedy may be found by departing even farther from free trade principles. The world wide industrial depression has strengthened the agitation. In some cases protection is regarded as a remedy for specific ills of a temporary duration; in others it is advocated as a scientific method of dealing with economic factors.

There is, however, a general recognition of the fact that the heaping up of tariff walls since the war has been a hindrance to economic recovery. Attempts have been made by the League of Nations and other international agencies to induce countries to adopt a more reasonable policy. The International Economic Conference at Geneva in 1927 passed a resolution to the effect that "the time has come to put an end to the increase in tariffs and to move in the opposite direction." The conference recommended that "the nations should take steps forthwith to remove or diminish those barriers that gravely hamper trade." Implicit in the Pan-Europe scheme, in the suggested Austro-German customs union and even in Lord Beaverbrook's agitation for empire free trade is a recognition of the economic value of a large free trade area. But highly abnormal economic, financial and political conditions have militated against the lowering of customs duties, or even the stabilizing of the present rate, by general agreement. Impediments to trading have been multiplied by the break up of great political units in Europe, and national animosities have blinded people to the consequences for themselves as well as for their neighbors.

FREEDOM. *See* LIBERTY.

FREEDOM OF ASSEMBLY. *See* ASSEMBLY, RIGHT OF.

FREEDOM OF ASSOCIATION. The principle of freedom of association has two aspects. On the one hand, it involves the idea of a recognized legal right on the part of all persons to combine for the promotion of purposes in which they are interested; on the other, it includes the right freely to assemble for the purpose of public meeting.

Each aspect of the principle has a long and complex history behind it. Freedom of association has never been universally admitted as a legal right until the present day; and even now it is hedged about, in most countries, with important restrictions which cut at its root. The essence of the problem involved may be said to be the fact that membership in an association the purposes of which conflict with those approved by the government of a given state involves issues of allegiance which the state is not prepared to confront. Until quite modern times these issues revolved round the relationship between church and state. Protestant states tended to limit the right of Roman Catholics freely to worship in their own way, on the ground that they owed allegiance to a foreign sovereign, the pope, and hence could not be regarded as satisfactory citizens of the secular community to which they belonged. Roman Catholic states, as France under Louis XIV, took the view that national unity was impaired by differing religious views; and the revocation of the Edict of Nantes in 1685 was intended to make coincident

membership of the state and the church. In general this phase of the problem is largely although, as Spain, Mexico and Italy make plain, by no means wholly obsolete; and the issues involved have been transferred to other fields.

These are in general political and industrial. On the one hand is the problem of the treatment to be meted out to groups which dissent from generally held views in a particular community. Combination to promote such views has variously been regarded as legal or as so highly illegal as to merit the severest punishment. In Great Britain, for example, there is no legal barrier to the formation of any association however widely its purposes may diverge from those normally accepted by public opinion; action to promote such purposes may nevertheless easily bring its proponents within the ambit of a rather widely drawn law of sedition. In the United States a similar general freedom to combine exists; but most states have passed laws to make illegal combinations which seek to promote syndicalist or communist opinions; the law of California has been most notoriously enforced.

In countries where the tradition of the Roman law has been dominant the case has been otherwise. In France, for example, save for brief moments of revolutionary temper, as in 1789-91 and 1848-49, freedom of association has been rigorously controlled; and its general admission dates only from 1901. While freedom of association is guaranteed to all German citizens in the Weimar constitution, the regulation of the constitutional right is left to the Reichstag to implement by suitable legislation. In Holland a general right of association was established by the constitution of 1848 with, however, the proviso that the law might regulate and limit its exercise in the interest of the public peace. Most modern written constitutions contain similar provisions.

On the industrial side the history of freedom of association is comparatively modern. Broadly speaking, it synchronizes with the coming of the industrial revolution. Once great masses of workers were aggregated into factories, it was inevitable that they should form trade unions to protect and improve their standard of life; and the formation of similar bodies by their employers was equally inevitable. In England the movement ripened early; and the repeal of the combination laws in 1824-25 gave a general right to the formation of trade unions, subject, however, to serious limitations inherent in such other branches of the law as that of conspiracy.

In the United States the general right of association has similarly been gravely restricted in labor relations by the judicial interpretation of certain constitutional provisions, notably the Fourteenth Amendment, and by the use of the injunction against trade unions which seek the normal objectives of trade unionism. In France the right of industrial association was recognized before the general right of association and dates from 1884; Belgium legalized the right even earlier in 1866. In each case, however, the existence of the general right must be read in the context of individual guaranties of protection afforded by the constitution to citizens, which in the practise of the courts considerably affect a freedom of association seeking to be more than nominal in character. It should be added that in countries where, as in Russia and Italy, the government is a dictatorship no freedom of association either industrial or political exists save where the object of a body is approved by the dictatorship.

The necessity of preserving a special discipline in the military, naval and police forces of the modern state has presented a special problem and has usually been held to justify a limitation upon the right of those engaged in them to form associations at all or to form associations having organic contact with outside bodies or to withhold their labor without the fulfilment of a unilateral contract of service. It is usual also to prohibit civil servants from activities which involve any action of the first two categories; but they are usually although, as France and Germany show, not necessarily prohibited while in the service of the state from taking part in such political activities as might prejudice the neutrality of the corps to which they belong. In some countries, further, all strikes are forbidden; in others, as in Great Britain, workers engaged in particular forms of vital public utilities are debarred from the withdrawal of their labor without due notice.

In general during the course of the last century the right to hold public meetings freely has won a slow although by no means universal recognition. Sometimes, as in Great Britain and the United States, the holding of any meeting has been legal subject only to the maintenance of the public peace; and the observance of this right has then been a matter very largely dependent upon the character of police administration. In England indeed, perhaps the historic home of free assembly, a classic case [*Beatty v. Gillbanks*, 9 Q.B.D. 308 (1882)] established the

right of men to assemble freely even when it was known that their lawful intention would involve illegal acts on the part of opponents. In other countries the law has been less generous; and conditions such as obtaining previous permission from the police, confining the speeches made to a given language, limiting the age or character of the persons admitted, providing a list of speakers deemed satisfactory by the authorities and so on have been normally opposed. In the post-war period it is probable that the disturbed conditions of Europe have seen larger and more intense interference with freedom of assembly than in any other epoch since 1848.

The outstanding names in the history of the theory connected with freedom of association are those of Hobbes and Rousseau on one side and, although implicitly rather than explicitly, John Locke on the other. In his classic *Leviathan* Hobbes argued against any permission freely to form associations, on the ground, to use his homely metaphor, that corporations were "like worms within the entrails of a natural man." In his judgment they tended to detract from the allegiance men owe to the state and should therefore be rigorously discouraged. Rousseau took a similar view. Since for him the state embodied the general will which is by definition infallible, any lesser will must necessarily be inferior in quality and hurtful in action. He therefore urged the undesirability of associations on the ground that they interfere with the duty of the individual to give himself wholeheartedly to that general will which as embodied in the actions of the state represents his best interest. It was in accordance with Rousseau's doctrine that the French National Assembly had passed in 1791 the *Loi de Chapelier* prohibiting the existence of associations.

Locke took a different view. Whereas for both Hobbes and Rousseau the omniscient and organic character of the state was essential, for Locke its essence was that it should be both atomistic and limited in function to certain specified purposes. One of these was the maintenance of order; and he agreed that the state has the right of interference for this end. But his treatment of churches in the *Letter concerning Toleration* shows that in his view, so long as an association does not threaten the public peace, the state has no right to interfere with its activities. That view is the effective beginning of liberal doctrine on the subject; a view, it may be added, which has received support from men so varied as Voltaire and Adam Smith, Royer-

Collard, Guizot, Benjamin Constant and William Godwin.

As a matter of social philosophy it is clear that no state charged with the maintenance of social order can admit an unlimited right to freedom of association; for that would be to tolerate the existence of bodies actively engaged in an effort to seek its own overthrow by violence. It seems therefore that the legal limit of free association should not be held to be exceeded until the body concerned ceases to promote its ends peacefully. This is the implication of Mr. Justice Holmes' well known dissent in *Abrams v. United States* [250 U. S. 616 (1919)]. To illustrate: a government could hardly do otherwise than interfere with such a body as the Ulster Volunteers, who in 1913-14 announced their intention of resisting the application of the Home Rule Bill of that year by force of arms; who also engaged in military training and the purchase of military equipment to enable them to carry out their purpose. It is of course important that the government should have no power to judge the validity of their case; to confuse executive and judiciary in these crucial matters is to destroy the possibility of freedom.

It is difficult in the light of history to see that anything has been gained in the long run by multiplying prohibitions upon the right of association. Where men feel passionately upon some object they will combine to promote it; and any prohibition upon their effort to do so only serves to drive their activities into secret channels where their discovery is more difficult. It may well be argued, for example, that much of the violence of French and Russian history in the nineteenth century was due to exaggerated suppression of the right to form political associations; for men who cannot persuade a government to accept their view will seek sooner or later to impose it upon that government. Prohibitions do not seem to have any long run effect save that of exacerbating the temper of the disputants. For while it may be true that more cautious spirits will be driven by fear of the law to accept its prohibitions, that only leaves the association outlawed in the possession of more daring and desperate minds. The history of the revolutionary movement in Russia is a sufficient commentary upon this thesis.

Experience shows, however, that there is solid ground for limiting the right of association within the armed forces of the state and, although less decisively, controlling the political activities of their members. The history of France and Spain

shows clearly the grave damage that results from allowing the army and navy to play a large part in the disposition of political forces. In a lesser degree this is true of the civil service, although here it is fairly certain that a line can conveniently be drawn between civil servants engaged in the performance of important functions and those who may be regarded as no more than clerks who happen to serve the state rather than a private employer. The influence of the first class depends for its beneficial effect almost wholly upon public confidence in its neutrality; the influence of the second is no greater than that of any similar group of persons engaged in similar employment.

The modern state must decide upon three grave questions. How far does it propose to protect individual freedom of contract? How far does it propose, if at all, to limit the peaceful methods taken by industrial associations to advance their interests; for instance, does it propose to limit freedom to strike in vital public utilities? How far does it propose to declare illegal activities of industrial bodies which whether by reason of their purpose or their magnitude seek a change in the character of public policy; for example, a general strike to secure an eight-hour day in industry? To the first problem it may be said briefly that the modern state confronts a dilemma, since it is a commonplace in an industrial society that liberty of contract begins where equality of bargaining power begins; and it is just this equality of bargaining power that freedom of association seems alone able to secure. In any save the most newly settled areas the individual worker able to protect himself in an industrial sense is a sheer illusion.

In any case the answer to this, as to the other questions, depends upon a political philosophy in which wide variations of opinion exist. Men will reply to them in terms of the kind of society they effectively want; and their effective wants will in turn depend most largely upon the distribution of economic power in any given society. Freedom of association, in short, raises issues which go to the root of the modern state. Its realization is the very essence of liberty in any society. Without it no other freedom can have very much content. With it the maintenance over any lengthy period of a social order distinguished by inequality is a matter of grave difficulty. This only can be said with confidence, that liberty of association is most easily maintained where men are agreed about the kind of society they want. But to agree means as a rule

that they have an equal interest in the results of its operations. Where that result is for long unequal it is certain to be challenged. Such challenge is a threat to order; and in the effort to maintain it there are few governments prepared to allow freedom of association to continue.

FREEDOM OF CONTRACT is a doctrine which came into constitutional law late in the nineteenth century. In its name courts are called upon to declare invalid statutes regulating the conduct of business and setting bounds to its domain. It is the judicial expression of the independence of the economic order from the overlordship of the state. The phrase belongs to law; its meaning is an importation from common sense and from economic thought.

As the mediaeval order gave way before the impact of business and the machine process, an unplanned industrialism came into existence. Apart from the maintenance of legal institutions, such as property and contract, there was little chance for the exercise of formal social control. The opinion came to prevail that every man could protect himself through his right of contract, that the aggregate of terms of a multitude of bargains gave order to business activity and that industrial functions were best performed by being left to the interested parties. As business came to control industry, these popular notions were elaborated into an intellectual defense of its autonomy. The philosophers laid alternative foundations in natural rights and in utilitarianism; the economists constructed the theory of a

self-regulating industrial order; and the political thinkers formulated the practical philosophy of *laissez faire*.

So long as individualism was unquestioned, freedom of contract was a reality rather than a judicial doctrine. Its formal expression demanded an occasion for its assertion, a personnel of judges imbued with its spirit and legal categories to serve as receptacles for its thought. The occasion came in the second half of the nineteenth century—economic problems were discovered; exceptions were noted to *laissez faire*; and regulation began to be employed to put industrial matters to rights. If business was not to lose its integrity, an appeal had to be taken from the legislature to the judiciary; the higher law had to be invoked against statutes. To that end the economic theory of competition had to be converted into a doctrine of constitutional law.

The jurists of the eighties and nineties were ready for the constructive task. They had formulated their social theories just as an agrarian was becoming an industrial society. They had experienced individual bargaining, could attest the justice in letting each man look out for himself and were conscious of how America had prospered under its free institutions. They did not easily distinguish liberty and property, for liberty meant the opportunity to acquire property; they saw the emerging business community in terms of a pioneer society which was passing. The values of a frontier democracy were to the fore in their minds; to them one man was as good as another; a first principle of government was "equal rights to all and special privileges to none." Their own views were confirmed by the teachings of the classical economists and by the individualistic social theory of Herbert Spencer and of a William Graham Sumner who had not yet discovered the folk ways. They had begun the reading of law with Blackstone's *Commentaries*, in which the individual is the hero and the state the villain in the piece; sampled Coke's *Second Institute*, which was a by-product of revolt against authority; learned from Cooley the constitutional limitations upon government; and shared Maine's discovery of the cultural significance of the replacement of status by contract. At the time the study of social maladjustment was just beginning; analyses did not exist to oppose fact to theory and to make clear in detail and with evidence wherein the industrial system did not work. The process of mind, especially in judicial circles, was still the way of dialectic.

As separate exemplifications of the efficiency of checks and balances law, economics, politics and sociology were as one, and they were in accord with the prevailing common sense.

The American constitution offered no more than the raw materials. The best verbal bridge by which economic thought might pass into law was contract; but liberty of contract is to be found neither on the parchment nor in the minds of the framers of the document. The strategic word appears only in the provision denying sanction to laws "impairing the obligations of contract." In its stead liberty had to be made to serve. The word had once meant no more than a privilege; an exemption of a town from the king's law or the right of a feudal lord to levy toll upon passing traffic was a liberty. But in the English and American revolutions conscientious men had to appeal to a higher power to justify a revolt against authority, and liberty was freed from petty associations and glorified into an abstract right of man. There was appended to the constitution shortly after its adoption a provision that no person should be deprived of "life, liberty, or property without due process of law." A like injunction was imposed by the nation upon the states at the end of the Civil War; the state constitutions contain the same self-denying ordinance. A collocation of words so evasive and compelling was an excellent verbal receptacle for current sense and reason. Moreover, the usages of the constitution meant more than its clauses; it had been drawn up when men believed in the order of nature; it recognized inalienable rights which the government could neither deny nor abridge; it was regarded as the highest law of the land; the Supreme Court had been accepted as its official interpreter; and the people had been habituated to the declaration of the unconstitutionality of legislative acts.

Although it embodies the supreme law of the land the constitution is not insulated against prevailing common sense. Almost as early as the Civil War the state courts were asserting that man wanted no sanction in law for a natural right to bargain. By the eighties they were declaring statutes unconstitutional, even though they were unable to specify the prohibiting clause or to reduce their arguments to formal doctrine. The questionable acts took away natural rights; added adult males, able to take care of themselves, to the insane, lunatics and imbeciles, who made up the common law category of persons incompetent to contract; and con-

travened a law higher than that made by the legislature.

It took time, skill and even accident for the United States Supreme Court to convert a group of constitutional ideas into a judicial *laissez faire*. The due process clause of the Fifth Amendment endured an interpretative obscurity of three quarters of a century. The purpose of the Fourteenth Amendment was at first understood by the public and declared by the court to be the protection of the rights of the newly enfranchised blacks. Freedom of contract had to win its province; the field was in the possession of "the police power," which might be used to promote "public health, safety, and morals" and even "the general welfare." The justices who sat during the decades following the Civil War were not disposed to depart from traditional interpretation and were loath to override the will of erstwhile sovereign states. The police power, with the help of the concepts of "public interest" and "common carrier," was employed to give the regulation of public utilities a promising start [*Munn v. Illinois*, 94 U. S. 113 (1877)]. The police power was invoked to sanction the legislative grant of a monopoly in the slaughtering of livestock and again to sanction the legislative revocation of the grant. In the first case the argument that the grant of the monopoly denied to persons excluded "the right to a trade" and thus abridged "the privileges and immunities" of national citizenship was rejected by a majority of one [*Slaughter House Cases*, 16 Wallace 36 (1873)]. In the second case the minority shifted their base to the deprivation of liberty "without due process of law," argued not that the repeal was valid but that the original grant had been invalid, and concurred [*Butchers' Union Co. v. Crescent City Co.*, 111 U. S. 746 (1884)]. This opinion, often cited as if it had been official utterance, holds the germ of future law. But it was eighteen years after its adoption before the court invoked the Fourteenth Amendment to insure to a Chinese laundryman "the equal protection of the laws" and his right to a trade [*Yick Wo v. Hopkins*, 118 U. S. 356 (1886)]. In this period the men who did most to establish judicial veto were believers in the Declaration of Independence and opponents of privilege. They sought to keep the door open to personal opportunity.

As another generation of jurists came to the bench liberty of contract was discovered in the constitution. In 1886 the Supreme Court announced that a corporation was a "person"

within the intendment of the due process clause [*Santa Clara County v. Southern Pacific Railroad Co.*, 118 U. S. 394]. In 1890 it held that the opportunity to earn income is a right of "property," with which regulatory measures must come to terms [*Chicago, Milwaukee and St. Paul Railway Co. v. Minnesota*, 134 U. S. 418]. In 1897 it decided that "liberty" embraced "the right of the citizen . . . to live and work where he will; to earn his livelihood by any lawful calling, and for that purpose to enter into all contracts which may be proper, necessary, and essential" [*Allgeyer v. Louisiana*, 165 U. S. 578]. In 1908 it declared liberty of contract to be a property right. The carry over of a philosophy from a pioneer to an industrial society is evident in this proposition: "The right of a person to sell his labor upon such terms as he deems proper is, in its essence, the same as the right of the purchaser of labor to prescribe the conditions upon which he will accept such labor . . ." Current reason had found legal expression when the court declared: "In all such particulars the employer and the employé have equality of right, and any legislation that disturbs that equality is an arbitrary interference with the liberty of contract which no government can legally justify in a free land" [*Adair v. United States*, 208 U. S. 161]. The habitual use of such language imposed the legal label of "a deprivation of liberty" upon social legislation and extended protection against governmental interference from the individual to the corporation. But the justices who elevated freedom of contract to the dignity of a constitutional doctrine employed the borrowed language of economics as well as the native verbiage of the Bill of Rights. To them it was an instrument of general well being in a real, even if a vanishing, society.

The constitution brought to freedom of contract a new intellectual foundation: law speaks with authority; a principle laid down demands to be followed. After 1908 it was not necessary for justices, in its support, to argue expediency or to expound economic theory; it was enough to state the rule and to cite case and report. In its statement the practical ways of competition gave way to natural rights which demanded no apology. In "personal liberty" and in "private property," in fact "partaking of the nature of each," was "the right to make contracts for the acquisition of property." A disparity in bargaining power was an irrelevance; for it was "from the nature of things" impossible to uphold the rights without accepting as their "necessary"

corollary "inequalities in fortune" [*Coppage v. Kansas*, 236 U. S. 1 (1915)]. The "very purpose" of the constitution was "to prevent experimentation with the fundamental rights of the individual" [*Truax v. Corrigan*, 257 U. S. 312 (1921)]. The long catalogue of holdings through which a judgment of invalidity was passed upon a price fixing statute became "constitutional principles applied as they are written" [*Tyson and Brother v. Banton*, 273 U. S. 418 (1927)]. A powerful group in society did not want public interference with private business; a respectable body of opinion distrusted the capacity of the legislature for intelligent control. Thus, as freedom of contract shifted its ideological base, the collectivism called business passed into the province reserved as the rights of the individual.

It is impossible to indicate the scope of the doctrine by a catalogue of holdings. Freedom of contract and the police power together make up a formula of constitutionality. In its legal terms justices must strike the best balance they can between the social worth of laws and the inconveniences they impose. Judges are unlike in vision, experience and habit of mind, in regard for precedent and in response to current necessity. Their intellectual awareness ranges from an insistence that "the Constitution is not intended to embody a particular economic theory" [*Lochner v. New York*, 198 U. S. 45 (1905)] to an easy reading of personal views into its lines. Where values and interests clash over a period of years, no clear cut line can be drawn. Although the provisions in the state constitutions are worded almost alike, their local interpretations differ materially. The Supreme Court has vacillated in its devotion to the doctrine. From 1900 to 1916 social legislation had hard going; from 1916 to 1922 the fortunes of law broke rather evenly; from 1922 to 1930 rights were dominant and more statutes were pronounced null and void than in nearly half a century preceding; in 1930 a disposition to exalt freedom of legislation became evident. The legal basis for the regulation of railroads and public utilities was laid before the concept of property came to have judicial life, but due process has been used to justify judicial review of the acts of administrative commissions. The antitrust acts, in which contract in restraint of trade is forbidden, are an expression of the same economic theory that went into the constitutional doctrine. The zone between regulated monopoly and enforced competition has presented the great battle ground. Measures which manifestly promote health and safety,

such as the inspection of milk, the licensing of physicians, the limitation of hours of labor and the provision of work accident indemnity, have generally been upheld. Judicial disapproval has usually been visited upon statutes which fix price. In the name of public morals traffic in lottery tickets, alcoholic beverages and white slaves has been prohibited; an attempt to outlaw private employment agencies, as socially unnecessary, has been blocked by "the right to follow a distinctly useful calling in an upright way" [*Adams v. Tanner*, 244 U. S. 590 (1917)]. But a catalogue of instances makes hazardous even an approximate generalization. The decisions in favor of freedom of contract have usually come from a divided court attended by vigorous dissent. They serve as a very insecure basis for prediction.

The focus of criticism has been the judicial veto of statutes passed in the interests of consumers and laborers. Here the notion of a natural equality of men receives its most dramatic challenge from a society marked by great concentration of wealth and power. The large corporation produces soap, gasoline or textiles; it uses instruments of precision in devising the minimum standards of quality which vendibility makes necessary; it employs advertising and high pressure salesmanship to force its product upon an indifferent public. The consumer's mite of technical knowledge is crowded within a compact trade name; only if his personality is corporate can he match scientific test with scientific test and share in the terms of the bargain; his need is the exclusion of unworthy wares from the market. Yet statutes fixing the weight of loaves of bread, prohibiting the use of shoddy in manufacture and establishing standards of chemical composition for motor oils have been outlawed because of the buyer's ability to look out for himself.

The same impact of vested idea upon novel fact appears in a series of decisions restricting the use of the devices of trade unionism. Statutes prohibiting employers from discharging employees because of membership in labor organizations have been pronounced invalid; the employment of the secondary boycott in the unionization of a shop has been forbidden; the officials of a labor union have been enjoined from soliciting membership among working men bound by contract to remain non-union. None of these judgments came from a unanimous bench, and some state courts have refused to follow them. The laborer's lack of a choice was held to have nothing to

do with the case; in the prevailing view, if a man accepts a bargain because he possesses a family, must live and has no alternative, that is a matter of fact and not of law. In this way the courts have closed the doors to a judicial—and legislative—recognition of economic duress.

It is primarily freedom of contract which has given to the Supreme Court a place in the economic order. As modern industrialism reveals itself, there is an increasing resort to restrictive legislation. As the court separates valid from invalid statutes, it fixes the limits of the industrial province of government. Yet the Supreme Court is not an institution created for or adapted to the function of economic control. Its seat in Washington is far removed from the many localities where people must attend rather differently to their social problems; its personnel is fitted neither by profession nor by experience for the dominant role in the government of industry. Its way of decision is too steeped in reference to a text, deduction and *stare decisis* to be suited to an experimental task. It has no mechanism for gathering information upon economic maladjustment and the operation of corrective measures, and it lacks standards by which the relative merits of regulatory proposals may be tested. As a result judges are compelled to substitute a general tolerance of legislation or a personal preference for studied deliberation. In the absence of a reform in procedure the Supreme Court cannot act as an intelligent umpire in the continuing struggle between freedom of contract and the police power.

A chapter of judicial history still in the making may resolve the difficulty. The court as reconstituted in 1930 has subordinated liberty of contract and has rather consistently held social legislation valid. It has even, reversing a line of recent decisions declaring price fixing unconstitutional, held valid a statute regulating the commissions of insurance agents. In an opinion which leaves to the dissent the recitation of precedents the court announces a fitting procedure for the disposition of constitutional issues. No longer is "freedom of contract the rule" against which a specific statute must be proved a "proper exception" [*Adkins v. Children's Hospital*, 261 U. S. 525 (1923)]; instead, the statute is to be presumed to be valid, and the presumption is to be overcome only by a recitation of fact showing that the evil did not exist or that the legislative remedy was inappropriate [*O'Gorman and Young v. Hartford Insurance Co.*, 282 U. S. 251 (1931)]. A judgment upon the validity

of a legislative act has in the past been regarded as final; but the same bench has permitted the reconsideration, in the light of "experience," of statutes upon the constitutionality of which the court had already passed [*Abie State Bank v. Bryan*, 282 U. S. 765 (1931); *Missouri Pacific Railroad Co. v. Norwood*, 283 U. S. 249 (1931)]. The current commitment to factual inquiry and realistic test is none too secure; it has the support of a bare majority. But should it continue to prevail, the due process clause could be invoked only against specific statutes proved to be arbitrary. Then freedom of contract would become a concept of the second magnitude or disappear from the constitution.

Yet, even if a change in the personnel should give a new lease of life, the days of the doctrine seem numbered. A tribunal already overbusy with judicial work must guard its jurisdiction. As evidence of industrial maladjustment accumulates and an attempt is made to make industrial activity serve social well being, all of our agencies of control are likely to be employed. Already the restriction of production, once an unholy idea, has come to be thought of as essential to prosperity; and the reduction of cotton acreage and of output in oil are legislative matters. As opportunism drives us uncertainly toward getting basic industries in order, the state seems destined to have some sort of a role in national planning. The sheer volume of work will make it almost impossible for the Supreme Court to supervise the regulatory work of Congress and the state legislatures; nor could the courts that are to be make much of the current doctrine. Its intellectual foundations are becoming increasingly insecure. The way of the eighteenth century thought with its vocabulary of "liberty" and "property," of "natural law" and "individual right" no longer suffices for a statement of the problem of economic control. The problem of "the state and industry" does not present a choice between "restraint" and "freedom"; government and business are alike schemes of control whose compulsions we must obey and within whose arrangements we may do as we will. Social legislation is not an abridgment nor free enterprise a realization of "industrial liberty"; they are alike rules of the game of making a living, alike in being of human contrivance and subject to improvement. There is no escape from taking a chance upon the best control for industry which we can devise. Freedom of contract came into the constitution to serve the prevailing common sense; the concept must be

Freedom of Contract — Freedom of Speech and of the Press 455

refilled with current stuff of the mind—or cease to be a part of the supreme law of the land.

FREEDOM OF SPEECH AND OF THE PRESS. Freedom of speech derives its meaning from two sources. Through the centuries it bespeaks efforts to eliminate the varying restraints placed by government upon utterance. The changing restraints thus fashion a changing concept. But also during the latter seventeenth century—an age of rationalism and natural law—freedom of speech assumes the character of an ideal which, apart from particular restraints, is deemed of intrinsic merit to the progress of civilized life. In its first aspect it is primarily a rallying cry of minorities eager for expression. In its second it arrays itself as a philosophic truth to which history lends reality. Freedom of the press is an aspect of the larger freedom of speech, which since the invention of printing has presented its own peculiar problems.

The history of the struggle for free speech centers about the expression of ideas antagonistic to the existing religious, political or economic order. Greece presents an admixture of encouragement and restraint. Socrates' plea for the supremacy of the individual conscience and the public value of free discussion may be contrasted with Plato's demand for regimentation of thought. The Augustan age of Rome, careless of religious heterodoxy and social satire, was shortly followed by widespread prosecutions of

proselytizing Christians. The ascendancy of Christianity under Constantine brought the new religious heterodoxy under even severer penalties. The policy of proscribing the works of heterodox writers, begun by the Apostolic Constitutions and pushed with vigor by the Council of Niceae, culminated in the series of *indices librorum prohibitorum* that have issued from the papacy since 1559. The persecution of heterodoxy, a principle formulated by the high authority of St. Augustine, dominated Europe for centuries and created an atmosphere impossible to the freedom of expression. The Reformation shifted only the point and not the character of control. Calvin, Luther and the new English church were equally intolerant of heterodox expression.

What is termed the rise of humanism represents a period of appeal away from mere authority. Contest between philosophic truth and accepted faiths becomes inevitable and thus brings the issue of freedom of speech to the front. The effort to escape such an issue through the doctrine of the double truth—one philosophical, the other religious—as evolved by Averroes of necessity failed. In Catholic Europe until the eighteenth century the struggle for freedom of expression assumes a religious rather than a political complexion, freethinking in philosophy and science being challenged and punished as unorthodoxy. In England the growing participation of a wider public in government makes the issue, aside from the brief upheaval following the establishment of the English church, mainly a political one.

The idea of censorship is inapplicable to mere expression. Restraints upon freedom of mere speech must be achieved through punishment in the event that the bounds of the allowable liberty are passed. Censorship is applicable only when the necessity to use some means of communication affords an opportunity for government to intervene between the formulation of an idea and its expression. Restrictions upon freedom of expression are created by the offenses of libel and slander, obscenity, blasphemy and sedition. Their history is the latter day history of free speech. Together with censorship they portray the struggle for the freedom of the press.

Restrictions upon printing begin with the device of licensing and limiting the number of printers, printing being treated as a privilege to be pursued by grant from the crown. The bull of Alexander VI established censorship on a firm foundation in the Catholic world in 1502.

It was the recognized policy of England under Elizabeth. The strictness of the law of libel and sedition under the Tudor and Stuart monarchies, for a time severely enforced by the Star Chamber, stifled political criticism. It could voice itself only with difficulty through speech in Parliament and petitions addressed to the House for the redress of grievances. The punishment of blasphemy by the ecclesiastical courts, common law courts and the Star Chamber protected the tenets of the existing religion and tended to suppress publications of a freethinking nature. The Licensing Act of 1662 confirmed the principle of censoring the press. Its expiration in 1695 is commonly regarded as the beginning of the free press in England. But apart from ending the regime of censorship, years were to elapse before any significant latitude in the right of expression was acknowledged.

The eighteenth century marks the real struggle for freedom of expression. In England it is an era of large political moment, introducing a party system of government with an awake and vocal opposition. In France the era closes with revolution, and in America with the achievement of independence and the rise of a demand for liberty. Moreover, in the eighteenth century the newspaper begins to be an active agency in politics. Thus the century becomes an era of champions of freedom of speech and of the press. Milton anticipates it, but Locke, Voltaire, Rousseau, Wilkes, Paine, Camden, Erskine and Jefferson are of it, while Cobbett, Carlile and Mill carry on its issues.

The publication of news was originally regarded as criminal at common law unless done under the king's license. By 1700 this doctrine had disappeared, but publications of parliamentary debates were still punished as a contempt of Parliament. Edward Cave's attempt to report them in his *Gentlemen's Magazine* led in 1738 to his censure and his famous subterfuge of reporting their substance as debates in the empire of Lilliput. The next few decades saw them being reported in a more open manner as Parliament remained quiescent. Wilkes' bold attack in his *North Briton* (no. 45) in 1763 upon the Grenville government precipitated the issue of the extent to which government could be subjected to political criticism. The issue of free speech thus raised provoked the eloquence of Burke and the savage satire of Junius. Similar prosecutions, the chief of which were those of the publishers of Junius' letters and of Paine and his publishers, kept the issue bitterly alive. The

law of seditious libel, as expounded then by Lord Mansfield, left only the issue of publication to the jury, reserving the right to the judge to resolve the question of the libelous character of the publication. With judges mere tools of the crown, bitter political criticism was easily perverted into a libel upon the crown, the ministers or the constitution. The Fox Libel Act of 1792 altered the law to permit the jury to find both issues, but its importance as a practical remedy was for many years dulled by the deftness of prosecutors to select jurors of the requisite conservative political complexion. The thirty years following the French Revolution are marked in England by ministries fearful of acceding to the popular demands for political and economic reform and resorting to the suppression of criticism by severe and numerous prosecutions. Individual victories together with a change of ministry brought about the end of this era by 1832. Lord Campbell's Libel Act of 1843, which allowed truth as a defense to criminal libel, gave further scope to liberty of expression. With the abolition in 1855 of the "taxes on knowledge" or stamp duties on reading matter together with the repeal in 1869 of laws controlling newspaper publishers and printers through a burdensome and expensive system of registration, publication achieved release from onerous restrictions of long standing. Save for isolated acts of suppression, such as that of the Chartist agitation in 1839, freedom from prosecution for political criticism, even though of a violent nature, has characterized English polity for the past century. The achievement of freedom of speech and of the press, unlike other principles of English liberty, is hardly the product of legislative action. Perhaps as much a part of the constitution as any of them, its bases are individual victories over government tyranny resulting in a conviction of the inexpediency of setting political bounds to the right of discussion.

In France the dissemination of literature was controlled until the revolution by the licensing of printing and by strict censorship. Under such a regime the works of freethinkers, such as Voltaire, Rousseau, Raynal and the *encyclopédistes*, were banned. Freedom of expression was erected into one of the natural rights by the Declaration of the Rights of Man and the constitution of 1791. It survived, however, only a scant two years, and the policy of suppression through severe penalties and censorship was continued until 1828. Freedom of political expression in the daily press, however, begins to attain reality

only after the establishment of the Third Republic. Other European countries, following the outlines of the French methods, possess elaborate regulations dealing specifically with the press. The essence of control is through administrative regulation and the affixing of responsibility on managing editors. The regulations although detailed and superficially formidable do not, in the opinion of foreign observers, appreciably curtail the liberty of the press in normal times.

The American colonies began with restrictions upon freedom of expression akin to those of England. Puritanism in New England vigorously disapproved and persecuted religious heterodoxy. Religious toleration had a beginning in Rhode Island and a precarious foothold under the Baltimores in Maryland. But as in England the struggle for freedom of expression centered finally upon political rather than religious issues. Until about 1720 the licensing of printing and censorship of the press were maintained. The first American newspaper, *Publick Occurrences*, was promptly suppressed for want of a license in 1690. Although the records reveal prosecutions, the law of seditious libel had no such pervasive impact as in England. After 1763 the press in large measure supported the colonists in their contests with the crown. Attempts at suppression promptly allied the cause of a free press with the issue of independence. The ideals of Milton and Locke found a ready reception in the perturbed colonies, and the cause of Wilkes firm sympathy. Amid such stirrings the early constitutional bills of rights setting forth the freedom of speech and of the press were adopted. Beginning with Mason's Virginia Constitution of 1776 declarations of the right of freedom of expression found their way into other state constitutions. The Massachusetts constitution of 1778 failed of adoption because of its omission to include such a provision. Ratification of the federal constitution was impliedly conditioned upon the addition of a like guaranty, confirmed by the First Amendment (1791). The issue as to the import of this amendment, whether it simply forbade censorship or guaranteed a breadth of utterance akin to the rationalized ideals of Locke and Wilkes, became a justiciable one during the excitement of the World War. Judges have inclined to give it a narrower sweep than the historical evidence would seem to imply.

Under the constitution the issues of free speech have been dramatically raised on two

occasions. The Alien and Sedition laws of 1798, federalist measures engendered by fears of the spread of foreign revolutionary doctrine, punished severely writings defamatory of the government. The series of prosecutions although memorable was short lived. The laws expired with the Federalist party and indeed contributed largely to its wreckage; the prisoners were pardoned by Jefferson and reimbursed by Congress. The World War was productive of a not dissimilar experiment. Pro-Germanism, the teachings of the Russian Revolution, a distrust of the patriotism and economic outlook of the foreigner and widespread industrial unrest fanned the prevalent wartime spirit of intolerance. It produced the Espionage Act of 1917 and the Sedition Act of 1918, almost equal in severity to the Alien and Sedition laws, and with them a host of prosecutions for radical utterances. It revived a policy of expelling members from legislative bodies for the expression of ideas inimical to the more conservative patriots. In the schools it resulted in a mass of regulations governing subject matter, the manner of instruction and the professed beliefs of the teachers. It evolved the use of deportation as a means for ridding the country of alien radicals. It tolerated state trials in which the issue of radicalism tended to submerge those of the guilt or innocence of the accused. In the middle and far west a series of syndicalist statutes heavily punished the expression of ideas radically critical of the existing order. Against these restrictions resort was had to the constitution and the courts for vindication of the freedom of expression, but with scant success.

The World War and its aftermath of revolutionary doctrine have markedly affected the progress of freedom of speech. Countries theretofore dedicated to principles of extensive freedom have witnessed a series of suppressive measures reminiscent of earlier centuries. Economic heresy has been elevated to the rank of revolutionary doctrine. The post-war dictatorships in theory and practise jettisoned all principles of free speech. In Italy and Russia the strictest political censorship prevails and no opposition press exists. Such results naturally follow the rejection of the democratic idea, and the permanency of such a policy hinges upon the validity of that rejection.

The doctrine of free speech bases itself upon a conviction, fortified by experience, that "the best test of truth is the power of the thought to get itself accepted in the competition of the

market." No person or group is deemed wise enough to be trusted to discriminate between valid and invalid ideas. It recognizes that suppression of itself either tends to impart a factitious validity to the suppressed idea or that the idea, if valid, will survive such persecution. On the other hand, if opposition by speech is allowed, it will be impotent if the speech is mere fulmination; if the thought is valid it will effect the inevitable change in existing institutions by the non-disruptive process of conversion. But that the public safety demands that certain limits be set to the bounds of free speech is also recognized, premised upon the fact that for the moment "eloquence may set fire to reason." The problem lies in framing these limits as ultimate safeguards because of the tendency of legislators and judges, especially in times of stress, to regard ideas of which they disapprove as dangerous to the public welfare. In England the attempt to frame general limits was abandoned by the Campbell Committee in 1843, when it reported that "the limits of authorized discussion on political subjects are at present very undefined" but "from the mildness with which this branch of the Criminal Law has been administered . . . little practical inconvenience has been experienced from the arbitrary doctrines of past ages, though they have never been formally suspended." In the United States constitutional guaranties have necessitated the framing of limits beyond which the suppression of speech may not go. The First Amendment acts as a restraint upon national power, and in 1925 it was established that the liberty protected from state interference by the Fourteenth Amendment included freedom of expression. The test developed allowed government to penalize the use of words intended to create a clear and present danger of the happening of certain substantive evils that government may seek to prevent. As such the test is applicable both in peace and war, but war enhances the power by entitling government to regard as dangers matters beyond its ordinary peacetime jurisdiction. The test is a shadowy one, in which proximity and degree allow indefinite play for the emotions of varying judges. A significant contribution in further defining its nature was made separately in 1927 by Justice Brandeis, who insisted that the incidence of the evil apprehended by the words used must be so imminent that it might befall before there is opportunity for full discussion.

Speech offensive to religious and social morals presents still another problem. Both England

and the United States present the anachronistic spectacle of retaining upon their statute books blasphemy acts long antedating the period of religious liberty. In both, the statutes, although nominally dead, have been employed in sporadic instances to make criminal the use of language less blasphemous than critical of existing social institutions. The circulation of obscene publications is penalized by the criminal laws by barring them from the mails and by forbidding importation. In some cities a virtual censorship is exercised through threats of prosecution by states' attorneys, assisted by unofficial societies for the suppression of vice. Again the issue of the standard of obscenity raises crucial problems. Many recognized classics have been or are still under the ban of such regulations, as their administration tends to fall into the hands of officials incompetent to discriminate between literature and salacity.

Extralegal controls over the publication of news as well as opinion are again a natural outcome of a press organized upon the same basis as giant industry. Financial and political pressure not only colors current reporting but closes the avenue of expression to undesired ideas. The World War's demonstration of the power of organized propaganda brought in its wake the use of similar mechanisms for the promotion of private ends. Such factors tend to transform the struggle for the freedom of the press into one for its independence.

FREEDOM OF THE SEAS, as a term of international law and politics, has accumulated through three thousand years of usage a rich and varied content. It has come to refer, first, to navigation, fishing and indirectly to trade on the high seas and in coastal waters, if not on inter-oceanic canals and international rivers, in time of peace; and, second, to similar activities on the part of both neutral and belligerent vessels, naval or mercantile, in time of war as well as to the conduct of naval hostilities themselves. At different times different aspects of the question appear to constitute the whole problem of the freedom of the seas, but neither of the two main aspects of the problem may be regarded as entirely settled.

During antiquity various efforts were made by piratical individuals and groups as well as by Greek and Roman governments to close or open various portions of the Mediterranean basin; these activities were vigorously discussed in the political life and the literature of the time. During the Middle Ages Venice, Genoa, Spain and England put forward claims to territorial sovereignty over various portions of the Mediterranean, the Atlantic Ocean and the narrow seas of northern Europe; such claims seem to have

been acknowledged from time to time by navigators of various nations and by their governments. At the end of the fifteenth century, however, the claims began to be denied. Grotius' *Mare liberum* of 1609 marks the culmination although not the ultimate triumph of this denial; the last great assertion of the case for *dominium maris* was made by the Englishman John Selden in his magistral work *Mare clausum* (1635).

On the other hand, the wartime phases of the question had begun to grow in importance from the fifteenth century onward, and by the beginning of the nineteenth century assertions of neutral rights and of belligerent rights of visit and search, blockade, capture for carriage of contraband, and unneutral service had taken the place occupied two centuries before by the other aspect of the problem. In proportion as neutral rights were extended and respected a greater freedom at sea was provided; in proportion as belligerent rights of blockade and capture for carriage of contraband were extended that freedom was restricted—at least for the neutral. These controversies continued until 1914 along with persistent discussion of modern versions of the problem of territorial waters—marginal belts, gulfs and bays, straits and other questions. During the World War the conflict between neutrals and belligerents became very acute and revived discussion of the freedom of the seas. Since that time the question has been allowed to slumber except for some discussion of smuggling.

The national interests at stake in these various questions are numerous. In earlier days governments and individuals and trading companies desired opportunities for exploration, colonizing activities and trade or desired to prevent such activities on the part of rivals; monopolistic schemes of colonial trade reenforced these desires. Later the dominant naval power—such as Great Britain—came to demand recognition of its rights: at first to maritime dominion and, later, apart from any claims to territorial jurisdiction over the sea, against trade calculated to aid its enemies in time of war. Smaller naval powers, shipping nations and neutrals have demanded freedom from such authority; the United States belongs traditionally to this group and went to war over the question with France in 1798, with Great Britain in 1812 and with Germany in 1917. Today these same interests impel the various nations to oppose or advocate naval disarmament.

International law has registered the net results of the conflicts and controversies just mentioned

with greater or less exactitude and clarity, depending upon the state of the science of the law and also the state of the art of international government. Prior to 1500 no science of international law existed to register prevailing practise and agreement upon the subject. In the next three hundred years the students of international practise (Gentilis, Grotius, Selden, Bynkershoek and others) succeeded in discovering and setting forth the law to a certain extent, but international legislation and adjudication upon the question was still lacking. Beginning in 1800 the science of maritime law grew considerably and the law itself was developed not merely by practise but by international treaty agreements many in number and extensive in scope.

With regard to the wartime aspect of the problem the high water mark in international legislation was thought to have been reached in 1909 in the Declaration of London, which purported to complete and perfect certain Hague conventions of 1907 and thus bring to a close many previous controversies regarding belligerent and neutral rights—mostly to the benefit of the neutrals. Unfortunately for this view the Declaration was never ratified and the Hague conventions also lacked support in some quarters. This situation, coupled with the appearance of the submarine and the airship, new scientific and industrial processes and government control of industry and trade in belligerent countries, rendered the older rules of maritime war and neutrality somewhat obsolete. The preexisting law was rather freely disregarded during the World War and no effort has been made since that time to redefine the rules. Indeed, the problem has been carefully—and wisely—avoided by responsible statesmen on several occasions.

The future of the problem must be affected by several factors. A nation's freedom on the seas and its share in the writing of sea law defining that freedom depend upon its ability to match the naval power of rival nations or upon its opportunity to share in the benefits of action by the international community intended to control the dominant naval powers and write a just law of the sea. It is the former alternative which in large part lies back of the rivalry in naval armaments which led to the conferences in Washington in 1921–22, Geneva in 1927 and London in 1930. The rise of the United States to a position of naval parity with Great Britain enables her to demand maritime rights which in the past she could never be sure of obtaining, although

whether she will make such demands depends upon various factors. Franco-Italian naval rivalry in the Mediterranean, on the other hand, is not so much a struggle for relative influence in writing maritime or prize law defining the freedom of the sea as for sheer physical dominance in terms of potential naval combat. No attempt to rewrite the law of maritime war today could succeed in view of the technological factors as well as political factors such as the disarmed position of Germany and the pacifist opposition to any recognition of a "law of war." Any such attempt could be productive only of harmful controversy, although neglect or inability to revise the prize law of 1914 will result in unlimited confusion and controversy if war does break out again among the maritime powers.

Finally, much depends upon the possible development and actual use of international government, particularly international sanctions. The peacetime aspect of the problem will persist, of course, as long as nations are nations. And mere limitation or reduction of armaments can have no effect in regard to wartime freedom of the seas until reduction reaches a point rendering belligerent power over neutral shipping negligible and inequalities among naval strengths unimportant, a point not likely to be reached very soon. Elimination of war by renunciation or any other method would remove one whole branch of the problem at a stroke, but if elimination of war is to be accomplished by a system of sanctions or if a system of international military sanctions is ever accepted and invoked for this or any other purpose, the whole problem is altered and reopened in new form. A League which closed the seas as a police measure would destroy freedom at sea even though the surrender of freedom was voluntary on the part of the participating nations. The United States by remaining out of the League and insisting—prospectively—on its neutral rights has threatened to nullify any such League action; the British dominions and Great Britain herself, in part because of the attitude of the United States but also because of a reluctance to serve as policeman of the Europe of 1919, have taken a similar position. If, on the other hand, the United States abandons the neutral position in order to help maintain peace under the Briand-Kellogg Peace Pact she must thereby voluntarily surrender her cherished freedom of the seas. How much maritime freedom any one nation will be able to enjoy in the future is thus likely to depend not merely as heretofore on its own power but

largely upon its relation to the League and to organized sanctions of international peace and order—in other words, upon the establishment and working of international government. In the absence of such developments freedom at sea for most nations will depend as always on the moderation of the great naval powers in writing and enforcing the maritime law of peace and war or in exercising their power at sea without law.

FREEHOLD when used originally in English law designated an interest in land held by a free-man by a free tenure; in more modern times it has signified an interest in land for an indefinite period of time. The distinction between free and unfree tenure is historical rather than logical, the former comprising non-servile estates which in quantity were neither tenancies at will nor for terms of years. In England by the thirteenth century the distinction became hard and fast. The real actions of the king's courts for the protection of seisin were given only to those who were seised of a free tenement. Between free and unfree tenures it was often necessary to draw a fine and somewhat arbitrary line.

In Bracton's day the free tenures were of four types: frankalmoign, military service, serjeanty and free socage. Frankalmoign was an exceptionally privileged tenure by which religious persons or bodies held land but without any obligation of fealty. Such services as may have been due were religious in character, enforceable by spiritual censures. Since one of the characteristics of this tenure came to be the absence of any obligation to perform secular services, it has been looked upon as the type of freehold tenure most closely approximating free ownership. While in the twelfth century jurisdiction over frankalmoign land had belonged to the ecclesiastical

courts, in the thirteenth this supervisory control was assumed by the king's courts through the development of the assize of utrum. Two statutes of the period, of Mortmain (1279) and *Quia emptores* (1290), diminished the importance of frankalmoign and brought about its obsolescence, the former by prohibiting all sales or gifts of land to religious houses without the king's license and the latter by preventing subinfeudation and by providing that in grants in fee simple the religious house should hold of the lord paramount by fealty.

Military tenure or knight service was introduced into England by the Norman kings, who enfeoffed their followers with sizable tracts of land and obliged them to perform in return a certain amount of military service. According to Round the unit of the feudal host was the Norman *constabularia* of ten knights, and the number of knights due under military tenure was generally some multiple of this figure. The minimum unit for military purposes was known as the knight's fee; while varying greatly in size it was normally about four hides, or 480 acres. Under active military feudalism knight service was the typical feudal holding; but the Angevin rulers preferred a paid army as more effective in coping with baronial disorder and encouraged the commutation of military services for a money payment, which came to be known as scutage. Commutation, which soon became a fixture, permeated the entire military hierarchy, extending to the services due from the subvassals. When in the fourteenth century Parliament assumed control over scutage, military tenure was no longer a source of either soldiers or pay but was distinguished merely in the revenue provided in such feudal incidents as wardship and marriage. Scutage and the incidents of knight service were formally abolished by statute in 1660, when military tenure was converted into free and common socage.

Serjeanty was the type of freehold tenure requiring personal services. Serjeanty indeed meant service. The services might range from the duties of the royal household, positions of great dignity, to obligations to perform military services or to furnish military supplies. A tenure held directly from the king for personal service was called a grand serjeanty. Any other was a petit serjeanty. The serjeanties performed by the nobility came to be considered similar to tenure by knight service and the smaller military serjeanties virtually socage tenure. When in the fourteenth century the practise developed of

substituting contracts with hired services for the tenancy by serjeanty, the employment of this tenure to secure the performance of a great mass of small official duties gradually declined in popularity. Serjeanty, however, has not succumbed entirely; in England it has sturdily survived the sweeping land reforms not only of 1660 but also of 1922.

Socage was the great residuary tenure for all freeholds which were not held in frankalmoign, by knight service or by serjeanty. The term evolved from an expression used in Anglo-Saxon charters to concede jurisdictional rights. In the eleventh century socage was the tenure of the socman, or the peasant proprietor, but with time came to be less and less identified with a distinct social class. The relationship of tenure and status was a source of much confusion in the Middle Ages. While status was defined earlier, it did not determine tenure and gradually lost much of its significance as tenurial relations developed. The freemen of Domesday are not necessarily freeholders; for although only a freeman could hold in free tenure, servile lands were frequently held by freemen. Just as with the advance of the Middle Ages the tenants in military tenure were no longer knights in practice, so those holding in socage were not necessarily to be considered humble socmen but might come from a much higher social and economic station.

As opposed to spiritual, military and serviential tenure socage was essentially economic and specifically agrarian. The services due were indefinite: in some cases they were merely nominal—a pound of pepper or a rose annually; in others a substantial rent might be fixed. In addition, the charter might provide that certain labor services be performed on the lord's land, and to fulfil the obligation the tenant frequently employed subvassals. In the fourteenth and fifteenth centuries it became customary for the fixed manorial dues in kind to be commuted into money payments. The more indefinite obligations of free socage gradually disappeared and the modern economic rent paying freehold evolved. Socage tenure owed its increasing popularity to the desire of military tenants to rid themselves of such oppressive mediaeval incidents of their holdings as military services and scutage and the even more persistent incidents of wardship and marriage. Least encumbered by troublesome feudal obligations, socage gradually superseded other forms of freehold tenure.

The line separating the manorial tenants in

villinage from their neighbors holding in fee was often a very shadowy one. Where the labor services were uncertain or where such services were exacted as the merchet—the payment for leave to give one's daughter in marriage or to send one's son to school—the court would hold that villein tenure was indicated and would deny the legal remedies available in free socage. The social distinction was even more subtle than the legal, for both the freeholders of moderate estate and the substantial customary tenants have generally been placed in the same category of yeomen with common social and economic interests.

At common law freehold tenures descended according to the rule of primogeniture. This and other customs entrenched in feudalism were not, however, universally applicable to free and common socage. In commercial regions such as Kent, where manorial husbandry apparently did not make important inroads and where money payments were generally preferred to feudal dues, certain customs antedating the common law survived until modern times. These are grouped under the general term gavelkind, associated with the old English word *gafol*, signifying rent or a customary performance of agricultural services. Among the most notable of these customs was the one providing that land descended equally to all the sons. There was no villenage in Kent, nor did land escheat for felony. The New England colonists in deference to these customs and in the belief that their charters introduced the special socage tenure of Kent transplanted it to America but reserved a double portion of the succession to the eldest son out of respect for the Old Testament precedent. Other customary rules different from the common law grew up in many of the boroughs. While partible descent was the rule, in some there existed the custom known as borough English, providing descent to the youngest son, probably on the ground that he was least able to care for himself. Both gavelkind and borough English have been abolished by modern statutes. Burgage tenure has often been described as but a form of socage tenure in the towns; but the former possessed far greater mobility and was distinguished by a freedom of devise.

The incidents of the free tenures were feudal in origin. The tenant became his lord's man by doing homage and swearing fealty in a solemn ceremony. Homage implied a reciprocal obligation; and with the breakdown of feudal jurisdiction it spread to all the free tenures in the modern guise of the covenant of warranty. The

relief, or the sum paid by the heir to the lord for permission to succeed to his ancestor's property, gradually extended from knight service to all freehold tenures, and the amounts due were soon fixed. Of great pecuniary value both to the king and the barons were the incidents of wardship and marriage which attached to knight service and grand serjeanty. The sons and heirs of the military tenants together with their estates were in the custody of the lord until majority. The lord also possessed the power of disposing of the female ward in marriage, of collecting a fine for an unlicensed espousal and of assessing a penalty where the ward declined the match proposed by the lord. With the gradual obsolescence of subvassalage as a result of the operation of the statute *Quia emptores*, wardship and marriage tended to become exclusively royal rights and were abolished in 1660. In addition, a lord had the right to call upon his tenant to help in certain emergencies, specifically defined in Magna Carta as the ransoming of the lord's person, the knight-ing of his eldest son and the marriage of his eldest daughter. These "aids" were likewise abolished in 1660. Furthermore, the tenant was bound to appear as an assessor in the lord's feudal court of justice. Since all feudal land is conceived to be held of some suzerain, if the tenant of a fee simple estate died without heirs or committed a felony his land escheated, or reverted, to the landlord. Finally, as an incident of feudal tenure various restrictions were imposed upon alienation in the form of fines. Prior to 1290 a vassal could alienate his land either by subinfeudation or substitution. As a result of the statute *Quia emptores* the latter method alone was legalized. Shortly thereafter it was settled that the lord could not charge a fine upon alienation in an attempt to evade the statute. The result was free alienation by substitution, but the depreciation of the incidents of escheat, wardship and marriage was halted. With the rapid disappearance of military service and the change in the money rates which brought about a decline in the value of rents due from socage tenants, the burdens imposed by such of these freehold incidents as were not abolished became appreciably lighter. Suit and service in the feudal courts disappeared when the judicial functions of these bodies fell into desuetude. With the enlarged power of testamentary disposition escheat for lack of heirs has become a rare occurrence, while escheat for felony is no longer enforced by law.

As a result of modern legislation the freehold

has been modified and simplicity substituted for complexity. Practically all tenure is now socage tenure. Knight service was converted into socage by the Statute of Tenures in 1660 (12 Chas. II, c. 24) and the remains of copyhold, originally the tenure of the unfree tenants, was similarly treated under the Law of Property Act of 1922 (12 and 13 Geo. V, c. 16). In England today the only survivors of this assimilative process are frankalmoign and the services attached to grand and petit serjeanty.

In England in the later Middle Ages the freeholders constituted an influential social and political group. In Domesday they comprised a very small percentage of the total population and less than 30 percent of the landed tenantry, and it is this minority whose rights and privileges were safeguarded in Magna Carta. According to the estimates of Tawney the freeholders of the sixteenth century comprised about one fifth of the landholding population, the customary tenants nearly two thirds and the leaseholders between one eighth and one ninth. While the substitution of large pastoral estates for small agricultural farms rapidly undermined the economic position of the customary tenant in this period of enclosures, the freeholder's well-being was increasing. The vast majority of landholders were socage tenants whose payments were fixed. With the fall in the value of money this fixed rent yielded a small income to the manorial lord, and in many cases the payments disappeared entirely by the end of the century. At the same time the rise in prices increased the freeholder's income. For two centuries longer the freeholders withstood rack rent and eviction, to which leaseholders and copyholders were subject. In this period the only way to eliminate them was to buy them out, an unusual procedure. The eighteenth century marked the beginning of the end. The enclosures of this period pitifully thinned their ranks and drove them from the villages or compelled them to stay as laborers on the verge of poverty. In modern times the tenant farmer and the agricultural laborer have largely supplanted the freeholder in the agricultural life of England.

The mediaeval common law was careful to restrict its rights and privileges to the *liber homo*, or freeholder. This distinction between freeholder and villein was clearly brought out in Magna Carta, which excluded the latter from most of its broad benefits. At times *liber homo* was used to signify a landowner with a manorial court—in other words, a large feudal tenant.

Only gradually did the servile tenants come to share with the freeholders a substantial portion of their rights at private law. In mediaeval England property qualifications determined attendance at the county court and service on juries, although many villeins were likewise obliged to serve in leet, tourn and hundred court and to act as jurors. It seems likely that in the first two centuries of parliamentary representation the knights of the shire were elected by the freemen of the respective counties. With the decline of the business of the county court attendance was not generally representative and frequently elections fell into the hands of the sheriff and a small clique. In 1430 an act (8 Hen. vi, c. 7) was passed which determined the county franchise for four hundred years, limiting its exercise to residents possessing a freehold worth forty shillings a year, this being also the qualification of a juror. This act does not seem to have effected a social revolution or to have altered the character of representation in the mediaeval Parliament. In the course of time the qualification was extended to include annuities, rent charges and leases for life in addition to realty. The decline in the value of the shilling was counterbalanced in part by the shrinkage in the number of freeholders in the eighteenth century. As a consequence Parliament down to the nineteenth century was controlled by the substantial landed interests, and the freeholders, being brought into working alliance with the gentry, represented a political interest which was frequently at cross purposes with the common economic interests of freeholder and villein. The freehold was not the exclusive test for the suffrage franchise in boroughs and corporations, where the suffrage might extend to householders, to a restricted group of landowners or to pot-wallopers—persons furnishing their own diet.

Tenure in free and common socage was generally established in the English colonies in America by the colonial charters. In some colonies, such as New York and Maryland, where manorial systems existed, this tenure appeared in somewhat more feudalized form than in New England. Feudal services were generally limited to the reservation of a specific quit rent; but during and after the War of Independence most feudal incidents, including quit rents, were abolished by statute and a fee simple was vested in the freehold tenant. Feudal incidents were not extended to the states of the Northwest Territory. Where socage tenure does exist it partakes of the essential qualities of alodial, or non-

feudal, estates. In New York, for example, estates of inheritance and for life are still termed estates of freehold, and the former are regarded as fees simple. Today the holding of such an estate is marked by the absence of all feudal incidents with the exception of escheat to the sovereign, and the owner has the fullest powers of legal disposition over his land.

In America a great impetus to the creation of a large freeholding class was the opening of the public domain to settlers at the beginning of the federal era. As a result of the land acts of 1800 to 1820 the economy of the west rested mainly upon a system of freehold farms. This process was greatly facilitated by three great enactments during the Civil War: the Homestead Act, the Morrill Land Grant Act and the Union and Central Pacific grant, as a result of which small freeholders secured a great portion of the new tillable lands.

The purely arbitrary English suffrage qualification was extended to the American colonies, where it underwent minor modification. By the eighteenth century the property qualification was universal in the colonies. A minimum freehold estate of forty shillings obtained in New England and much higher requirements in numerous other colonies, where the freehold was often expressed in acreage rather than in value or income. At the close of the colonial period six colonies had alternatives to the real estate qualification in the form of holdings of personality or the payment of taxes. With the growth of the commercial interests in England and America sentiment rapidly favored the substitution of a general property qualification for the realty requirement. Although the liberalization of the suffrage took place first in the United States, general property or tax paying qualifications still exist in several states. The substitution of a general property qualification in place of the freehold was not effected in England until the Reform Bill of 1832, according to which the holdings of copyhold land or leasehold of a stated yearly value were made additional qualifications, and the stated values were substantially reduced in the suffrage acts of 1867 and 1884. Twentieth century reforms have swept away the last property qualifications in England.

FREEMAN, EDWARD AUGUSTUS (1823–92), English historian. After receiving his university degree at Oxford Freeman spent the remainder of a long life in the study of political history, topography and architecture. In addition, he was a voluminous contributor to periodicals, especially the *Saturday Review* and the *Fortnightly Review*. The greatest of his historical works is a *History of the Norman Conquest* (6 vols., Oxford 1867–79; vols. i–ii, rev. ed. 1870). This monumental achievement supplemented by two additional volumes on *The Reign of William Rufus* (Oxford 1882) gave him a secure place among English historians and largely led to his appointment in 1884 as regius professor of modern history at Oxford. The last years of his life were spent on an incomplete *History of Sicily* (4 vols., Oxford 1891–94).

The central point of Freeman's conception was the "unity of history." He deplored the effect of the revival of learning in so far as it made classical times the object of an almost exclusive idolatry. He urged that all distinctions of ancient and modern be thrown away: "European history from its first glimmerings to our own day is one unbroken drama." To Freeman the great unifying element in history was Rome, "the true Eternal City." This accounts for his deep interest in Sicily, the "ecumenical island," where diverse civilizations had met and struggled.

Freeman's conception of the unity of history was largely confined to its political aspect, as expressed in his well known dictum, "History is past politics, and politics is present history." He had little interest in any art save architec-

ture and but slight concern with the industrial, social and religious activities of the past. He cared little for the times subsequent to the eleventh century nor did his "unity" comprehend other than southern and western European development.

Possibly his greatest contribution to modern historical method in England was a constant emphasis of the study of sources. Yet here again he seemed to fall short of his ideal, since he was ignorant of palaeography and refused to work with anything but printed sources. His slavery to exactitude was so unrelenting that within the range of his political interests he was remarkably accurate, although tending to be prolix in his transcription of chronicles. Freeman's account of the Norman invasion has been much criticized; on account of his partiality for things Teutonic he found the conquest to be but a foreign infusion that was speedily absorbed. To Freeman the great hero of eleventh century England was Harold, not William. The very bulk of his writings, the thoroughness and honesty of his craftsmanship and the widening horizon that he opened to historical students account for his conspicuous place among the historians of his day.

FREEMASONS. *See* MASONRY.

FREETHINKERS. Free or autonomous thought is the contrary of thought, research, science and philosophy fettered by the dogmas and principles of religion. Free thought recognizes no restriction but that imposed upon its progress by the rules of logic, scientific methodology and epistemology.

The term freethinkers, translated *franc-pensants* by Voltaire, was first used in England in the eighteenth century and was applied to those trusting to the guidance of their own intelligence in all moral and religious questions and rejecting all belief in external revelation, inspired Scriptures and the supernatural authority of the church. It was used in 1711 by Lord Shaftesbury, who calls the freethinker "the noblest of

characters" (*Characteristics*, 2 vols., ed. by J. M. Robertson, London 1900, vol. ii, p. 349), and especially by Anthony Collins in *A Discourse of Freethinking Occasioned by the Rise and Growth of a Sect Call'd Freethinkers* (London 1713).

Man is indebted to the genius of the Greek, the least priest ridden, most artistic, most intellectual people in history, for the development of what freedom of thought exists in the modern world. The *De rerum natura* of Lucretius, a thoroughly Hellenized Roman, imbued with the teaching of Epicurus, is a magnificent attack on supernaturalism, "a paean in hexameters to the spirit of rationalism." Epicurean and other Greek influences are responsible for the spirit pervading the fatalistic and pessimistic yet hedonist atheism apparent in the authentic part of the Hebrew book of *Ecclesiastes*. It was the narcotic influence of oriental religious speculation on the later development of Hellenistic culture in the Roman Empire that gradually refastened the old fetters on the activities of human intelligence. The attempts of writers like Severianus of Gabala, Mar Abba of Nisibis, and Cosmas Indicopleustes to discredit the Ptolemaic system in favor of the Biblical cosmology are typical examples of the same tendency which centuries later led to the condemnation by the church of Galileo's renovation of the heliocentric system of Aristarchus of Samos. The practise of astrology and the survival of the stoic belief in astral fatalism saved the remains of ancient cosmological science from total oblivion in the Christianized Roman Empire.

To a greater extent than on the western soil, desiccated under the influence of arid Roman political utilitarianism, Greek science continued to thrive in the eastern regions in the sphere of that half Hellenistic, half Iranian culture which succeeded in permeating the orthodox Islam of the Arabic conquerors. No freethinker of any country—not excepting Voltaire—is more celebrated in the English speaking countries than Omar Khayyám, the "highpriest of free-thought and agnostic pessimism." The works of Arabic philosophers like al-Kindi and Averroes which were leveled against the futilities of theological speculation were fiercely attacked by the mediaeval defenders of Christian orthodoxy. Spain governed by an Arabic dynasty and Jews grown wealthy and cultured under Saracen rule preserved the sparks of the unextinguishable Greek fire of learning and science from being permanently buried under the ashes of scholasticism. The history of the translation of Greek scientific

and philosophic literature into Arabic and into Latin (either directly or through the medium of Hebrew) is the history of the survival and diffusion of free thought during the Middle Ages. The humanists by their scientific study of the original texts of the Scriptures gradually brought about the fatal conflict between the traditional authoritative interpretation and a new, free, more or less scientific philological interpretation and thus a clash between personal and institutional religion. The Protestant revolt, although not in itself immediately concerned with the question of free thought, by its accentuation of multiplicity and variety in religious beliefs and practises eventually called forth the need for the existence of freedom of thought and conscience.

Modern philosophic speculation concerning free thought finds its first most important representatives in Hobbes, who in his *Leviathan* contended against the "captivity of the understanding," and in Spinoza, who in his *Tractatus theologico-politicus* devoted a whole chapter to the demonstration of man's "natural right freely to think what he likes and to say what he thinks." Spinoza's conception of man's natural right to free thought was strongly influenced by the revival of Greek sophistic and cynic speculation about natural right (*jus*) as opposed to historic, written or traditional law (*lex*), which was initiated by Hugo Grotius. This philosophic speculation culminated in the formal Declaration of the Rights of Man of the French Constituent Assembly in 1789, which enjoined that "no one is to be interfered with on account of his opinions, even on the subject of religion, so long as their manifestation does not disturb public order as established by law." This doctrine Pope Pius VI immediately declared to be a monstrous and mad law destroying reason itself, but it was taken over into the constitutions of the United States and other republican states.

In modern France and Italy free thought has always been associated with democratic and revolutionary activities. The remarkable development in eighteenth century France of what Aulard and Augustin Cochin have called *les sociétés de pensée*—thinking, or more exactly freethinking, associations—was one of the chief instruments for the diffusion of both free thought and democratic ideas. Not in vain had Voltaire suggested to the disciples of Enlightenment that they form friendly groups, dine together regularly for the purpose of discussion and mutual information of the faithful and carry on a steady correspondence with similar groups, resuscitat-

ing in this way the political *hetaireiai* of Athens, the philosophic order of the Pythagoreans and the symposia of the Platonic Academy. It is hardly an exaggeration to say with Cochin that a direct line of evolution leads from the enlightened drawing rooms in which Voltaire shone over the Academy of Moral and Political Sciences of Condorcet to the terrorist clubs of the Jacobins.

Except for the humanistic academies of the Italian Renaissance and their various imitations in Germany and other countries and such bodies as the English Royal Society, the world had not known until the eighteenth century any societies organized for collective thinking and discussion. There had been religious sects, guilds of merchants and artisans, colleges of doctors and parliaments of lawyers; but there had never been, in spite of many projects and abortive organizations of people like Comenius, Andreae and Jung, anything like societies, let alone a whole network of societies, for the avowed purpose of collective thinking and talking. It is the century of Enlightenment and the classicist intellectual movement, called by its enemies the heresy of philosophism, which started the beginnings of that vast movement. Throughout the country in each rural market place and town there were organized *cabinets de lecture* (public reading rooms), in which people met in order to talk, to read the various papers or occasionally a booklet about the new philosophic, political and economic ideas of incipient liberalism. Even more significant were the numerous local academies and more or less secret debating clubs (*sociétés populaires* or *sociétés patriotiques*), which provided a public for the rhetorician of the day even as the reading rooms provided a public for the philosophic writers. These freethinking societies between 1750 and 1780 had a deep and lasting influence on the spirit of the French countryside and market town. The superficial apothecary's and medical practitioner's materialism, which Flaubert has so vividly portrayed in the celebrated character of Homais in *Madame Bovary*, and the radical anticlericalism of the modern French provincial middle class and peasantry were created by these *sociétés de pensée*, which had no counterpart anywhere in Europe. There has been no other epoch in which pagan Greek philosophy, Socratic, cynic and stoic rationalist ethics, the religion of Socrates, Cicero and Marcus Aurelius together with the classic ideals of the direct, rhetorical democracy of the Athenian agora and the Roman forum

and the Platonic utopianism of the best possible state were popularized to such an extent. "Tribunes" of the people in classic costume taught the yokels the constitutional rights which they were to claim in the ideal state, and country parsons began to officiate as "chief pontiffs of the *Temple de la Patrie*" trying to transform their traditionalist easy going Catholicism into the rhetorico-philosophical deist "Cult of the Supreme Being."

The leading Thermidorians and the leaders in the Directory, the Consulate and the empire were freethinkers almost to a man; every regiment of Napoleon's army had its Masonic lodge; the most famous generals, such as Lafayette, Hoche, Kleber, Joubert and Kellermann, were active Freemasons. The emperor himself was a partisan of Volney's and of Charles Dupuis' astronomical explanation of the Gospels and was highly astonished to hear that Herder, Wieland and Goethe still believed in the historicity of Jesus. The conclusion of the concordat between the pope and Napoleon, strenuously opposed and bitterly ridiculed by many commanders of Napoleon's army, was a move inspired by the purely political motive to further everything that would renew the respect for authority and thus consolidate the new regime. Even the restored Bourbon monarchy with all its official show of piety and its consistent clericalism did not change the mentality of France as profoundly as is generally believed. Charles x was a thoroughgoing Voltairian skeptic; Joseph de Maistre, the father of the new reactionary "traditionalism," who pretended to derive all human knowledge from a primitive divine revelation, had been a very active Freemason before the revolution; Chateaubriand's correspondence shows the profound melancholy skepticism of the author of the celebrated *Génie du christianisme*, who had been a professed materialist in his early youth.

In spite of this persistent undercurrent of rationalist eighteenth century thought it cannot be denied that the monarchic restoration in France and the growth of romanticism there and in Germany carried in their wake a revival of religious feeling, a marked advance of Catholicism, a renewed worship of authority and tradition, a deeper understanding of the irrational side of the human mind and its important role in the growth of all human institutions. The idealization of the prerevolutionary past favored by the Restoration, the high tide of national feeling aroused through the reaction against Napoleonic universalist imperialism, favored the

Encyclopaedia of the Social Sciences

remarkable development of historical research which distinguished the nineteenth century from the rationalist age of d'Alembert, the mathematician and philosopher who was so devoid of historical sense that he would have gladly consigned to oblivion the whole memory of the irrational past of humanity. Yet this development of the historic sense not only restored the respect for tradition and authority but also fostered movements which gave in due time a new and most powerful incentive to free thought. Historical research could not progress without historical criticism, and the critical methods developed through a closer study of profane documents could not fail to be increasingly applied to the analysis of the sources of Biblical history. The belief in divinely inspired Scriptures embodying traditions based on divine revelations concerning the origins of the world and of mankind was shattered not only through historical criticism but also through the progress of oriental philology, which gradually unveiled the documents of other religions of a very different character yet equally claiming divine inspiration. Anquetil-Duperron had made accessible to the learned world the books of the *Zend-Avesta*; Jones and Colebrooke initiated the West into the studies of Sanskrit and the *Vedas*; Champollion had deciphered the Egyptian hieroglyphs; Grotefend and Rawlinson disclosed the secret of the cuneiform script. After having for many centuries dominated the various sciences as so many handmaidens religion (and its pseudo-scientific rationalization called theology) became in the nineteenth century more and more an object of scientific study and analysis: psychology helped to explain its roots in the mind of the individual; anthropology and sociology contributed to a better understanding of its collective aspect; comparative mythology starting with Fontenelle in the seventeenth century developed rapidly in the nineteenth and was popularized to the extent that Jefferson could dare to compare the dogma of the Immaculate Conception to the myth of Minerva springing full grown and armed out of the head of Jupiter.

But the greatest change in the attitude of man toward the traditional doctrine of a supernatural (i.e. magic) origin of the world and of life in it was worked through the gradual supplanting of the belief in creation by the hypothesis of evolution, which aimed at eliminating altogether the teleological point of view in favor of a purely causal explanation. Voltaire's deism still rested on the argument that the existence of a clock

proves the existence of a clock maker. That this argument completely vanished from the arsenal of nineteenth century metaphysics was due to nothing so much as to the growth of evolutionism. More than Darwin's own works the general reader was influenced by the writings of Ernst Haeckel in Germany and T. H. Huxley in Great Britain. Darwin had always been extremely reluctant to discuss the consequences which his theories might have for other people's religious convictions. While he and Huxley would not go beyond what the latter called, in his frequent controversies with Darwin's and his own theological adversaries, agnosticism (i.e. a wisely expectant attitude in all metaphysical questions), the German followers of Darwin inclined to a much more dogmatic materialism. With the combative Ludwig Feuerbach (1804-72) the extreme left wing of Hegelians had given up idealism as but another form of theology. In his *Das Wesen des Christenthums* (Leipsic 1841) Feuerbach developed the idea that uncultured man cannot conceive of the universal reason of the human race otherwise than under the anthropomorphic form of a personal god. Man personifies and separates from himself the element in his own nature which gives him moral laws and projects it into reality as something opposing his own will. Feuerbach showed the evolution of the idea of God, created by man in his own image, and denied energetically the belief in an immortality of the soul. The popular vogue of crude materialism had begun in Germany in 1854 when a lecture *Menschenschöpfung und Seelensubstanz* (Göttingen 1854) by the physiologist Rudolph Wagner of Göttingen, directed against the zoologist Karl Vogt's *Köhlerglaube und Wissenschaft* (Göttingen 1854), caused great excitement far beyond academic circles. A year later appeared Ludwig Büchner's *Kraft und Stoff* (Frankfort 1855) denying the possibility of creation because of the laws of the conservation of matter and energy. It was soon translated into many languages, republished in Reclam's library, sold in millions of copies and was thus raised to the dignity of a materialistic bible for the half-educated dabblers in applied science who had outgrown the tutorship of the church and its theology but were too lazy and obtuse to submit their minds to the discipline of epistemological studies. Jakob Moleschott's *Der Kreislauf des Lebens* (Mainz 1875) vied in popularity with Büchner's book, although Schopenhauer said—not altogether unjustly—that it seems to have been written by a barber's apprentice. In Ernst

Haeckel's *Welträtsel* (Bonn 1899) superficial materialism appeared under the new name of monism (as opposed to the dualism of Descartes and Kant). It was the first attempt of a synthetic philosophy on the basis of Darwinian evolutionism, a book full of anti-Christian polemic and cheap sarcasm, lacking the grace and spirit of Voltaire and disfigured by a great number of gross mistakes. The heated polemic with theologians of all denominations in which this book involved Haeckel induced him to organize the Freethinkers' Congress of Rome in 1904 and to found in 1906 the Deutsche Monisten-Bund.

This was by no means the first attempt at collective organization of the partisans of free thought. The most important of previous freethinkers' organizations was the International Freethinkers' League founded 1880 in Brussels, over the German branch of which, founded in 1881, Büchner presided until 1899. Since 1908 there has existed a Zentral-Verband der Proletarischen Freidenkern Deutschlands, reorganized in 1927 as a Verband für Freidenkertum und Feuerbestattung, with 500,000 members and a journal called the *Freidenker*. Since 1927 there has existed a German Volksbund für Geistesfreiheit, which publishes the *Geistesfreiheit*. The various organizations are loosely united in a cooperative Arbeitsgemeinschaft der Freigeistigen Verbände der Deutschen Republik. The working class freethinkers are united in the Bund Sozialistischer Freidenker, the communist atheists in the Internationale Proletarische Freidenker, which has had its center in Moscow since 1925. France has its Union de Libres Penseurs et de Libres Croyants and Société Rationaliste.

In England the free thought movement has been intimately associated with the movement for social reform. Paine, Owen, Hetherington, Holyoake, Bradlaugh and many other leading freethinkers were active in both fields. In 1852 Holyoake called a conference at Manchester for the organization of freethinkers' groups and in 1866 these were combined under the presidency of Charles Bradlaugh as the National Secular Society. This organization and the Rationalist Press Association, founded by Charles Albert Watts, counting many of the foremost leaders of English thought as members, have been the chief agents for the propagation of free thought in Great Britain. In the United States the tradition of Thomas Paine, the liberal heterodoxy of Emerson, the wide vogue of Colonel Robert Ingersoll and the scientific labors of Lester Ward

have been important stimulants to the development of freethinking. The American Rationalist Association, the American Secular Union and the Freethinkers of America all carry on a free-thinking propaganda, but the movement as such has never been as powerful as similar movements in Europe.

All these existent, flourishing, entirely secular societies of freethinkers are now entirely non-partisan organizations for the diffusion of free thought among the people by means of tracts, pamphlets, books and lectures. The center of attack of freethinkers has, however, shifted from primary concern with the divine foundations of religion and the historical accuracy of the Bible to a more militant onslaught upon the Christian elements in contemporary politics, morality and social questions. Their activities will remain necessary and beneficial as long as the hard won liberty of scientific research continues to be threatened by the religious instinct or by other herd instincts of the uncultured masses; as long as state religions and established churches continue to try to control elementary, secondary and even university education and to oppose on religious grounds urgently needed reforms of the state laws concerning marriage, divorce, birth control and the like, even as they opposed cremation, anaesthetic obstetrics and vaccination. Very often the freethinkers' clubs are frowned upon by scholars and the cultivated classes in general, not only because of the often shallow, coarse and superficial character of their propaganda but also because of the widespread tendency of the ruling classes to keep the proletariat under the influence of a religion of resignation and submission to social inequalities, a creed which Karl Marx has not inappropriately called an "opiate for the people." Ever since the philosopher Critias, one of the thirty tyrants of Athens, cynically taught that the gods had been invented by some "wise and sly man" in order to deter the people from doing secretly what the law forbade them to do in the open, a tendency has been prevalent among the ruling classes to preserve religion among the masses by means of a socially conservative clergy subservient to vested interests and to the powers that be, to limit the education of the lower classes to elementary—at the utmost to technical—instruction and to treat science and philosophy as esoteric privileges. The more the bourgeoisie fears social upheaval, the less willing will its press and publishing concerns, even the so-called liberal organs, be found to help in the fight for

the most precious of civic liberties, freedom of thought and word. In many republican countries big business has shown in recent days a marked tendency to favor the authority of the various churches; its deliberate fervor is not dissimilar from that which the Bourbons and the Hapsburgs displayed in the post-Napoleonic period.

Very different from these specifically propagandist organizations for the freedom of thought are the church and chapel-like associations of so-called freethinkers (more exactly free believers—*libres croyants*), who represent in reality nothing but the extreme, most radical development of Protestant freedom of conscience. Thus English deism (*q.v.*) was but a direct development of Socinianism, and English Unitarianism, pantheism and French positivism were directly descended from English deism. This genealogy explains the persistent tendency of these free believers to associate in a common cult and some sort of worshipful communion. Thus Toland in 1720 had proposed to found a deist *Sodalitas socratica*, for which his *Pantheisticon* was to serve as a liturgy. English Freemasonry (see MASONRY) developed on the continent into a *Société de pensée*, an anticlerical society for the propagation of tolerance and of a "natural religion" of humanity with an elaborate ritual. There have been and still are in Germany numerous chapel-like organizations of former Protestant freethinkers, such as the *Lichtfreunde* and the *Bund der Frei Religiösen Gemeinden*, trying to create something like a rationalist church with a symbolical, philosophical cult and ritual as a visible frame and expression of a humanitarian religion. In England, America, the Netherlands and Germany there is but a vague border line between the most liberal Protestant sects, such as the Unitarians, and the ethical societies of professed freethinkers, like the International Order for Ethics and Culture, founded in 1908 in Berne.

In France Rousseau had expressed the desire that natural religion should become an official and compulsory faith, within which, however, the individual would be free to cultivate his distinctive tenets as he chose. Auguste Comte gave a churchlike organization, the Church of Humanity, to the faithful adherents of his philosophical system, the *Société Positiviste*, founded in 1848, with a calendar of the great benefactors of humanity instead of the Catholic saints, with a catechism of positive religion and even with a renewed tendency to restrict the freedom of

scientific research by forbidding "useless speculations." A Positivist church survives to this day in London and the movement has had a great influence on the ideology of English trade unionism and on liberal political movements in various countries.

Church and chapel-like associations of this kind rest on the assumption of the English deists that Christianity freed from irrational dogmas and from all supernatural elements is identical with a self-evident ethical system which must of necessity be recognized as a valid obligation by all men. This naive idea was not challenged until the great immoralist Friedrich Nietzsche revived the polemic arguments of antiquity against Judaeo-Christian democratic, humanitarian ethics, based on pity and sympathy with human suffering, on humility and renunciation; this he characterized as a slave morality invented to protect the sickly and unfit poor against the beneficial rule of the strong, rich and noble, who will in due time give birth to the superman. Whatever may be said for or against this haughty thesis, the class conditioned character of the Jewish prophets' "cry for justice" and of the teaching of Jesus is now patent to all, as is the conservative social tendency of the age long interpretation and adaptation to which these teachings have been subjected by the theologians of the different churches. No one today will consider the particular ethical doctrines of modern, or for that matter of ancient, Christianity as self-evident or natural or as the morality common to all men. The modern relativist theory of values has definitely shattered the basis on which such artificial churches as the various ethical societies or orders rested.

FRENCH REVOLUTION. There are many approaches to the cataclysm which overturned the institutions of France and degenerated rapidly into a bitter warfare of twenty-three years between the young democracy and its monarchical neighbors.

There is the purely French approach, such as that of de Tocqueville or Taine. For the former the revolution in unifying France was but the achievement of the work of centralization begun by the absolute monarchy; the Committee of Public Safety was the legitimate heir of Francis I, of Richelieu and of Colbert. For Taine, concerned more with ideas than events, the revolution was the product of the classic spirit—of that lucidity of analysis and abstraction which characterized the golden age of French literature but which subsequently became crystallized and emptied of all real content.

For present day historians, more disposed to emphasize the European angle and more conversant with the doctrines of historical materialism, the French Revolution is merely the outstanding episode of a much vaster tragedy, whose protagonist is the bourgeoisie. Such is the thesis of Jean Jaurès. While skilfully using the authority of the Feuillant, Barnave, as a cloak for his own conception of the close and inevitable parallelism between the economic and the political movements, Jaurès succeeded in orienting the French Revolution in terms of contemporary Europe, in explaining clearly why the crisis broke out in France rather than in England or Germany or Italy.

The English bourgeoisie, which for a century had been in possession of political power, was enjoying the fruits of the industrial revolution, then in its first flush. It was not bothered by the crown and had nothing to gain from attacking the feudal orders either lay or ecclesiastical since both had been dispossessed. There were no class discriminations in the levying of taxes, no restrictions on circulation within the country, no abusive regulations. Individual liberty went hand in hand with religious toleration. The freehold tenant, accorded the franchise, was essentially conservative in temperament. Satisfied interests make poor revolutionaries. Alarmed by Burke as to the possible consequences of the French Revolution, English landed proprietors arrayed

themselves behind Pitt to meet the threat by war.

In Germany and Italy the minute parceling out of land and the particularism of the small princes were sufficient to prevent a concerted movement of any vitality. The faint beginnings of industrialism in Germany were confined to three or four localities, and the German bourgeoisie had as yet no conception of its strength, no ambition to power. It was content to vegetate in the shadow of the royal or princely houses.

The outbreak of the revolution in France rather than elsewhere may be attributed not only to the fact that the French bourgeoisie had become increasingly powerful because commerce had quadrupled since 1714, that monarchical centralization facilitated a concerted movement, that the writings of the *philosophes*, especially of the physiocrats, had kindled discontent and formulated in advance a program of reforms, but primarily to the fact that the resistance of the nobility, which had become increasingly powerful throughout the entire century, had produced a situation where the prerequisite of progress was force. In an age characterized by enlightened despotism France alone clung to the outworn tradition of autocracy.

The feudal reaction, which began as far back as Louis XIV, continued throughout the eighteenth century. The *parlements*, whose members had come to constitute the dynamic force within the nobility, took the lead. Now that they had become nobles themselves and owners of fiefs they perverted the *arrêts de justice*, which had formerly been instruments for protecting the rights of the king or the public interest, to the service of the feudal lords, sanctioning their encroachments on the common property. In the second half of the century especially, there was a multiplication of hunting preserves and *triages* with a correspondingly increased number of peasants deprived of their traditional rights. In the place of the older monarchical maxim, "Fief and jurisdiction have nothing in common," the new feudal jurists—Boutaric, Fréminville, Renaudon—substituted a maxim purely feudal, inspired by Montesquieu: "Fief and jurisdiction are one."

The feudal reawakening manifested itself not only in changes in jurisprudence but also in the increasingly arrogant claims of the provincial estates, whose encroachments on the royal power proceeded with remarkably few pauses. In the province of Brittany, for instance, the administration of the tax passed almost entirely from

the hands of the intendant to those of the estates. The offensive of the nobles eventuated in the reconstitution, which ordinarily accompanied augmentation of feudal dues, of the officials known as *chartriers*, or guardians of title deeds.

But above all else the opposition of the *parlements* to every share of reform completely enfeebled the monarchy and drove it to bankruptcy. The magistrates not only set the bad example of resisting the orders of the king but in their remonstrances formulated a program of representative monarchy which was later to be turned to profitable use by the insurgent bourgeoisie.

While the nobles of the robe were thus undermining confidence in the very foundations of absolute monarchy the economists and especially the physiocrats were waging against the time honored economic institutions an increasingly ardent and fruitful campaign. Organs of agrarian and industrial capitalism with a veneration for private property, they advocated the suppression of all regulations and corporations and the establishment of absolute commercial liberty. The ancient artisan class, which had been the symbol of the union between the petty bourgeoisie and the king, tottered under the assaults of ministers won over to the new doctrines. But the large manufacturers, who for a century had been fighting the corporations and who were practically exempt from public burdens, were still unsatisfied with the partial reforms made in their behalf. Now that they were meeting with the nobles in the councils of administration of the new joint stock companies they felt themselves their equals since they enjoyed the same rights. Their ambition was kindled and they were no longer to be content with half measures. It is an eloquent commentary that the first revolutionary assembly in 1789 was held in the chateau of the great metallurgist Périér at Vizille in Dauphiné and that noble, bourgeois and priest plotted together to change the social order.

The campaign of the physiocrats combined with the anti-administrative assaults of the *parlements* had seriously impaired the royal prerogatives in the economic sphere. Hitherto the king as the personification of the public interest had been able to issue decrees whenever an economic crisis seemed to necessitate recourse to such measures, limiting the exercise of property rights—even to the extent of imposing a tax on prices. The rights of the individual were subordinated to the rights of society. But now the situation was

reversed. The right of property appears as prior and superior to the state—to the king. The duty of the state consists solely in protecting liberty and property; it has no other justification. In the past, law had been no more than the expression of the personal will of the king. The physiocrats succeeded in transforming it into an eternal impersonal truth of the natural order, which independent of the monarch limits his sovereignty. The ideal government is that which is reduced to its simplest expression and which leaves the maximum of control to the great social forces. Physiocratic utilitarianism was the antithesis of the old Christian morality—a point of contact with the *philosophes*, who in addition welcomed from the physiocratic program all those elements conducive to the rise of capitalism.

The revolution existed in the realm of ideas from the middle of the century. It was carried over into the realm of actuality not only by the intransigency of the *parlements* and the partial application of the program of the physiocrats but also by the incoherence of the king's political policy.

The feudal reawakening seconded by the *arrêts de justice* subjected the peasants more grievously to the seigniorial yoke. The nobility attempted to reestablish itself in rural society in the midst of its former serfs. The aristocracy which the revolution had to fight was not a detached, passive class, but on the contrary a class which was awake to the economic life going on around it and swayed by new and mounting ambitions. The succession of edicts between 1761 and 1785 dealing with enclosures, with the old pasturage lands, with the dividing up of the commons, with the clearing of land, made it obvious to the peasants that the king was deliberately abandoning them in favor of their natural enemies.

The intermittent freedom of grain exportation caused an increase in the price of bread at the very time when royal taxation was increasing. In the single *bailliage* of Reims royal taxation tripled or quadrupled during the period from 1704 to 1788. From 1765 to 1789 prices doubled, while salaries averaged only a 10 to 20 percent increase. The growing overpopulation produced a huge proletariat both rural and urban, which furnished the revolution with the man power for its mobs.

Hitherto the monarchy had rested upon the traditional docility of the French artisanry, on the fidelity of the army, on the loyalty of the intendants, on the gospel of resignation preached by the clergy. One after another these supports

crumbled. The artisans, especially after Turgot's taxation of them, considered themselves sacrificed to the manufacturers. The army became permeated with the spirit of reform, which was still heightened, especially among the young nobles, by the American Revolution. The intendants, no longer men of the people as under Louis XIV but instead recruited from the nobility, to whose interests they catered, displayed less and less zeal. The lower clergy instead of counseling submission began to advance claims.

Brienne's very attempt to counteract the feudal claims of the *parlements* and of the provincial estates by the creation of provincial assemblies—hybrid bodies, more consultative than representative—precipitated the crisis which was generally expected. This crisis continued for at least a dozen years. It described an ascending curve toward democracy until the fall of Robespierre, 9 Thermidor, year II. Thereupon it descended again to the bourgeois oligarchy of the Directory, to eventuate finally in the Napoleonic dictatorship, which endured despite its suppression of public liberties by reason of its consolidation of the material and legal accomplishments of the revolution. It is a question really not of a single revolution but of a series of different revolutions bound together by an inner logic.

In the first of these revolutions, which extended from the convocation of the Notables by Calonne in 1787 to the assembling of the Estates General in 1789, only the privileged classes were involved. It was begun by the nobility of the robe, who were joined immediately by the nobles of the sword and the higher clergy. In order to safeguard their fiscal immunities against the threat of the new schemes of taxation these privileged orders struck a blow at the royal government, thereby setting a bad example to the lower classes. The significance of this prelude to the revolution is too often ignored. It is extremely important to note that the monarchy was threatened by its own agents. The revolt was not yet the work of a political party or the outgrowth of a conspiracy. Political parties did not exist. There was no plot, no secret organization planning a sudden overthrow of secular institutions and the substitution of others. On the contrary, it was in the name of the past through invocation of time honored customs—of the rules of feudal law—that the *parlements* unleashed resistance and revolt.

The role of conspiracy which is sometimes attributed to Freemasonry is pure legend. The lodges in the period before 1789 bore no resem-

blance except in their ritual to continental Freemasons' lodges of the present day. They were composed of *grands seigneurs*, of officers, of priests, of rich bourgeois. Salons rather than clubs, they were frequented by the flower of the army, by men of the world, by champions of the status quo. Their members celebrated the Feast of St. John the Baptist by a solemn mass. Their activities were never, as is evidenced by the reports of the intendants, a source of disquietude to those in authority. Louis XVI and his brothers, Marie Antoinette herself, participated in the ceremonies at the Loge des Trois Frères in the Versailles district. More than three fourths of the French Freemasons, especially those in the military lodges, became émigrés. The smallness of the minority which aligned itself on the side of the revolution eliminates the possibility that the movement of 1789 was the result of a Masonic conspiracy.

The insurgent forces at the outset were the constituted bodies of the states—the *parlements* and the Notables. The revolution was cast within the existing mold. These judges, these Notables, were the representatives of a class which was no longer satisfied with its privileges and which desired through the attainment of dominant political power to rejuvenate them.

But this first revolution, superficial and ephemeral, soon brought in its train a second, more profound and utterly different. Behind the judges, behind the nobles, behind the priests, was the bourgeoisie, which toward the end of 1788 pushed its way to the front. It became aroused for a variety of reasons. Royal absolutism constituted as grievous a burden to the bourgeoisie as to the privileged classes, while the imminent bankruptcy of the government threatened to engulf bourgeois property. Finally, the bourgeoisie felt itself capable of assuming in its turn the direction of the state in order to free itself from those legal encumbrances which held it down as a vassal and prisoner of the unproductive and privileged classes. It was suspicious of a revolution by the noble and feudal class and in order to forestall such a contingency it went into action under the banner of unwritten natural law, which it opposed to feudal law.

From the outset the bourgeoisie possessed the double advantage of wealth and intellect. Since most of the writers were in its ranks, control of public opinion was guaranteed. In addition it controlled the army, for the soldiers, to whom the higher ranks were closed, perceived in the revolution the path to opportunity. This

bourgeois revolt, which followed on the heels of the revolt of the nobility, was not apparently the result of long premeditation or the outgrowth of a conspiracy. It was for that reason all the more vigorous. It was the expression of reflections stored up from the reading of authors who for fifty years had been criticizing existing institutions, and it was infected with the contagious enthusiasm of the American precedent.

The influence of abstract thinkers on great social crises has sometimes been denied. "The most eloquent dissertations on revolution," writes Georges Sorel, metaphysician of revolutionary syndicalism, "have no practical issue, and the course of history is not altered by literature." If this statement implies simply that literature alone is incapable of bringing about a social movement it is on firm ground; but if it pretends that literature is an utterly negligible factor it lays itself open to serious question. The great majority of men are unaware of injustice until it is pointed out to them. The denunciation of abuses is an essential preliminary to a demand for reform; a clearly formulated ideal, the prerequisite of a loyal following. It is extremely doubtful whether without the writings of the *philosophes* the bourgeoisie would have risen in 1789 with the same unanimity, the same resoluteness; whether without the writings of Karl Marx the Russian Revolution would have been the same. Robespierre without Rousseau remains an enigma; so does Lenin without Marx.

The revolt of the judges and the Notables, being essentially a revolt of officially constituted bodies, did not have to build up a special organization. The bourgeoisie faced an entirely different problem. Almost from the outset the nucleus of the organization consisted in meetings sponsored by the "Américains" at the homes of Lafayette and the councilor Adrien Duport. It was from these centers that the Société des Trente despatched orders to the barristers and lawyers who carried them into effect in their respective local provinces. In Burgundy the detection of the movement of the corporations and the supervision of elections were in the hands of the lawyers. In Brittany the law students of Rennes under the leadership of Moreau, the future general, took up arms against the nobles and in the course of the fighting were supported by reinforcements sent from youthful bourgeois in adjoining towns.

Proof that the entire movement was the execution of a carefully coordinated and matured plan may be found in the universal application

of the same tactics and in the formulation—even in the *cahiers de doléances* drawn up on the eve of the election—of the same general claims. From the east to the west, from the north to the south, the revolutionary bourgeoisie extended one hand to the peasants, the other to the curés and the lower clergy, with a view to binding together, as in a *fascis*, all the potential forces of renovation. So permeated were they with a jealous class spirit that in accordance with the counsels of the abbé Sieyès they elected the deputies who should represent them in the Estates General almost exclusively from the third estate.

At Versailles the leaders became aware almost immediately of the necessity of a compact organization in order to present a solid front to the court and to the privileged classes. On the eve of the opening they assembled at the Club Breton, which became the cradle of the Club des Jacobins. Victory depended, it was felt, on their remaining in close contact with the masses and on their ability to match force with force. Accordingly they entered into endless correspondence with their constituents both to stimulate their zeal and to keep them posted concerning the difficulties encountered at Versailles. Several of these correspondences have been published, and constitute—especially those of the lawyer Bouchette, of the curé Barbotin and of Duquesnoy from Lorraine—documents of great interest. When the king called out the troops following the tennis court oath, the correspondents encouraged the bourgeois of Paris to form the national guard, which was to become the military force of the revolution. After the fall of the Bastille permanent committees, i.e. revolutionary and dictatorial municipalities, which spread as if by magic through France, hastened to distribute arms to their partisans. From that time on the *ancien régime* was defeated, inasmuch as the bourgeoisie had taken possession of both the municipal administration and the public forces. By the side of the permanent committees and the national guards were shortly created the clubs which formed a federation under the direction of the Jacobins. The club was the organ of surveillance. It was wide awake to the dangers that threatened the revolution. At the time of the convention there were no fewer than four or five thousand clubs at work. In all this activity the French were merely following the example of the permanent committees, the militia and the clubs which had been such significant factors in the prosecution of the American Revolution. Revolutions are contagious.

Vaulting into power on the fourteenth of July the bourgeoisie proceeded to intrench itself. It restored the king to the helm by a constitution which guaranteed his political power. It lowered the clergy and the nobility to its own level by writing large into the constitution equality before the law. Deviating from the real spirit of the Declaration of Rights it refused the franchise to the unpropertied classes, who were rated as passive citizens. To save the property owners threatened with bankruptcy it confiscated church property and offered it for sale by the ingenious system of assignats. An immense transfer of property resulted.

The work of reconstruction proceeded parallel to the work of destruction. Above the débris of the privileged classes and the suppressed orders the Assembly erected a logical and harmonious structure. Its foundation was the Declaration of the Rights of Man and the Citizen (*q.v.*)—the document which was to instal individualism as the dominant feature of the modern world. This eloquent apostrophe to personal initiative, to the force of individualism, was heard from afar and provided for the revolution itself a magic spring of energy endlessly renewed. The dawn of romanticism was already coloring the horizon.
